tory Wagtail will build her nest in the accustomed spot, and year after year the migratory Cuckoo will deposit her eggs in that nest, and yet in each interval of time the former may have passed some months on the shores of the Mediterranean, and the latter, absent for a still longer period, may have wandered into the heart of Africa.<sup>1</sup> The writer cannot offer an approach to the solution of this mystery. There was a time when he had hopes that what is called the "homing" faculty in Pigeons might furnish a clue, but Mr Tegetmeier and all the best authorities on that subject declare that a knowledge of landmarks obtained by sight, and sight only, is the sense which directs these Birds, while sight alone can hardly be regarded as affording much aid to Birds—and there is reason to think that there are several such—which at one stretch transport themselves across the breadth of Europe, or even traverse more than a thousand miles of open ocean, to say nothing of those—and of them there are certainly many—which perform their migrations by night. That particular form of Bluethroat which yearly repairs to breed upon the mosses of the Subalpine and Northern parts of Scandinavia (*Cyanecula suecica*) is hardly ever seen in Europe south of the Baltic.<sup>2</sup> Throughout Germany it may be said to be quite unknown, being replaced by a conspicuously different form (*C. leucocyana*), and as it is a Bird in which the collectors of that country, a numerous and well-instructed body, have long taken great interest, we are in a position to declare that it is not known to stop in its transit from its winter haunts, which we know to be Egypt and the valley of the Upper Nile, to its breeding-quarters. Other instances, though none so crucial as this, could be cited from among European Birds were there room here for them. In New Zealand there are two Cuckoos which are annual visitors: one, a species of *Chrysococcyx*, is supposed to come from Australia, the other, *Eudynamis taitensis* is widely spread throughout Polynesia, yet both these birds yearly make two voyages over the enormous waste of waters that surrounds the country to which they resort to breed. But space would utterly fail us were we to attempt to recount all the examples of these wonderful flights. Yet it seems impossible that the sense of sight should be the faculty whereby they are so guided to their destination, any more than in the case of those which travel in the dark.

Dr von Middendorff (*op. cit.* p. 9), from the conclusions he has drawn, as before mentioned, as to the spring-movement of all birds in the Russian Empire being towards the Taimyr Peninsula, the seat of one of the magnetic poles, has suggested that the migrating Bird is always aware (he does not sufficiently explain by what means) of the situation of this point, and thus knows how to steer its course. Not only is this hypothesis unsupported by any considerations known to the writer, but it is not at all borne out by the observed facts of Migration in North America, where Birds as has been shewn by Professor Baird (*op. cit.* p. 347) do not migrate in the direction of the magnetic pole.

Other authors there are who rely on what they call "instinct" as an explanation of this wonderful faculty. This with them is simply a way of evading the difficulty before us, if it does not indeed remove the question altogether from the domain of scientific inquiry. Rejecting such a mode of treatment, Herr Palmén meets it in a much

fairer spirit. He asserts (*op. cit.* p. 195) that migrants are led by the older and stronger individuals among them, and, observing that most of those which stray from their right course are yearlings that have never before taken the journey, he ascribes the due performance of the flight to "experience." But, granting the undisputed truth of his observation, his assertion seems to be only partially proved. That the birds which lead the flock are the strongest is on all accounts most likely, but what is there to show that these are also the oldest of the concourse? Besides this, there are many Birds which cannot be said to migrate in flocks. While Swallows, to take a sufficiently evident example, conspicuously congregate in vast flocks and so leave our shores in large companies, the majority of our summer-visitors slip away almost unobserved, each apparently without concert with others. It is also pretty nearly certain that the same species of Bird does not migrate in the same manner at all times. When Skylarks arrive on our north-eastern coast in autumn they come flitting over in a constant, straggling stream, not in compact flocks, yet a little later these same birds collect in enormous assemblages which prosecute their voyage in company. It is indeed possible that each bird of the stream intentionally follows that which goes before it, though in a long sea-passage it must be hard to keep the precursor in sight, and it may perhaps be granted that the leader of the whole is a bird of experience. But then we must consider not these cases only, but also those of Birds which do not migrate in company, and we must also have regard to what is implied in the word "experience." Here it can only signify the result of knowledge acquired on former occasions, and obtained by sight. Now it was stated by Temminck<sup>3</sup> many years ago, and so far as would appear the statement has not been invalidated, that among migrants the young and the old always journey apart and most generally by different routes. The former can have no "experience," and yet the greater number of them safely arrive at the haven where they would be. The sense of sight, essential to a knowledge of landmarks, as we have above attempted to demonstrate, is utterly insufficient to account for the success that attends Birds which travel by night, or in a single flight span oceans or continents. Yet without it the idea of "experience" cannot be substantiated. We may admit that inherited but unconscious experience, which is really all that can be meant by instinct, is a factor in the whole matter—certainly, as Mr Wallace seems to have proved, in originating the migratory impulse, but yet every aspect of the question is fraught with difficulty, and we must leave to time the discovery of this mystery of mysteries.

There yet remain a few words to be said on what may be termed Exceptional Migration, that is when from some cause or other the ordinary practice is broken through. This differs from the chance occurrence of the waifs and strays with which this section of the article began in that the Birds subject to it keep in a great measure their customary habit of migrating, and yet are compelled to indulge it in an irregular, or perhaps an altogether novel, manner, though they are not entirely the sport of circumstances. The erratic movements of the various species of Crossbill (*Loxia*) and some allied forms afford perhaps the best-known examples. In England no one can say in what part of the country or at what season of the year he may not fall in with a company of the Common Crossbill (*L. curvirostra*), and the like may be said of many other lands. The food of these Birds consists mainly of the seeds of conifers, and as its supply in any one locality is intermittent or precarious, we may not unreasonably guess that

<sup>1</sup> Absolute proof of the identity of the particular birds is of course wanting, but if that objection be raised the circumstance becomes still more puzzling, for then we have to account for some mode of communicating precise information by one bird to another.

<sup>2</sup> It has occurred indeed as a straggler to about a dozen instances in England, and it arrives twice a year in greater or less numbers in Heligoland as reported by the ever-watchful observer on that island, Mr Galke, to whom ornithologists are so deeply indebted for his long-continued and intelligent scrutiny of the extraordinary number of wandering birds which alight there.

<sup>3</sup> *Manual d'Ornithologie*, lii. introd. p. xliii. note.

they shift from place to place in its quest, and may thus find an easy way of accounting for their uncertain appearance. The great band of Nutcrackers (*Yucifraga caryocatactes*) which in the autumn of 1844 pervaded Western and Central Europe<sup>1</sup> may also have been actuated by the same motive, but we can hardly explain the roaming of all other Birds so plausibly. The inroads of the Waxwing (*Ampelis garrulus*) have been the subject of interest for more than 300 years, and by persons prone to superstitious auguries were regarded as the forerunners of dire calamity. Sometimes years have passed without its being seen at all in Central, Western, or Southern Europe, and then perhaps for two or three seasons in succession vast flocks have suddenly appeared. Later observation has shown that this species is as inconstant in the choice of its summer-as of its winter-quarters, and though the cause of the irregularity may possibly be of much the same kind as that just suggested in the case of the Crossbill, the truth awaits further investigation.<sup>2</sup> One of the most extraordinary events known to ornithologists is the irruption into Europe in 1863 of Pallas's Sand-Grouse (*Syrnhaptes paradoxus*). Of this Bird, hitherto known only as an inhabitant of the Tartar steppes, a single specimen was obtained at Sarepta on the Volga in the winter of 1848. In May 1859 a pair is said to have been killed in the Government of Vâna on the western borders of the Russian Empire, and a few weeks later five examples were procured, and a few others seen, in Western Europe—one in Jutland, one in Holland, two in England, and one in Wales. In 1860 another was obtained at Sarepta; but in May and June 1863 a horde computed to consist of at least 700 individuals overran Europe—reaching Sweden, Norway, the Færoes, and Ireland in the north-west, and in the south extending to Sicily and almost to the frontiers of Spain. On the sandhills of Jutland and Holland some of these birds bred, but war was too successfully waged against the nomades to allow of their establishing themselves, and a few survivors only were left to fall to the gun in the course of the following winter and spring.<sup>3</sup> In the summer of 1872, another visitation to Great Britain was reported, but if it really took place it must have been that of a very small number of birds, and it was not observed on the Continent. Speculation has amused itself by assigning causes to these movements but the real reason remains in doubt.

We cannot quit the subject of Migration, however, without referring to the wonderful assemblages of Birds which have in various places been time and again noticed by night. Towards the close of summer, in dark, cloudy, and still weather, it not unfrequently happens that a vast and, to judge from their cries, heterogeneous concourse of Birds may be heard hovering over our large towns. The practical ornithologist will recognize the notes of Plover, Sandpiper, Tern, and Gull, now faint with distance and then apparently close overhead, while occasionally the stroke of a wing may catch his ear, but nothing is visible in the surrounding gloom. Sometimes but a few fitful wails are heard, of which only an expert listener will know the meaning. At others the continuous Babel of sounds will ensure the attention of the most incurious. It is supposed that these noises proceed from migrating birds, which, having lost their way, are attracted by the glare of the street lamps, but far too little has been observed to remove the obscurity that in a double sense surrounds them and to enable us to come to any definite conclusion. It must be added also that such a concourse has been noticed where the fascina-

tion of light did not exist, for Lord Lilford has recorded<sup>4</sup> how that once at Corfu he was startled by an uproar as if all the feathered inhabitants of the great Acherusian Marsh had met in conflict overhead, but he could form no conception of what birds produced the greater part of it.

### SONG.

Leaving then the subject of Migration, the next important part of the economy of Birds to be considered is perhaps their Song—a word, however, in a treatise of this kind to be used in a general sense, and not limited to the vocal sounds uttered by not more than a moiety of the feathered races which charm us by the strains they pour from their vibrating throat,—strains indeed denied by the scientific musician to come under cognizance as appertaining to his art, but strains which in all countries and in all ages have conveyed a feeling of true pleasure to the human hearer, and strains of which by common consent the Nightingale is the consummate master. It is necessary in a philosophical spirit to regard every sound made by a Bird under the all-powerful influence of love or lust as a "Song." It seems impossible to draw any but an arbitrary line between the deep booming of the Emen, the harsh cry of the Guillemot (which, when proceeding from a hundred or a thousand throats, strikes the distant ear in a confused murmur like the roar of a tumultuous crowd), the plaintive wail of the Plover, the melodious whistle of the Widgeon, "the Cock's shrill clarion," the scream of the Eagle, the hoot of the Owl, the solemn chime of the Bell-bird, the whip-cracking of the Manakin, the Chaffinch's joyous burst, or the hoarse croak of the Raven, on the one hand, and the bleating of the Snipe<sup>5</sup> or the drumming of the Ruffed Grouse, on the other. Innumerable are the forms which such utterances take. In many birds the sounds are due to a combination of vocal and instrumental powers, or, as in the cases last mentioned, to the latter only. But, however produced—and of the machinery whereby they are accomplished there is not room here to speak—all have the same cause and the same effect. The former has been already indicated, and the latter is its consummation. Almost coinstantaneously with the hatching of the Nightingale's brood, the song of the sire is hushed, and the notes to which we have for weeks hearkened with rapt admiration are changed to a guttural croak, expressive of alarm and anxiety, inspiring a sentiment of the most opposite character. No greater contrast can be imagined, and no instance can be cited which more completely points out the purpose which "Song" fulfils in the economy of the bird, for if the Nightingale's nest at this early time be destroyed or its contents removed, the cock speedily recovers his voice, and his favourite haunts again resound to his bewitching strains. For them his mate is content again to undergo the wearisome round of nest-building and incubation. But should some days elapse before disaster befalls their callow care, his constitution undergoes a change and no second attempt to rear a family is made. It would seem as though a mild temperature, and the abundance of food by which it is generally accompanied, prompt the physiological alteration which inspires the males of most birds to indulge in the "Song" peculiar to them. Thus after the annual moult is accomplished, and this is believed to be the most critical epoch in the life of any bird, cock Thrushes, Skylarks, and others begin to sing, not indeed with the jubilant voice of spring but in an

<sup>1</sup> Bull. de l'Acad. de Bruxelles, xi. p. 293.

<sup>3</sup> *Ibid.*, 1864, pp. 185–222. A few additional particulars which have since become known to the writer are inserted above.

<sup>4</sup> *Ibid.*, 1865, p. 176.

<sup>5</sup> The true cause of this sound has been much discussed, but Huxley's explanation (*Proc. Zool. Soc.* 1858, p. 302), based on experiment, seems to be correct, though it is far from being generally accepted.

uncertain cadence which is quickly silenced by the super-vention of cold weather. Yet some birds we have which, except during the season of moult, hard frost, and time of snow, sing almost all the year round. Of these the Red-breast and the Wren are familiar examples, and the Chiff-chaff repeats its two-noted cry, almost to weariness, during the whole period of its residence in this country.<sup>1</sup>

Akin to the "Song" of Birds, and undoubtedly proceeding from the same cause, are the peculiar gestures which the males of many perform under the influence of the approaching season of pairing, but these again are far too numerous here to describe with particularity. It must suffice to mention a few cases. The Ruff on his hillock in a marsh holds a war-dance. The Snipe and some of his allies mount aloft and wildly execute unlooked for evolutions almost in the clouds. The Woodcock and many of the Goatsuckers beat evening after evening the same aerial path with its sudden and sharp turnings. The Ring-Dove rises above the neighbouring trees and then with motionless wings slides down to the leafy retreat they afford. The Caperally and Blackcock, perched on a commanding eminence, throw themselves into postures that defy the skill of the caricaturist—other species of the Grouse-tribe assume the strangest attitudes and run in circles till the turf is worn bare. The Peacock in pride spreads his train so as to shew how nearly akin are the majestic and the ludicrous. The Bower-bird, not content with his own splendour, builds an arcade, decked with bright feathers and shining shells, through and around which he paces with his gay companions. The Larks and Pipits never deliver their song so well as when seeking the upper air. Rooks rise one after the other to a great height and, turning on their back, wantonly precipitate themselves many yards towards the ground, while the solemn Raven does not scorn a similar feat, and, with the tenderest of croaks, glides supinely alongside or in front of his mate.<sup>2</sup>

#### NIDIFICATION.

Following or coincident with the actions just named, and countless more besides, comes the real work of the breeding-season, to which they are but the prelude or the accompaniment. Nidification is with most birds the beginning of this business—but with many it is a labour that is scamped if not shirked. Some of the Auk tribe place their single egg on a bare ledge of rock, where its peculiar conical shape is but a precarious safeguard when rocked by the wind or stirred by the thronging crowd of its parents' fellows. The Stone-Curlew and the Goatsucker deposit their eggs without the slightest preparation of the soil on which they rest, yet this is not done at haphazard, for no birds can be more constant in selecting, almost to an inch, the very same spot which year after year they choose for their procreant cradle. In marked contrast to such artless care stand the wonderful structures which others, such as the Tailor-bird, the Bottle-Titmouse, or the Fantail-Warbler build for the comfort or safety of their young. But every

variety of disposition may be found in the Class. The Apteryx seems to entrust its abnormally big egg to an excavation among the roots of a tree-fern, while a band of female Ostriches scrape holes in the desert-sand and therein promiscuously dropping their eggs cover them with earth and leave the task of incubation to the male, who discharges the duty thus imposed upon him by night only, and trusts by day to the sun's rays for keeping up the needful, fostering warmth. The Megapodes raise a huge hotbed of dead leaves wherein they deposit their eggs and the young are hatched without further care on the part of either parent. Some of the Grebes and Rails seem to avail themselves in a less degree of the heat generated by vegetable decay, and dragging from the bottom or sides of the waters they frequent fragments of aquatic plants form of them a rude half-floating mass which is piled on some growing water-weed—but these birds do not spurn the duties of maternity. Many of the Gulls, Sandpipers, and Plovers lay their eggs in a shallow pit which they hollow out in the soil, and then as incubation proceeds add thereto a low breastwork of haulm. The Ringed Plover commonly places its eggs on shingle, which they so much resemble in colour, but when breeding on grassy uplands it paves the nest-hole with small stones. Pigeons mostly make an artless platform of sticks so loosely laid together that their pearly treasures may be perceived from beneath by the inquisitive observer. The Magpie, as though self-conscious that its own thieving habits may be imitated by its neighbours, surrounds its nest with a hedge of thorns. Very many birds of almost every group bore holes in some sandy cliff, and at the end of their tunnel deposit their eggs with or without bedding. Such bedding, too, is very various in character—thus while the Shelduck and the Sand-Martin supply the softest of materials the one of down from her own body, the other of feathers collected by dint of diligent search,—the Kingfisher forms a couch of the undigested spiny fish-bones which she ejects in pellets from her own stomach. Other birds, as the Woodpeckers, hew holes in living trees even when the timber is of considerable hardness, and thereby establish their nursery. Some of the Swifts secrete from their salivary glands a fluid which rapidly hardens as it dries on exposure to the air into a substance resembling isinglass, and thus furnish the "edible birds' nests" that are the delight of Chinese epicures. In the architecture of nearly all the Passerine birds, too, some salivary secretion seems to play an important part. By its aid they are enabled to moisten and bend the otherwise refractory twigs and straws and glue them to their place. Spiders' webs also are employed with great advantage for the purpose last mentioned, but perhaps chiefly to attach fragments of moss and lichen so as to render the whole structure less obvious to the eye of the spoiler. The Tailor-bird deliberately spins a thread of cotton and therewith stitches together the edges of a pair of leaves to make a receptacle for its nest. Beautiful too is the felt fabricated of fur or hairs by the various species of Titmouse while many birds ingeniously weave into a compact mass both animal and vegetable fibres, forming an admirable non-conducting medium which guards the eggs from the extremes of temperature outside. Such a structure may be open and cup-shaped, supported from below as that of the Chaffinch and Goldfinch, domed like that of the Wren and Bottle-Titmouse, slung hammock-wise as in the case of the Golden-crested Wren and the Orioles, or suspended by a single cord as with certain Grosbeaks and Humming-birds. Under such circumstances it is even sometimes needful to balance the nest lest the weight of the growing young should destroy the equipoise and, precipitating them on the ground, dash the hopes of the parents, and compensation in such cases is applied by loading the opposite

<sup>1</sup> A curious question, which has as yet attracted but little attention, is whether the notes of the same species of Bird are in all countries alike. From his own observation the writer is inclined to think that it is not, and that there may exist "dialects," so to speak, of the song. (*Cf. Gloger, Jour. für Orn.* 1859, p. 393.)

<sup>2</sup> No comprehensive account of the Song of Birds seems ever to have been written. The following may be cited as the principal treatises on the subject.—Barnington, *Phil. Trans.* 1773, pp. 249–291; Kennedy, *N. Abhandl. über Akad. (Phil. Abhandl.)* 1797, p. 169; Blackwall, *Moth. Lit. and Phil. Soc. Manch.* 1824, pp. 289–323; Savart, (*Fronep's*) *Notulen u. s. v.* 1826, pp. 1–10, 20–25; Brehm and Hansmann, *Neumann's*, 1855, pp. 64–59, 96–101, 181–195, and *Journ. für Orn.* 1855, pp. 348–351, 1856, pp. 250–255. The notes of many of our common Birds are musically expressed by Mr Harting, *Birds of Middlesex* (London: 1866).

side of the structure with lumps of earth: Certain Warblers (*Aedon* and *Thamnobia*) for some unascertained reason invariably lay a piece of snake's slough in their nests—to repel, it has been suggested, marauding lizards who may thereby fear the neighbourhood of a deadly enemy. The clay-built edifices of the Swallow and Martin are known to everybody, and the Nuthatch plasters up the gaping mouth of its nest-hole till only a postern large enough for entrance and exit, but easy of defence, is left. In South America we have a family of birds (*Furnariidae*) which construct on the branching roots of the mangrove globular ovens, so to speak, of mud, wherein the eggs are laid and the young hatched. The Flamingo erects in the marshes it frequents a mound of earth some two feet in height, with a cavity atop, on which the hen, having oviposited, sits astride with dangling legs, and in that remarkable attitude is said to perform the duty of incubation. The females of the Hornbills, and perhaps of the Hoopoes, submit to incarceration during this interesting period, the males immuring them by a barrier of mud, leaving only a small window to admit air and food, which latter is assiduously brought to the prisoners.

Occasional  
departure  
from  
habits.

But though in a general way the dictates of hereditary instinct are rigidly observed by birds, in many species a remarkable degree of elasticity is exhibited or the rule of habit is rudely broken. Thus the noble Falcon, whose ordinary eyry is on the beetling cliff, will for the convenience of procuring prey condescend to lay its eggs on the ground in a marsh, or appropriate the nest of some other bird in a tree. The Golden Eagle, too, remarkably adapts itself to circumstances, now rearing its young on a precipitous ledge, now on the arm of an ancient monarch of the forest and again on a treeless plain, making a humble home amid grass and herbage. Herons also show the same versatility and will breed according to circumstances in an open fen, on sea-banks or (as is most usual) on lofty trees. Such changes are easy to understand. The instinct of finding food for the family is predominant, and where most food is there will the feeders be gathered together. This explains, in all likelihood, the associated bands of Ospreys or Fish-Hawks, which in North America breed (or used to breed) in large companies where sustenance is plentiful, though in the Old World the same species brooks not the society of aught but its mate. Birds there are of eminently social predilections. In Europe, excepting Sea-fowls—whose congregations are universal and known to all—we have perhaps but the Heron, the Fieldfare, and the Rook, which habitually flock during the breeding-season; but in other parts of the world many birds unite in company at that time, and in none possibly is this habit so strongly developed as in the Anis of the Neotropical Region, the Republican Swallow of North America, and the Sociable Grosbeak of South Africa, which last joins nest to nest until the tree is said to break down under the accumulated weight of the common edifice.<sup>1</sup>

Birds  
breeding  
in socie-  
ties.

Parasitic  
Birds.

In the strongest contrast to these amiable qualities is the parasitic nature of the Cuckows of the Old World and the Cow-birds of the New, but this peculiarity of theirs is so well known that to dwell upon it would be needless. Enough to say that the egg of the parasite is introduced

into the nest of the dupe, and after the necessary incubation by the fond fool of a foster-mother the interloper successfully counterfeits the heirs, who perish miserably, victims of his superior strength. The whole process has been often watched, but the reflective naturalist will pause to ask how such a state of things came about, and there is not much to satisfy his enquiry. Certain it is that some birds whether by mistake or stupidity do not unfrequently lay their eggs in the nests of others. It is within the knowledge of many that Pheasants' eggs and Partridges' eggs are often laid in the same nest, and it is within the knowledge of the writer that Gulls' eggs have been found in the nests of Eider-Ducks, and *vice versa*; that a Redstart and a Pied Flycatcher will lay their eggs in the same convenient hole—the forest being rather deficient in such accommodation; that an Owl and a Duck will resort to the same nest-box, set up by a scheming woodsman for his own advantage; and that the Starling, which constantly dispossesses the Green Woodpecker, sometimes discovers that the rightful heir of the domicile has to be brought up by the intruding tenant. In all such cases it is not possible to say which species is so constituted as to obtain the mastery, but it is not difficult to conceive that in the course of ages that which was driven from its home might thrive through the fostering of its young by the invader, and thus the abandonment of domestic habits and duties might become a direct gain to the evicted householder. This much granted, all the rest will follow easily enough, but it must be confessed that this is only a presumption, though a presumption which seems plausible if not likely.

#### EGGS.

The pains bestowed by such Birds (incomparably the most numerous of the Class), as build elaborate nests and the devices employed by those that, not doing so, display no little skill in providing for the preservation of their produce, invite some attention to the eggs which they lay. This attention will perhaps be more cheerfully given when we think how many naturalists, not merely ornithologists, have been first directed to the study of the animal kingdom by the spoils they have won in their early days of birds' nesting. With some such men the fascination of this boyish pursuit has maintained its full force even in old age—a fact not so much to be wondered at when it is considered that hardly any branch of the practical study of Natural History brings the enquirer so closely in contact with many of its secrets. It is therefore eminently pardonable for the victims of this devotion to dignify their passion by the learned name of "Oology," and to bespeak for it the claims of a science. Yet the present writer—once an ardent follower of the practice of birds'-nesting, and still on occasion warming to its pleasures—must confess to a certain amount of disappointment as to the benefits it was expected to confer on Systematic Ornithology, though he yields to none in his high estimate of its utility in acquainting the learner with the most interesting details of bird-life—without a knowledge of which nearly all systematic study is but work that may as well be done in a library, a museum, or a dissecting-room, and is incapable of conveying information to the learner concerning the why and the wherefore of such or such modifications and adaptations of structure. To some—and especially to those who are only anatomists—this statement may seem preposterous, but it is in truth no such thing. What engineer can be said to understand his business if he knows not the purpose to which the machines he makes are to be applied and is unacquainted with their mode of working? We may investigate thoroughly the organs of any animal, we may trace them from the earliest moment in which they become defined, and

Birds'  
nesting.

Its use.

<sup>1</sup> There are not many works on nidification, for "Galiology" or the study of nests has hardly been deemed a distinct branch of the science. A good deal of instructive matter (not altogether free from error) will be found in Reppie's *Architecture of Birds* (London: 1831), and there is Mr Wallace's most interesting dissertation, "A Theory of Birds' Nests," originally published in the *Journal of Travel and Natural History* (1868, p. 73), and reprinted in his *Contributions to the Theory of Natural Selection* (London: 1870). Mr Andrew Murray's and the Duke of Argyll's remarks on this essay are contained in the same volume of the *Journal* named (pp. 137 and 276).

watch them as they develop to maturity, we may comprehend the way in which every part of a complicated structure is successively built up, but if we take not the trouble to know their effect on the economy of the creature we as naturalists have done but half our task and abandon our labour when the fullness of reward is coming upon us. The field-naturalist, properly instructed, crowns the work of the comparative anatomist and the physiologist, though without the necessary education he is little more than an empiric, even should he possess the trained cunning of the savage on whose knowledge of the habits of wild animals depends his chance of procuring a meal.

Discoveries  
of oolo-  
gists.

Perhaps the greatest scientific triumph of oologists lies in their having fully appreciated the intimate alliance of the *Limicolæ* (the great group of Snipes and Plovers) with the *Gaviæ* (the Gulls, Terns, and other birds more distantly connected with them) before it was recognized by any professed taxonomist,—L'Hermulier, whose researches have been much overlooked, excepted; though to such an one was given the privilege of placing that affinity beyond cavil (Huxley, *Proc. Zool. Soc.* 1867, pp. 426, 456-458; cf. *Ibis*, 1868, p. 92). In like manner it is believed that oologists first saw the need of separating from the true *Passeres* several groups of birds that had for many years been unhesitatingly associated with that very uniform assemblage. Diffidence as to their own capacity for meddling with matters of systematic arrangement may possibly have been the cause which deterred the men who were content to brood over birds' eggs from sooner asserting the validity of the views they held. Following the example furnished by the objects of their study, they seem to have chiefly sought to hide their offspring from the curious eye—and if such was their design it must be allowed to have been admirably successful. In enthusiastic zeal for the prosecution of their favourite researches, however, they have never yielded to, if they have not surpassed, any other class of naturalists. If a storm-swept island, only to be reached at the risk of life, held out the hope of some oological novelty there was the egg-collector (Faber, *Isis*, xx. pp. 633-688; Proctor, *Naturalist*, 1838, pp. 411, 412). Did another treasure demand his traversing a burning desert (Tristram, *Ibis*, 1859, p. 79) or sojourning for several winters within the wildest wastes of the Arctic Circle (Wolley, *Ibis*, 1859, pp. 69-76; 1861, pp. 92-106; Kennicott, *Rep. Smithsonian Inst.* 1862, pp. 39, 40), he endured the necessary hardships to accomplish his end, and the possession to him of an empty shell of carbonate of lime,<sup>1</sup> stained or not (as the case might be) by a secretion of the villous membrane of the parent's uterus, was to him a sufficient reward. Taxonomers, however, have probably been right in not attaching too great an importance to such systematic characters as can be deduced from the eggs of birds, but it would have been better had they not insisted so strongly as they have done on the infallibility of one or another set of characters, chosen by themselves. Oology taken alone proves to be a guide as misleading as any other arbitrary method of classification, but combined with the evidence afforded by due study of other particularities, whether superficial or deep-seated, it can scarcely fail in time to conduct us to an ornithological arrangement as nearly true to Nature as we may expect to achieve.

The first man of science who seems to have given any special thought to oology, was the celebrated Sir Thomas Browne, of Norwich, who already in 1681, when visited by John Evelyn (from whose diary we learn the fact), had assigned a place in his cabinet of rarities to a collection of birds' eggs. The next we hear of is that Count of Marsigli

who early in the eighteenth century explored, chiefly for this kind of investigation, the valley of the Danube—a region at that time, it is almost unnecessary to remark, utterly unknown to naturalists. But there is no need to catalogue the worthies of this study. As they approach our own day their number becomes far too great to tell, and if very recently it has seemed to dwindle the reason is probably at hand in the reflection that most of the greatest prizes have been won, while those that remain to reward the aspiring appear to be just now from one cause or another almost out of reach. Perhaps at the present time the Birds-of-Paradise and their allies form the only group of any recognized distinctiveness and extent of whose eggs we know absolutely nothing—though there are important isolated forms, such as *Atrichua*, *Heterolocha*, and others, concerning the eggs as well as the breeding habits of which our ignorance is absolute, and the species of many families that have hitherto defied the zeal of oologists are very numerous. These last, however, though including some common and some not very uncommon British birds, possess in a general way comparatively little interest, since, the eggs of their nearest allies being well known, we cannot expect much to follow from the discovery of the recluses, and it is only to the impassioned collector that the obtaining of such desiderata will afford much satisfaction.

The first thing which strikes the eye of one who be- Varied holds a large collection of egg-shells is the varied hues of hues of the specimens. Hardly a shade known to the colourist is eggs. not exhibited by one or more, and some of these tints have their beauty enhanced by the glossy surface on which they are displayed, by their harmonious blending, or by the pleasing contrast of the pigments which form markings as often of the most irregular as of regular shape. But it would seem as though such markings, which a very small amount of observation will shew to have been deposited on the shell a short time before its exclusion, are primarily and normally circular, for hardly any egg that bears markings at all does not exhibit some spots of that form, but that in the progress of the eggs through that part of the oviduct in which the colouring matter is laid on many of them become smeared, blotched, or protracted in some particular direction. The circular spots thus betoken the deposition of the pigment while the egg is at rest, the blurred markings show its deposition while the egg is in motion, and this motion would seem often to be at once onward and rotatory, as indicated by the spiral markings not uncommonly observable in the eggs of some Birds-of-prey and others—the larger end of the egg (when the ends differ in form) making way for the smaller.<sup>2</sup> At the same time the eggs of a great number of birds bear, beside these last and superimposed markings, more deeply-seated stains, generally of a paler and often of an altogether different hue, and these are evidently due to some earlier dyeing process. The peculiar tint of the ground-colour, though commonly superficial, if not actually congenital with the formation of the shell, would appear to be suffused soon after. The depth of colouring whether original or super- Ground-vening is obviously dependent in a great measure on the constitution or bodily condition of the parent. If a bird, bearing in its oviduct a fully-formed egg, be captured, that egg will speedily be laid under any circumstances of inconvenience to which its producer shall be subjected, but such an egg is usually deficient in coloration—fright and

Forms of  
markings.

Ground-  
colour.

<sup>1</sup> A small proportion of carbonate of magnesia and phosphate of lime and cupreous also enters into its composition.

<sup>2</sup> That the larger end is protruded first was found on actual experiment by Mr Bartlett, Superintendent of the Gardens of the Zoological Society, to be the case commonly, but as an accident the position may be sometimes reversed, and this will most likely account for the occasional deposition of markings on the smaller instead of the larger end as not infrequently shown in eggs of the Sparrow-hawk (*Accipiter nisus*). The head of the chick is always formed at the larger end.

captivity having arrested the natural secretions. In like manner over excitement or debility of the organs, the consequence of ill health, give rise to much and often very curious abnormality. It is commonly believed that the 'older a bird is the more intensely coloured will be its eggs, and to some extent this belief appears to be true. Certain *Falconidae*, which ordinarily lay very brilliantly-tinted eggs, and are therefore good tests, seem when young unable to secrete so much colouring-matter as they do when older, and season after season the dyes become deeper, but there is reason to think that when the bird has attained its full vigour improvement stops, and a few years later the intensity of hue begins to decline. It would be well if we had more evidence, however, in support of this opinion, which is chiefly based on a series of eggs of one species—the Golden Eagle (*Aquila chrysaetus*), in the writer's possession, among which are some believed on good grounds to have been the produce in the course of about twelve years of one and the same female. The amount of colouring-matter secreted and deposited seems notwithstanding to be generally a pretty constant quantity—allowance being made for individual constitution; but it often happens—especially in birds that lay only two eggs—that nearly all the dye will be deposited on one of these, leaving the other colourless; it seems, however, to be a matter of inconstancy which of the two is first developed. Thus of two pairs of Golden Eagles' eggs also in the possession of the writer, one specimen of each pair is nearly white while the other is deeply coloured, and it is known that in one case the white egg was laid first and in the other the coloured one. When birds lay many mottled, and *a fortiori* plain, eggs, there is generally less difference in their colouring, and though no two can hardly ever be said to be really alike, yet the family resemblance between them all is obvious to the practised eye. It would seem however to be a peculiarity with some species—and the Tree-Sparrow (*Passer montanus*) which lays five or six eggs may be taken as a striking example—that one egg should always differ remarkably from the rest of the clutch. In addition to what has been said above as to the deposition of colour in circular spots indicating a pause in the progress of the egg through one part of the oviduct, it may be observed that the cessation of motion at that time is equally shewn by the clearly defined hair-lines or vermiculations seen in many eggs, and in none more commonly met with than in those of the Buntings (*Emberizidae*). Such markings must not only have been deposited while the egg was at rest, but it must have remained motionless until the pigment was completely set, or blurred instead of sharp edges would have been the result.<sup>1</sup>

Nature of  
pigment.

The composition of this pigment has long excited much curiosity, and it has been commonly and rather crudely ascribed to secretions of the blood or bile,<sup>2</sup> but very recently unexpected light has been shed upon the subject by the researches of Mr Sorby (*Proc. Zool. Soc.* 1875, p. 351), who, using the method of spectrum-analysis, has now ascertained the existence of seven well-marked substances in the colouring-matter of eggs, to the admixture of which in certain proportions all their tints are due. These he names

Oorhodeine, Oocyan, Banded Oocyan, Yellow Ooxanthine, Rufous Ooxanthine, a substance, giving narrow absorption-bands in the red, the true colour of which he has not yet been able to decide, and lastly Lichenoxanthine. It would be out of place here to particularize their chemical properties, and it is enough to say that they are closely connected either with hæmoglobin or bile-pigments, and in many respects resemble the latter more than do any other group of colouring-matters, but do not actually agree with them. The first is perhaps the most important of all the seven, because it occurs more or less in the shells of so great a number of eggs that its entire absence is exceptional, and it is of a very permanent character, its general colour being of a peculiar brown-red. The second and third seem when pure to be of a very fine blue, but the spectrum of the former shows no detached bands, while that of the latter has a well-marked detached absorbent-band near the red end, though the two are closely related since they yield the same product when oxidized. The fourth and fifth substances supply a bright yellow or reddish-yellow hue, and the former is particularly characteristic of eggs of the Emeus (*Dromæus*), giving rise when mixed with oocyan to the fine malachite-green which they possess, while the latter has only been met with in those of the Tinamous (*Tinamidae*), in which it should be mentioned that oorhodeine has not been found, or perhaps in those of a Cassowary (*Casuarus*), and when mixed with oocyan produces a peculiar lead-colour. The sixth substance, as before stated, has not yet been sufficiently determined, but it would seem in combination with others to give them an abnormally browner tint; and the seventh appears to be identical with one which occurs in greater or less amount in almost all classes of plants, but is more especially abundant in and characteristic of lichens and fungi. There is a possibility however of this last being in part if not wholly due to the growth of minute fungi, though Mr Sorby believes that some such substance really is a normal constituent of the shell of eggs having a peculiar brick-red colour. That gentleman is further inclined to think that oorhodeine is in some way or other closely related to cruentine, being probably derived from the red colouring-matter of the blood by some unknown process of secretion, and likewise that there is some chemical relation between the oocyans and the bile.

The grain of the egg-shell offers characters that deserve far more consideration than they have received until lately, when the attention of Herr von Nathusius having been directed to the subject by some investigations carried on by Dr Landois<sup>3</sup> and Herr Rudolf Blasius,<sup>4</sup> he has brought out a series of remarkable papers<sup>5</sup> in which he has arrived at the conclusion that a well-defined type of shell-structure belongs to certain families of birds, and is easily recognized under the microscope. In some cases, as in the eggs of certain Swans and Geese (*Cygnus olor* and *C. musicus*, *Anser cinereus* and *A. segetum*) even specific differences are apparent. The bearing of these researches on classification generally is of considerable importance and must be taken into account by all future taxonomers. Here we cannot enter into details, it must suffice to remark that the grain of the shell is sometimes so fine that the surface is glossy, and this is the case with a large number of *Picariæ*, where it is also quite colourless and the contents of their eggs seen through the semi-transparent shell give an

<sup>1</sup> The principal oological works with coloured figures are the following:—Thunemann, *Fortpflanzungsgeschichte der gesammten Vögel* (4to, Leipzig, 1845); Lefèvre, *Atlas des œufs des oiseaux d'Europe* (8vo, Paris, 1845); Hewitson, *Coloured Illustrations of the Eggs of British Birds* (8vo, Ed. 3, London, 1856); Brewer, *North American Oology* (4to, Washington, 1859); Taczanowski, *Oologia Ptaków Polskich* (8vo, Warszawa, 1862); Badeker, *Die Eier der Europäischen Vögel* (fol. Leipzig, 1863); Wolley, *Ootheca Wolleyana* (8vo, London, 1864)—some of which have never been completed; but a great number of rare eggs are also figured in various journals, as the *Proceedings of the Zoological Society*, *Naumannia*, the *Journal für Ornithologie*, and *The Ibis*.

<sup>2</sup> Cf. Wülke, *Naumannia*, 1853, pp. 393-397. and C. Leconte, *Revue Magazine de Zoologie*, 1860, pp. 199-205.

<sup>3</sup> *Zeitschr. für wissenschaft. Zoologie*, xv. pp. 1-31

<sup>4</sup> *Op. cit.* xviii. pp. 480-524.

<sup>5</sup> *Op. cit.* xviii. pp. 19-21, pp. 225-270, xix. pp. 322-348, xx. pp. 106-130, xxi. pp. 330-335. A summary of these will be found in *Journ. für Ornith.* 1871, pp. 241-260, and the subject has been continued in the same periodical for 1872, pp. 321-332, and 1874, pp. 1-26.

opalescence of great beauty; out among the Tinamous (*Tinamides*) colour is invariably present and their opaque eggs present the appearance of more or less globular balls of highly-burnished metal or glazed porcelain. Most birds lay eggs with a smooth shell, such as nearly all the *Gaviæ*, *Limicolæ*, and *Passeres*, and in some groups, as with the normal *Gallinæ*, this seems to be enamelled or much polished, but it is still very different from the brilliant surface of those just mentioned, and nothing like a definite line can be drawn between their structure and that in which the substance is dull and uniform, as among the *Alcidæ* and the *Accipitres*. In many of the *Ratitæ* the surface is granulated and pitted in an extraordinary manner,<sup>1</sup> and in a less degree the same feature is observable in the eggs of some other birds, as the Storks (*Ciconiide*). Many Water-fowls, and particularly the Ducks (*Anatidæ*), lay eggs with a greasy or oleaginous exterior, as the collector who wishes to inscribe his specimens with marks of their identity often finds to his inconvenience; but there are other eggs, as those of the Anis (*Crotophaga*), the Grebes (*Podicipedidæ*), and all of the *Steganopodes*, except *Phaeton*, which are more or less covered with a cretaceous film, often of considerable thickness and varied by calcareous protuberances.

Form of  
eggs.

In form eggs vary very much, and this is sometimes observable in examples not only of the same species but even from the same mother, yet a certain amount of resemblance is usually to be traced according to the natural group to which the parents belong. Those of the Owls (*Strigidæ*) and of some of the *Picariæ*—especially those which lay the glossy eggs above spoken of—are often apparently spherical, though it is probable that if tested mathematically none would be found truly so—indeed it may be asserted that few eggs are strictly symmetrical, however nearly they may seem so, one side bulging out, though very slightly, more than the other. The really oval form, with which we are most familiar, needs no remark, but this is capable of infinite variety caused by the relative position and proportion of the major and minor axes. In nearly all the *Limicolæ* and some of the *Alcidæ* the egg attenuates very rapidly towards the smaller end, sometimes in a slightly convex curve, sometimes without perceptible curvature, and occasionally in a sensibly concave curve. The eggs having this pyriform shape are mostly those of birds which invariably lay four in a nest, and therein they lie with their points almost meeting in the centre and thus occupying as little space as possible and more easily covered by the brooding parent. Other eggs as those of the Sand-Grouse (*Pterodromidæ*) are elongated and almost cylindrical for a considerable part of their length terminating at each end obtusely, while eggs of the Grebes (*Podicipedidæ*) which also have both ends nearly alike but pointed, are so wide in the middle as to present a biconical appearance.<sup>2</sup>

Size of  
eggs.

The size of eggs is generally but not at all constantly in proportion to that of the parent. The Guillemot (*Alca troile*) and the Raven (*Corvus corax*) are themselves of about equal size; their eggs vary as ten to one. The Snipe (*Scelopax gallinago*) and the Blackbird (*Turdus merula*) differ but slightly in weight, their eggs remarkably. The eggs of the Guillemot are as big as those of an Eagle; and those of the Snipe equal in size the eggs of a Partridge (*Perdix cinerea*). Mr Hewitson, from whom these instances

are taken, remarks:—"The reason of this great disparity is, however, obvious; the eggs of all those birds which quit the nest soon after they are hatched, and which are consequently more fully developed at their birth, are very large."<sup>3</sup> It must be added, though, that the number of eggs to be covered at one time seems also to have some relation to their size, and this offers a further explanation of the fact just mentioned with regard to the Snipe and the Partridge—the former being one of those birds which are constant in producing four, and the latter often laying as many as a dozen—for the chicks of each run as soon as they release themselves from the shell.

Incubation is performed, as is well known, by the female Incubator of nearly all Birds, but with most of the *Passeres* and many others the male seems to share her tedious duties, and among the *Ratitæ*, apparently without exception, the cock takes that office wholly on himself. There are a few groups or perhaps species in which the same practice is suspected to obtain—certain of the *Limicolæ* for instance, the Godwits (*Limosa*), the Phalaropes (*Phalaropus*), and two Dotterel (*Eudromias morinellus*)—and in these it is to be remarked that the hen is larger and more brightly coloured than her mate. Owing to the unfortunate neglect of those who have the opportunity of making the useful observations the period of Incubation has been ascertained in comparatively few birds, and it is here possible to deal with that subject only in the most vague and general language. It may be asserted that most of the smaller *Passeres* of Europe hatch their young in about thirteen days, but in a few species the term is believed to be shortened to ten or eleven days, while in the largest of that Order, the Raven, it is lengthened to some twenty-one days. This also is the period which the Barndoor-fowl ordinarily takes, but the Pheasant, though so very nearly allied, takes about twenty-eight. Most Water-birds, so far as is known, and the smaller Birds-of-prey seem to require as long a time, but in the Swan incubation is protracted to six weeks. The temperature of the air is commonly credited with having something to do either in hastening or retarding exclusion from the egg, but to what extent, or even whether justly so or not, seems in the absence of precise experiments to be doubtful. Certain birds occasionally begin brooding as soon as the first egg is laid,<sup>4</sup> and this plan unquestionably has its advantages, since the offspring being of different ages thereby become less of a burthen on the parents which have to minister to their wants, while the fostering warmth of the earlier chicks can hardly fail to aid the development of those which are unhatched, during the absence of father and mother in search of food; but most birds, and it need scarcely be said, all those the young of which run from their birth, await the completion of the clutch before sitting is begun. The care bestowed, by almost every species, on the infant-brood, is proverbial, and there is hardly any extremity of danger which one at least of the anxious parents will not incur to ward off injury from their progeny.

#### MOULT.

The more or less protracted business of reproduction being ended there forthwith follows in the case of nearly all Birds a process of the most vital consequence to them. This is the Moulting or shedding of their old and often weather-beaten feathers to be replaced by an entirely new suit. It is probably the severest strain to which bird-life is exposed, and, to judge from its effects on our domesticated pets, produces a greater mortality than an occasional want

<sup>1</sup> It is curious that Ostriches' eggs from North Africa are to be readily distinguished from those from the Cape of Good Hope by their smooth ivory-like surface, without any punctures, whereas southern specimens are rough as though pock-marked (*Ibis*, 1860, p. 74), yet no difference that can be deemed specific has as yet been established between the birds of the north and of the south.

<sup>2</sup> A great deal of valuable information on this and other kindred subjects is given by Des Murs, *Traité général d'Oologie ornithologique* 8vo, Paris: 1860.

<sup>3</sup> Hewitson, *op. cit.* Introd. p. x.

<sup>4</sup> This seems to be very often the case with the Owls, but if the writer's observation is not mistaken the habit is not constant even with the same individual bird.

of proper or even any food does. Important however as are its bearings on every individual of the whole Class, the subject is one which has been sadly neglected by ornithological writers and, with one exception,<sup>1</sup> we are not aware of any connected series of observations on Moulting within the whole range of their literature. The structure and mode of growth of feathers has been very well studied and described by several investigators, and must be especially treated in introducing the subject of Pterylography—or the disposition of the various plumed patches on the bird's body—which, having been found to be a most useful auxiliary in Classification, is deferred until that comes to be discussed under the article "ORNITHOLOGY." For the present we have briefly to consider the different phases which the process of Moulting offers.

As a general rule all Birds are subject to an annual Moulting, and this as above stated, commonly begins immediately on the close of the breeding-season, but, as will be explained further on, there are some which undergo in addition a second or even a third partial change of plumage, and it is possible that there may be others still more exceptional, our information respecting these, however, is too meagre to make it worth while saying anything here about them. It must be acknowledged that with regard to the great majority of forms we can only judge by analogy, and though it may well be that some interesting deviations from the general rule exist of which we are altogether ignorant, yet when we consider that the *Ratitæ*, so far as observed, moult exactly in the same manner as other birds,<sup>2</sup> the uniformity of the annual change may be almost taken for granted.

It is not intended here to describe the way in which a feather dies and a new one succeeds it, nor need we compare the process of moulting with the analogous shedding of the hair in Mammals or of the skin in Reptiles. Enough for our present purpose to see that such renovation is required in Birds, which nearly all have to depend upon their quills for the means of locomotion and hence of livelihood. It is easy to understand that durable as are the flight-feathers, they do not last for ever and are besides very subject to accidental breakage, the consequence of which would be the crippling of the bird. It is obviously to provide against what in most cases would be such a disaster as this last that we find the *remiges*, or quill-feathers of the wings, to be always shed in pairs. They drop out not indeed absolutely at the same moment, though this sometimes seems to happen, but within a few days of each other, and, equilibrium being thus preserved, the power of flight is but slightly deteriorated by their temporary loss. The same may be observed in a less degree, since there is less need of regularity, with the rest of the plumage, as a little attention to any tame bird will show, and the new feathers grow at an almost equal rate. In the young of most species the original quills are not shed during the first year, nor in the young of many does there seem to be an entire moult during that time, but in the typical *Gallinæ*, which are able to fly at a very early age, often before they are one-third grown, the original quills, being proportioned to the duties required of them, are shed before the bird has attained its full size and are succeeded by others that serve it when it has reached maturity. In the Duck-tribe (*Anatidæ*), however, we have a very singular exception to what has been above stated. Most of these birds shed their quill-feathers all at once, and become absolutely incapable of

flight for a season,<sup>3</sup> during which time they generally seek the shelter of thick, aquatic herbage, and it is further to be particularly remarked that the males of most of two sections of the family (*Anatidæ* and *Fuliginidæ*) at the same period lose the brilliantly-coloured plumage which commonly distinguishes them and "go into eclipse," as Waterton happily said, putting on for several weeks a dingy garb much resembling that of the other sex, to resume their gay attire only when, their new quills being grown, it can be safely flaunted in the open air. Here we have the first instances of Additional Moulting to be mentioned. Another is not less interesting, though ornithologists must confess with shame that they have not sufficiently investigated it. This is that of the Ptarmigan (*Lagopus mutus*), both sexes of which not only moult after the breeding-season is over into a grey suit, and then again as autumn passes away into their snowy winter-clothing, but, divesting themselves of this last in spring, then put on each a third and most distinctive dress—these changes, however, do not extend to the quills either of the wings or tail.<sup>4</sup>

The number of Birds which undergo a more or less entire Double Moulting is very considerable, and the peculiarity is not always characteristic of families or even, unless in a restricted sense, of genera. Thus while the Garden-Warbler (*Sylvia salicaria*) is said to moult twice in the year the Blackcap (*S. atricapilla*) does so but once. The same may be said of the *Emberizidæ*, in which family both practices seem to obtain, but on the other hand the distinction in this respect between the Larks (*Alaudidæ*) and the Pipits (*Anthinæ*), belonging to the family *Motacillidæ*, appears, so far as our knowledge goes, to be invariable, though the habits and general appearance of both groups are so much alike—the *Alaudidæ* moulting but once and the *Anthinæ*, conforming to the practice of the normal *Motacillidæ* (*Motacillina*), twice a year—the quills, be it understood, excepted. But it would be impossible here to give more than these few examples, and indeed we scarcely know anything of the subject outside of groups belonging to the Northern hemisphere.<sup>5</sup>

In a large number of species the Additional Moulting is very partial, being often limited to certain portions of the plumage, and it is yet an unsolved problem how far some of the changes to be observed are due to actual Moulting and how far to the alteration of colour in the feathers themselves, as also the way by which this alteration of colour is produced, whether, as certainly happens in many instances, by the dropping off of the "barbicels"—the fine filaments that fringe the "barbicels" which are arranged on the upper surface of each "barb" composing the web of the feather—or in some other manner. With either of these last considerations we need not now concern ourselves. It is unquestionable that there are innumerable species of birds, the males at least of which put forth in spring decorative plumes unknown at any other season, and it would appear that in the majority of them the feathers which before clothed the parts whence the newly-donned ornaments grow are doffed to make room for these paraphernalia of marriage.

The subject of Additional Moulting is thus intimately connected with the seasonal adornment of Birds, and as that

<sup>1</sup> This is a valuable paper by Herr Meves, of Stockholm (*Öfvers. K. Vet. Akad. Förhandl.* 1854, p. 258), of which a German translation with some additions by the author may be found in *Journ. für Ornith.* 1855, pp. 230-238.

<sup>2</sup> For the knowledge of this fact the writer is indebted to the vast experience of Mr. Bartlett.

<sup>3</sup> One species, *Micropterus cinereus*, seems never to regain the power of flight thus lost. Cf. Cunningham, *Proc. Zool. Soc.* 1871, p. 262.

<sup>4</sup> Macgillivray (*Brit. Birds*, i. p. 196, London: 1837; and *Nat. Hist. of Deeside*, p. 405, London: 1855) thought there were four moults in this species, but that seems to be one too many. Herr Meves (*loc. cit.*) and the Abbé Caire (*Rev. Zool.* 1854, p. 494) independently made the discovery of the Triple Moulting, and almost simultaneously announced it. Cf. Gloger, *Journ. für Orn.* 1856, p. 461.

<sup>5</sup> The fullest list as yet published is that of Herr Meves (*ut supra*), but it is but entirely free from error.

properly belongs to a branch of the great question of Natural Selection, its further consideration must here be put off until that is more fully treated, together with what are known as the "Laws of Plumage," the reader being meanwhile referred to those excellent chapters in which Mr Darwin<sup>1</sup> has treated the matter with his usual perspicuity, though even he has far from exhausted its varied points of interest.

It remains to be remarked that though the annual Moults

<sup>1</sup> *The Descent of Man and Selection in Relation to Sex*, chaps. xiii-xvi. London: 1871.

commonly takes place so soon as the breeding-season is over, there are plenty of cases where we find the change delayed to a later period of the year. This is so with the Swallow (*Hirundo rustica*), which has long been known to moult in midwinter, and it is generally the way with all the Diurnal Birds-of-prey. But unquestionably most birds accomplish the change much earlier, and before they leave their breeding-quarters for their winter-haunts, thereby starting on one of their great annual journeys with all the external machinery of flight renewed and in the best condition for escaping its attendant perils. (A. N.)

skull, and the skin is then dried in a smoky hut. The Great Emerald Bird, so far as yet known, is only found in the Arn Islands. The Lesser Bird of Paradise (*Paradisæ minor*), though smaller in size and somewhat less brilliant in plumage, in other respects closely resembles the preceding species. It is also more common, and much more widely distributed, being found throughout New Guinea and the neighbouring islands. Its plumes are those most generally used as ornaments for ladies' head-dresses. It has been brought alive to Europe, and has been known to live for two years in the gardens of the Zoological Society of London. Both species are omnivorous, feeding voraciously on fruits and insects. They are strong, active birds, and are believed to be polygamous. The King Bird of Paradise (*Cicinnurus regius*) is one of the smallest and most brilliant of the group, and is specially distinguished by its two middle tail feathers, the ends of which alone are webbed, and coiled into a beautiful spiral disc of a lovely emerald green. In the Red Bird of Paradise (*Paradisæ rubra*) the same feathers are greatly elongated and destitute of webs, but differ from those in the other species, in being flattened out like ribbons. They are only found in the small island of Waigiu off the coast of New Guinea. Of the Long-billed Paradise Birds (*Epimachida*) the most remarkable is that known as the "Twelve-wired" (*Sclerocides alba*), its delicate yellow plumes, twelve of which are transformed into wire-like bristles nearly a foot long, affording a striking contrast to the dark metallic tints of the rest of its plumage. Like the *Paradisæ* they feed on insects and fruits.

BIRKBECK, GEORGE, an English physician and philanthropist, born at Settle in Yorkshire in 1776. He early evinced a strong predilection for scientific pursuits; and in 1799, after graduating as doctor of medicine, he was appointed to the chair of natural philosophy at the Andersonian Institution of Glasgow. In the following year he delivered, for the benefit of the working-classes, a gratuitous course of scientific lectures, which were continued during the two following years and proved eminently successful. He removed to London in 1804, and there he endeavoured to prosecute his philanthropic schemes, at first without much encouragement, but ultimately with marked success. In 1827 he contributed to found the Mechanics' Institute, his coadjutors being Bertham, Wilkie, Cobbett, and others. He was appointed director of the institute, which he had originally endowed with the sum of £3700, and held the office till his death in December 1841.

BIRKENHEAD, a seaport, market-town, extra-parochial district, township, and parliamentary borough, in the hundred of Wirral and west division of Cheshire, England. It is situated on the western bank of the Mersey, directly opposite Liverpool. It is of considerable antiquity, its history dating from 1150, when a priory was founded in honour of St Mary and St James by the third baron of Dunham Massey, and had considerable endowments. The priors sat in the parliaments of the earls of Chester, and enjoyed all the dignities and privileges of palatinate barons. A fine crypt and some interesting ruins of the priory still exist. From a comparatively obscure fishing village Birkenhead has become a large and important town, with a rapidity truly marvellous. The inhabitants numbered only 200 in 1821; in 1831 they were 2569; the following table shows the increase since 1841:—

| Year. | Population      | Dwelling Houses | Rateable Value. |
|-------|-----------------|-----------------|-----------------|
| 1841  | 8227            | 1466            | £44,000         |
| 1851  | 25,000          | 4148            | 114,301         |
| 1861  | 37,796          | 5239            | 150,827         |
| 1871  | 45,418          | 7511            | 219,011         |
| 1875  | (estim.) 52,000 | 8000            | 228,909         |

Birkenhead began to develop itself as a market-town in the year 1833, when an Act was obtained for paving, lighting, watching, cleansing, and improving the town, and for regulating the police and establishing a market. By this Act the Improvement Commissioners were originally constituted, and at that time included the mayor, bailiffs, and four aldermen of Liverpool. Immediately after the passing of this Act the town made rapid progress. The principal streets were laid out on a regular plan, intersecting each other at right angles. A line of tramway, the first laid in England, affords every facility of street communication. Hamilton Square, which occupies the summit of the rising ground near the river, forms the basis or starting point for all the parallel and rectangular lines of streets. The houses of the square are four stories in height, with stone fronts, the centres and ends of each terrace being relieved or ornamented with columns and porticos in the Tuscan order of architecture.

Birkenhead has (exclusive of the out townships) nine churches belonging to the Established Church. St Mary's, built in 1821 by Mr. F. R. Price, late lord of the manor, is in the Decorated Gothic style of architecture, with a well-proportioned tower and spire. The churchyard includes the burial ground and ruins of the ancient priory and chapel of St Mary. In addition to the Established churches there are twenty-four places of worship belonging to various Nonconforming denominations, viz., five Presbyterian, three Independent or Congregational, 2 Baptist, four Wesleyan, one Primitive Methodist, one Society of Friends, two Plymouth Brethren, three Roman Catholic, one Catholic and Apostolic, two Unitarian. Many of these buildings are fair examples of Gothic and classic architecture. St Aidan's Theological College, in connection with the Established Church, occupies a fine and elevated site adjoining the western boundary of Cloughton. It is a handsome building in the Tudor style of architecture. There are seven public elementary schools in connection with the Established churches, and seven in connection with other religious bodies. There is also a first-class proprietary school, conducted on the model of the great public schools, besides several private academies.

There are several public buildings in Birkenhead worthy of notice. The market-hall is a large and commodious building, 430 feet long and 130 feet wide, with substantial and lofty vaults extending under its entire area. It was opened in 1845, and built at a cost of £35,000. The public slaughter-houses in Jackson Street, belonging to the Birkenhead Commissioners, form an extensive pile of buildings; they were erected in 1846 at a cost, exclusive of the site, of about £11,000, and were the first public slaughter-houses of any extent erected in England. The town water-works also belong to the Birkenhead Commissioners, and consist of two pumping stations, the wells of which yield an aggregate supply of about 2½ million gallons in twenty-four hours. The town-hall in Hamilton Street is a one-story building, and formed when first erected the front of the old market-hall; it contains a police court, fire-engine station, and chief bridewell; there are, besides, two branch bridewells. Among other buildings are the post-office in Conway Street, the borough hospital, and the School of Art, also in Conway Street, both erected by the late Mr John Laird, M.P., and a free library in Hamilton Street. The large and commodious industrial schools in Corporation Road were built at the cost of Sir Wm. Jackson, Bart., as a memorial to the late Prince Consort. The Music Hall and the Queen's Hall are situated in Cloughton Road. There is also a neat and commodious theatre and opera-house in Argyle Street.

Birkenhead Park, opened in 1847, occupies 190½ acres of ground, and was laid out at a cost (including the land) of

£140,000. Birkenhead Cemetery, on Flaybrick Hill, occupies 20½ acres of ground, and cost about £40,000.

Woodside Ferry may be regarded as the principal entrance to Birkenhead and Wirral from Liverpool; and its exclusive right of ferryage dates back to 1332. In 1842 the Birkenhead Commissioners purchased this ferry, under an Act of Parliament, from Mr F. R. Price, the lord of the manor. At the present time the annual receipts for passengers alone amount to £36,000, and the number of persons conveyed in the twelve months is upwards of nine millions, the single fare being one penny. A large landing-stage, 800 feet in length and 80 feet in width, is moored at this ferry, the passenger traffic being conducted to and from the stage by means of a double gangway bridge, covered by two circular glass and iron roofs. The goods traffic is conveyed to and from the stage by a well-constructed floating bridge, 670 feet in length and 30 feet in width, which enables the traffic to be carried on at any state of the tide. Handsome and commodious saloon steamers, built and designed upon an improved principle, and capable of carrying above 1700 passengers each, are now used upon this ferry. The late Mr William Laird, whose name is so well known in connection with iron shipbuilding, first conceived the idea of turning to advantage the capabilities of Wallasey Pool for the formation of a dock. After a lapse of many years, the Commissioners of Birkenhead, alive to the advantages which this project would confer upon the town, employed the late Mr Rendel as their engineer, and applied to Parliament for powers to construct the necessary works. The foundation-stone of the new docks was laid in October 1844, and the first dock was opened by the late Lord Morpeth on 5th April 1847. Subsequently, the dock powers of the Commissioners were entrusted to a corporate body of trustees who afterwards transferred the property to the corporation of Liverpool; and ultimately it was vested in the Mersey Docks and Harbour Board, a corporation created by the Act of 1857 for the management of the docks on both sides of the Mersey. At that time the area of the dock space open and in use in Birkenhead was about 7 acres.

The docks bound the town on the north and north-east and partly on the east, extending from the landing-stage at Woodside Ferry to the Wallasey Bridge, a distance of over two miles. The Great Float has been constructed on the site of the Wallasey Pool, forming an immense dock of 150 acres, with a quay space of about five miles. The Great Float separates Birkenhead from Poulton-cum-Seacombe, in the parish of Wallasey, and communicates on the east with a low water basin of about 14 acres (now being converted into a dock) and the Alfred Dock (about 8 acres, and quay space 460 lineal yards), and on the south-east with the Egerton, Morpeth, and Morpeth Branch Docks. The Morpeth Dock (about 11 acres, quay space 1299 lineal yards) is connected with the Morpeth Branch Dock (about 3½ acres, quay space 600 lineal yards), both set apart for steamers. The total water area of these docks is about 170 acres, and the lineal quay space about 10 miles.

The entrances to the Birkenhead Docks are capable of docking the largest class of steamers afloat. The massive iron bridges across the dock entrances are opened and closed by hydraulic power, which is likewise applied to the cranes, coal hoists, warehouse lifts, and other appliances about the docks. At the extreme western end of the West Float are three large graving docks, two about 750 feet in length, and 130 feet and 80 feet in width respectively, and the largest, now in course of construction, measuring about 900 feet in length and 130 feet in width.

Substantial and commodious sheds and warehouses have been erected at various places along the dock quays for the full development of the traffic.

The block of warehouses known by the name of the corn warehouses are immense piles of buildings, with a canal between to give access to the separate blocks of buildings, and with machinery for carrying the grain, &c., from floor to floor, and for despatching it by railway.

In 1847 the Birkenhead Dock Warehousing Company opened their first warehouses, capable of storing 80,000 tons of goods. Each block is detached, and the whole premises are surrounded by a wall 12 feet high. A railway branch, called the Dock Extension Railway, is carried round the property. The company also built blocks of houses for their workmen, known as the Dock Cottages. This property is now in the hands of the Mersey Docks and Harbour Board.

The commerce of Birkenhead is in all respects a branch of that of Liverpool, and chiefly devoted to coal, guano, and grain,—the quantity of coal alone exported being over one million tons per annum. Many manufactories have sprung up within the last few years on the margin of the Great Float and other parts of the town, such as iron foundries, boiler-works, oilcake and seed mills, &c., some of the engineering works, shipbuilding yards, and forges being on a large scale. The Birkenhead Iron-works of Messrs Laird Brothers employ from 3000 to 4000 men; these works, in connection with their shipbuilding yards, have turned out some of the largest iron-clad ships; the engine-works, also belonging to the same firm, are on a very extensive scale. The Canada Works, belonging to Messrs Thomas Brassey and Co., carry on an extensive business in marine engines, iron-bridge building, pontoon and general railway work. There are also the Britannia Works (Messrs James Taylor and Co.) for portable engines, marine engines, traction engines, steam cranes, &c.; Messrs Clay and Inman's Forge, for heavy shafting, &c.; the Wirral Foundry, for large engine castings, &c.; and the Starbuck Car and Waggon Co.'s Works, for building tramway cars, &c.; and Messrs Clover and Clayton's shipbuilding premises as well as other manufactories of less extent.

The affairs of the township of Birkenhead and Cloughton-cum-Grange are managed by twenty-one Commissioners, chosen by the ratepayers. The town contains a head post-office, county court, police court, petty sessional court for the hundred of Wirral, and two banks. Two newspapers are published weekly. The principal market-day is Saturday, but a large hay, straw, and vegetable market is held on Tuesdays in the hay market, a large open space of ground, having an area of about 1½ acres. The total area of the Commissioners' district is 1684 acres, including 365 acres of water space, viz., Birkenhead, 1248 acres, and Cloughton-cum-Grange, 436. The parliamentary borough of Birkenhead was constituted in 1861, and returns one member to parliament. Its parliamentary limits include the extra-parochial chapelry of Birkenhead, the several "townships of Cloughton, Tranmere, and Oxtan, and so much of the township of Higher Bebington as lies to the eastward of the road leading from Higher Tranmere to Lower Bebington." The population of this district in 1861 was 51,649, and in 1871 it had increased to 64,671.

BIRMINGHAM, the fourth town in size and population in England, and the fifth in the United Kingdom, is situated at the extreme north-west of the county of Warwick, in 52° 59' N. lat. and 1° 18' W. long. It is 102 miles in a straight line N.W. of London, from which it is distant 112 miles by the North-Western Railway. The Roman Road, known as the Ikenield Street, runs through the town. On the north Birmingham touches Staffordshire, and on the south and west Worcestershire, the suburbs of the town extending largely into both these counties—Harborne and Handsworth being in the former and Balsall,

Moseley, and Yardley in the latter. The borough itself, however—both parliamentary and municipal, the boundaries being identical—is wholly in the county of Warwick. It covers an area of 8420 acres (of which 5900 are built upon), and includes the whole of the parishes of Birmingham and Edgbaston, and about one-third of the parish of Aston. It is nearly 6 miles long, has an average breadth of 3 miles, is 21 miles in circumference, and has 190 miles of streets and roads. The population, at the census of 1871, was 313,000; and in June 1875 it was estimated by the registrar-general at 360,000. Birmingham was enfranchised by the Reform Act of 1832, when two representatives were assigned to it—and Mr Thomas Attwood and Mr Joshua Scholefield (leaders of the Political Union) were elected; by the Reform Act of 1867 this number was

raised to three. A grant of incorporation was made to the town in 1838, when the first municipal council was elected. In 1870 a School Board of fifteen members was elected, under the Elementary Education Act passed in that year.

The town is built upon the New Red Sandstone, on a boldly undulated site, varying from 200 to 600 feet above the sea-level, steadily rising towards the north and west, so that when looked at from the heights on the south-east side it presents the appearance of a vast semicircle, picturesquely disposed, the masses of houses being broken by spires and lofty chimneys, and the south and west sides being thickly wooded on the slopes. The plan of the town is irregular, and the streets are mostly winding, and many of them somewhat narrow. In the centre, however, is a large open space, known as the Bull Ring and High

Sketch-Plan of Birmingham.

Street, at the foot of which stands the mother church of St Martin, and in which is situated the Market-Hall, one of the largest buildings of its kind in the kingdom. From this centre access is obtained to the principal streets, New Street and High Street; the former, about a quarter of a mile in length, derives a most picturesque appearance from its slightly curved form, and from the effective manner in which the sky-line is broken by lofty buildings alternating with others of lower altitude. This street contains the Exchange, the Grammar School, the Theatre Royal, the rooms of the Royal Society of Artists, which have a fine Corinthian portico stretching across the pavement. At the upper end of the street is the Town-Hall, and close to this are the corporate buildings and the Post-Office. The last quarter of a century has seen a great advancement in the style and accommodation of the public and commercial edifices; streets have been widened and new roads opened,

and the place has altogether put on a livelier and wealthier look. Excepting in some of the older and poorer districts, the private houses have undergone a corresponding improvement. The richer classes live chiefly in the parish of Edgbaston, which belongs almost entirely to Lord Calthorpe, and in which strict rules as to the description, position, and area of the houses are enforced. The streets inhabited by the working classes are, of course, more crowded, and many of the houses are built in enclosed courts, access to which is gained from the street, either by openings between the houses, or by narrow entries, too commonly built over, and thus impeding the free passage of air. Many of the courts, however, are wide enough to allow of small gardens in front of the houses, while in the suburbs almost every house is provided with a garden of some kind, and in a considerable number of cases the houses, through means of building societies, have become

the property of the workmen themselves. The habit exists among all classes of each family (with rare exceptions) occupying a separate house, a practice which greatly affects the area of the town. Thus, to a population of 369,000 there are about 76,000 inhabited houses, giving an average of five persons to a house. Birmingham is a town of rapid growth. In 1700 the population was about 15,000. A century later, at the census of 1801, it had increased to 73,000. In the next thirty years the population doubled, being 147,000 in 1831. The same process was repeated in the following term of thirty years, the population in 1861 being 296,000. Between 1861 and 1871 the increase was 47,000, and the returns of the registrar-general show that the same rate of progress is still going on. It is, however, likely to be checked by the increasing value of land within the borough, by the absorption of available sites for building, and by the consequent overflow of population into the suburbs. If these, inhabited solely by borough people, are taken into account, the real population at present is probably not far short of half a million.

**Government.**—The government of the town resided originally in the high and low bailiffs, both officers chosen at the court of the lord of the manor, and acting as his deputies. The system was a loose one, but by degrees it became somewhat organized, and Crown writs were addressed to the bailiffs. In 1832, when the town was enfranchised, they were made the returning officers. About the beginning of the century, however, a more regular system was instituted, by an Act creating a body of street Commissioners, who acted for the parish of Birmingham,—the hamlets outside its boundaries having similar boards of their own. The annoyance and difficulty caused by these bodies—thirteen in number—led to a demand for the incorporation of Birmingham as a borough; and a charter was accordingly granted by the Crown in 1838, vesting the general government in a mayor, sixteen aldermen, and forty-seven councillors. The powers of this body were, however, unusually restricted, the other local governing bodies remaining in existence. It was not until 1851 that an Act of Parliament was obtained, abolishing all governing authorities excepting the Town Council, and transferring all powers to this body. Under this Act, and another local Act obtained in 1862, the affairs of the town are now administered, the whole municipal government being in the hands of the Town Council. The importance of the duties discharged by the Council may be inferred from the fact that it has under its control nearly 200 miles of street and road, that it has a police force of nearly 500 men, and that its revenue, derived from tolls and rates, amounts to about £300,000 a year. These responsibilities have been increased by the purchase in 1875 of the gas and water-works (the latter with a daily supply of 17,000,000 gallons), the two purchases making a cost of more than £3,000,000. The growth of the revenue and expenditure of the town, its rateable value, and its ordinary debt, excluding the gas and water-works, will be seen from the following tabular statement:—

| Year | Amount of Assessment to the Borough Rate | Total Amount of Rate in the £ | Income  | Expenditure | Balance of Public Debt |
|------|------------------------------------------|-------------------------------|---------|-------------|------------------------|
|      | £                                        | s d                           | £       | £           | £                      |
| 1854 | 645,349                                  | 3 5                           | 120,237 | 131,723     | 366,095                |
| 1859 | 824,869                                  | 3 4                           | 157,121 | 136,987     | 467,002                |
| 1864 | 920,191                                  | 3 8                           | 187,620 | 185,537     | 638,303                |
| 1869 | 1,052,796                                | 3 2                           | 195,155 | 199,950     | 588,449                |
| 1874 | 1,264,911                                | 3 16 <sup>1</sup>             | 289,655 | 271,807     | 664,959                |

*N.B.* The amount of property possessed by the Corporation on 31st December 1874, taken at its original cost, was £1,259,047.

Including rate for School Board, 3d. in the £

The administration of the poor law is vested in a Board of Guardians, of sixty members, for the parish of Birmingham. The parish of Edgbaston (wholly within the borough) is in the poor-law union of King's Norton, and that part of the parish of Aston included in the borough is in the Aston Union. There are three workhouses—that for Birmingham parish, situated at Birmingham Heath, is capable of receiving over 2000 inmates. In the week ending June 19, 1875, there were chargeable to the parish (including lunatics and persons receiving outdoor relief) 6949 paupers, a very small number in proportion to population.

Arms of Birmingham

Birmingham has a grant of quarter sessions, with a recorder, and petty sessions are held daily at the Sessions Court, in Moor Street, before a stipendiary magistrate, and a bench of borough justices. The justices for the borough and Aston division of Warwickshire also sit here occasionally. The borough justices have charge of the administration of the gaol. The town is the head of a county court district, and is the seat of the probate registry for Warwickshire.

**Religious Denominations, Buildings, &c.**—Until the year 1821 Birmingham was in the diocese of Lichfield and Coventry; it is now in the diocese of Worcester and archdeaconry of Coventry, and is a rural deanery. There was formerly a religious house, the priory of St Thomas the Apostle, and a Guild of the Holy Cross, an association partly religious and partly charitable, having a chantry in the parish church. The possessions of the priory went to the Crown at the dissolution, and the building was destroyed before the close of the 16th century. The lands of the Guild of the Holy Cross were granted by Edward VI. to trustees for the support of a free grammar school; they are now of the value of nearly £15,000 a year. Until 1715 there was but one parish church, St Martin's, a rectory, having the tithes of the entire parish of Birmingham. St Martin's was erected about the middle of the 13th century; but in the course of ages was so disfigured, internally and externally, as to present no traces except in the tower and spire of its former character. In 1853 the tower was found to be in a dangerous condition, and together with the spire was rebuilt. In 1873 the remaining part of the old church was removed without disturbing the monuments, and a new and larger edifice was erected in its place, at a cost of nearly £30,000. The new church constitutes the chief ecclesiastical edifice in Birmingham, and indeed the handsomest structure in the town. St Philip's, a stately Italian structure, designed by Archer, a pupil of Wren, was the next church erected. It was consecrated in 1715. Then followed St Bartholomew's in 1749, St Mary's in 1774, St Paul's in 1779, St James's, Ashted, in 1791, and others, which need not be mentioned, followed in due course. At present the mother parish is divided into five rectories, and there are within the borough, including those mentioned, 42 churches (each having an ecclesiastical district assigned to it) of the Church of England, most of these having schools and missions attached to them.

Under the Commonwealth Birmingham was a stronghold of Puritanism. Clarendon speaks of it and the neighbourhood as "the most eminently corrupted of any in England." Baxter, on the other hand, commending the garrison of Coventry, says it contained "the most religious men of the parts round about, especially from Birmingham." The traditional reputation for Nonconformity is maintained by the town, all varieties of dissenters being numerous and influential.

The Unitarians, the oldest body established here, have six chapels. One of these, the Old Meeting, is historically interesting, the congregation having been formed on the Presbyterian model by a number of ministers ejected under the Act of Uniformity. Another chapel, the New Meeting, in Moor Street (now occupied by the Roman Catholics), is memorable as having been the place of Dr Priestley's ministerial labours. In 1862 the Unitarians removed from this place to a new Gothic edifice, called the Church of the Messiah, in Broad Street, where they still preserve a monument of Priestley, with a medallion portrait in profile, and an inscription written by Priestley's friend, Dr Parr. The Society of Friends, whose first meeting house dates from about 1690, have now three places of meeting. The Independents have now eleven chapels, several of them large and flourishing. The Baptists first erected a chapel in Cannon Street in 1738. They have now 16; one of them, Wychley Chapel, Bristol Road, is a singularly handsome structure of 18th century Gothic. The Wesleyan Methodists were established in Birmingham by John Wesley himself in 1745, when he was roughly handled while preaching on Gosta Green. For some years the

worshipped in temporary premises. They have now 17 places of worship; and the other divisions of the Methodist body have 24 in the aggregate. The *Presbyterians* possess 5 places of worship, and the *Jews* have a handsome synagogue. The *Roman Catholics* have paid special attention to Birmingham. From the Revolution of 1688 until 1789 they had no place of worship here. They now have a bishop (who assumes a title from the town), a cathedral, and 9 other churches or chapels, a cemetery, and other establishments in the suburbs, including several religious houses, including the Oratory, founded by Dr Newman. The principal edifice is the cathedral of St Chad, built from the designs of Mr Pugin, at a cost of more than £30,000.

The religious institutions and societies in Birmingham are very numerous, and with these are associated many establishments of a benevolent character, such as almshouses, asylums, refuges, societies for the aid of discharged prisoners, and for the promotion of religious education in Board schools, training institutions for nurses and servants, and others of various kinds, in the management of which persons of different religious opinions are commonly found working together in friendly association.

**Charities.**—These are numerous. The principal is the General Hospital, Sumner Lane, opened in 1779; it was founded by Dr Ash, an eminent local physician. The yearly average of in-patients is about 2300, of out-patients, 25,000. The Queen's Hospital, Bath Row, the other large hospital of the town, was founded in 1840 by Mr W. Sands Cox, F.R.S., an eminent local surgeon, who also founded the Queen's College as a medical school. This hospital receives annually about 1300 in-patients and 17,000 out-patients. The General Dispensary, the officers of which visit patients at their own homes, relieves about 8000 yearly. The Children's Hospital (free), established in 1864 by Dr Heslop, relieves about 15,000 out and 1000 in-patients. It has two establishments—for out patients (a very handsome Gothic building) in Steelhouse Lane, and an important department in Broad Street. There is also a Women's Hospital (free) for the special diseases of women; a lying-in charity; special hospitals for diseases of the eye, the ear, bodily deformities, and the teeth; and a homœopathic hospital. The parish of Birmingham maintains a large infirmary at the workhouse (Birmingham Heath), and a dispensary for out-patients in Paradise Street.

Nearly all these medical charities depend upon subscriptions, donations, legacies, and income from invested property; and the sum raised in this way is probably nearly £30,000 a year. There are two public organizations for aiding the charities, both of which were begun in Birmingham. One is a simultaneous collection in October in churches and chapels, called the Hospital Sunday, established in 1859, and now yielding over £5000 a year; the other is the Saturday Hospital collection, made by the work-people in March, which was established in 1873, and yields about £4000.

There is also a Sanatorium at Blackwell, near the Lickey Hill, about 10 miles distant, common to all the hospitals. Amongst the non-medical charities the principal are the Blind Institution and the Deaf and Dumb Asylum, both at Edgbaston; and Sir Josiah Mason's Orphanage at Erdington, which receives 300 orphan children, and was built and endowed at the cost of about £250,000 solely by Sir Josiah Mason, a Birmingham penmaker. There are also in the town numerous almshouses for aged persons, the chief of which are Lench's Trust, the James Charities, the Licensed Victuallers' Asylum. Besides the general benefit societies, such as the Oddfellows', Foresters', &c., which are strongly supported in Birmingham, the work-people have numerous clubs of a charitable kind, and there are several important local provident societies of a general character, with many thousand members.

**Education.**—The oldest and principal institution is the Grammar School of King Edward the Sixth, founded in 1552, out of the lands of the Guild of the Holy Cross, then of the annual value of £21, but now yielding about £15,000 a year, with a prospect of large increase. The principal or high school, in New Street, was erected in 1840, in the perpendicular period of the Gothic style, from designs by Sir Charles Barry, at a cost, including land, of £71,000. This school is divided into two departments, classical and English, and educates about 600 boys; while connected with it there are four elementary schools for boys and girls, used chiefly by the lower middle class, the number of pupils being 1500. The classical school has ten exhibitions of £50 each, tenable at Oxford or Cambridge. The next most important foundation is that of the Midland Institute, which includes a general literary department (lectures, museums, and reading-rooms), and an industrial department, with classes in science, languages, mathematics, arithmetic, history, literature, and the laws of health. There are about 600 science students, and about 1600 in

the other departments. The Queen's College, originally a school of medicine, founded in 1828, obtained a royal charter in 1843 as a kind of university, with departments of literature, theology, law, science, and engineering. All these branches have now fallen into disuse, excepting medicine and theology, in the latter the college educates candidates for the ministry of the Church of England. An important foundation is Sir Josiah Mason's Scientific College, for the endowment of which Sir Josiah has conveyed to trustees property valued at nearly £100,000, and a capacious building, estimated to cost probably £40,000, is now in erection in Edmund Street, near the Town-Hall. Among the other educational foundations may be mentioned Spring Hill College, Mosley, for the education of Congregational ministers; four industrial schools, a large reformatory for boys at Salfley, and one for girls at Smethwick. For general education there are many private schools, of a good class, for boys and girls. Elementary education is provided in the Church of England day schools, Roman Catholic schools, and Board schools. A total provision, in all the public elementary schools, is made for 41,791 children; there are (July 1875) 51,334 on the books, with an average attendance for the previous quarter of 37,894. The School Board, though it was elected only in 1870, has, by the provision of new schools, and the exercise of compulsory powers, more than doubled the school attendance. It has already built and opened 9 schools, with accommodation for 8800 children, at a cost, for land and buildings, of about £86,000; and 8 other schools are now in progress, providing accommodation for 7400 children, at an estimated cost of about £103,000—making a total expenditure of nearly £200,000, and provision for a total of about 16,000 children.

**Libraries, &c.**—The principal libraries of the town are the Birmingham Library (belonging to a body of proprietors), founded in 1798 by Dr Priestley, and containing about 40,000 volumes, and the Corporation Free Libraries, in Ratcliff Place, commenced in 1861. These consist of a central reference library and lending library (the former containing 36,000 volumes of carefully chosen books), to which is attached a central reading-room. There are also four lending libraries and news-rooms in other parts of the town, and news-rooms are about to be opened by the Corporation in connection with the Board schools. The total issue of books from the libraries for 1874 was 521,991. Included in the reference library are a special Shakespeare library, containing almost all known editions of the plays and of works illustrating them; a library of nearly 1000 volumes, illustrating the works of Cervantes (presented by Mr W. Bragge of Sheffield); and a large and unique collection of Warwickshire books and antiquities, known as the Staunton collection. An Art Gallery and Industrial Museum is attached to the Free Libraries; and there is at Aston Hall another museum of natural history, &c., belonging to the Corporation. Art instruction is provided by the Royal Society of Artists, which has classes and lectures for students, and which holds two general exhibitions annually; and by the School of Art, which has 900 students, together with affiliated classes in schools, containing nearly 1700 students.

**Miscellaneous Institutions, Parks, &c.**—These include 8 banks, 4 principal clubs—the Union, the Midland, the Arts, and the Conservative—to which a Liberal Club is about to be added. There are 3 morning and 2 evening daily papers—4 of them Liberal and 1 Conservative—and 2 weekly papers. There are 2 theatres, 2 large music-halls, and several smaller ones. Musical festivals for the benefit of the General Hospital are held triennially, and are usually marked by the production of new and important works, and by the engagement of most of the leading

vocalists and instrumental performers. There are 5 parks and pleasure grounds belonging to the Corporation—Aston Park and Hall, 45 acres; Calthorpe Park, about 35 acres; Cannon Hill Park, 65 acres; and Adderley and Highgate Parks, each about 12 acres. Beside these there are numerous pleasure-grounds—the Botanical Gardens, Edgbaston, open to subscribers, and the Lower Grounds, a beautiful series of gardens at Aston, in which important flower shows are periodically held. Sutton Park, about 8 miles distant, and including about 3000 acres, is also much used by the Birmingham people. The Corporation has several sets of baths and wash-houses in various parts of the town. There are several extensive cemeteries.

**Public Buildings.**—Of these the Town-Hall, a nobly-proportioned and impressive edifice, is the principal. It stands at the top of New Street, and on three sides is isolated from all other buildings by broad and handsome streets. The hall, completed in 1850 at a total cost of £52,000, is severely classic, modelled upon a Greek temple. The lower stage consists of a vast plinth or basement, 23 feet high, upon which is reared a façade of peripteral character, with 8 Corinthian columns (36 feet high) at the two principal fronts, and 13 columns on each side. These columns (imitated from those of the temple of Jupiter Stator at Rome) support a bold and enriched cornice, finished at each end with a lofty pediment and entablature. The exterior of the hall is built of Anglesea marble. The interior consists chiefly of a regularly-built room, designed specially for meetings and concerts, with an orchestra containing one of the finest organs in the kingdom. The seats are arranged for an audience of 2265 persons, but when cleared of benches, as is the case at great political meetings, 5000 persons may find standing room. On one side of the Town-Hall are the buildings of the Midland Institute and the Free Libraries (of Italian design), occupying the whole of Ratcliff Place, with fronts to Paradise Street and Edmund Street. A new Art Gallery is in course of erection, fronting the latter street. At the back of the Town-Hall is the site of the new building of the Mason College (Gothic), and in front of the hall, in Paradise Street, are Christ Church (classic), the Queen's College (Gothic), and the Post-Office. On the side of the hall in Ann Street, opposite to the Midland Institute, are the new Corporate Buildings (Italian), now being erected at a cost of nearly £200,000. These will give accommodation for the Town Council, law courts, public offices, and the mayor of the borough. Lower down New Street is the building of the Royal Society of Artists (classic), with a noble portico; then comes the Exchange (Gothic) in Stephenson Place; and at the bottom of the latter street is the Central Railway station, used by the North-Western, the Midland, and their branch railways, and fronted by the Queen's Hotel. The station is more than a quarter of a mile in length. The roof, a magnificent specimen of engineering, consists of a vast arch of glass and iron, carried on pillars on each side, and measuring 1100 feet in length, 80 feet in height, and 212 feet in width in a single span. The glass in the roof weighs 115 tons, and the iron-work 1400 tons. Below the station, in New Street, is the Grammar School; and in High Street, close at hand, is the Market-Hall, a magnificent classic building, erected in 1833 at a cost of nearly £70,000, with an area of 4380 square yards, and affording room for 600 stalls. Amongst the other public buildings are the Borough Gaol at Winson Green, with 467 cells, arranged on the separate system, near this the Lunatic Asylum, with accommodation for 600 patients; and close at hand the workhouse, which receives about 2000 inmates. The General and Queen's Hospitals are also handsome buildings, the latter especially so, it being remarkable for a very noble out-patient hall. This and the out-patient

hall at the Children's Hospital in Steelhouse Lane (Gothic) are perhaps the finest rooms of their kind in the kingdom.

Birmingham had till very recently only one public monument, the statue of Nelson, by Westmacott, in High Street; but several others have been erected—namely, those of Joseph Sturge, at the Five Ways, and of Thomas Attwood, the founder of the Political Union, in Stephenson Place, both of them by the late Mr Thomas; James Watt, a singularly beautiful work, in Ratcliff Place, by the late Mr Munro; Sir Robert Peel, in New Street, by Mr P. Hollins; the late Prince-Consort, in the Art Gallery, by Mr Foley; Sir Rowland Hill, in the hall of the Post-Office, by Mr Noble; and Dr Priestley, in New Street, by Mr F. J. Williamson. Chantrey's famous statue of James Watt is in a special chapel at Handsworth church.

**Manufactures.**—From an early period Birmingham has been a seat of manufactures in metal. Hutton, the historian of the town, claims for it Saxon or even British antiquity in this respect, but without the shadow of foundation. The first or direct mention of Birmingham trades is to be found in Leland's *Itinerary* (1538). He writes:—"I came through a pretty street as ever I entered into Bermidgham towne. This street, as I remember, is called Diertry (Deritend). In it dwell smiths and cutlers. There be many smithes in the towne that use to make knives and all manner of cutlery tooles, and many lorimers that make bittes, and a great many naylors, so that a great part of the towne is maintained by smithes, who have their iron and sea-cole out of Staffordshire." The cutlers no longer exist, this trade having gone to Sheffield; but the smiths remain, and the heavier cutting tools are still largely made here. The well-ascertained importance of Birmingham as a centre of manufactures began towards the close of the 17th century, one great source of it being the absolute freedom of the town, there being no guilds, companies, or restrictions of any kind; besides which the easy access to cheap coal and iron indirectly helped the development. It is remarkable that two important trades, now located elsewhere, were first established here. Steel was made in Birmingham until 1797, and was then disused for quite 70 years, when an experiment in steel-making (still carried on) was made by a single firm. Cotton-spinning was begun in Birmingham by John Wyatt, and Lewis Paul, and Thomas Warren as early as 1730; but the speculation was abandoned before the end of the century. The great staple of Birmingham is metal-working in all its various forms. The chief variety is the brass-working trade, which employs several hundred masters, and about 10,000 work-people, and consumes probably 50,000 tons of metal annually, which is worked up into an infinity of articles of ornament and utility. Iron-working, though largely carried on, is a much less important trade, works of this kind being chiefly established in the Staffordshire district. Jewellery, gold, silver, and gilt come next to brass. Then follow small arms of all kinds, some of the larger establishments being capable of turning out 2000 stand per week. Buttons, books and eyes, pins, and other articles used for dress, constitute a large class of manufactures. Glass, especially table glass, is a renowned staple of the town. Screws, nails, &c., are made in enormous quantities; indeed, Birmingham has a monopoly of the English screw trade. Steel pens are also a specialty—as much as, probably, 15 tons or more of steel being the weekly consumption of these articles; the largest maker, Sir Josiah Mason, rolls 5 tons weekly for his own consumption, and has about 60 tons of pens constantly in manufacture in various stages. About 20,000,000 pens are made weekly in the town, and are sold at prices ranging from 1½d to 12s. per gross of 12 dozen. The fact that each gross requires 144 pieces of steel to go through

... different processes, renders this cheapness of sale one of the greatest marvels of manufacturing skill and industry. Electro-plating, first established about 1848 by Messrs Elkington and Mason, is one of the leading trades. Amongst other branches of manufacture are wire-drawing, bell founding, metal rolling, railway carriage building (a large and important industry), steel-toy making (including cutting implements and tools of all kinds), die-sinking, papier-mâché making, and a variety of others, for which reference may be made to a volume entitled *Birmingham and the Midland Hardware District*, prepared on the visit of the British Association in 1865, and extending to more than 700 pages. It is impossible, indeed, in smaller compass to give an adequate idea of the variety and extent of Birmingham industry. To quote a modern writer:—

"We cannot move without finding traces of the great hive of metal-makers—the veritable descendants of Tubal-cain. At home or abroad, sleeping or waking, walking or riding, in a carriage or upon a railway or steamboat, we cannot escape reminiscences of Birmingham. She haunts us from the cradle to the grave. She supplies us with the spoon that first brings our infant lips into acquaintance with 'papa,' and she provides the dismal 'furniture' which is affixed to our coffins. In her turn Birmingham lays the whole world under contribution for her materials. For her smiths, and metal workers, and jewellers, wherever nature has deposited stores of useful or precious metals, or has hidden glittering gems, there industrious miners are busily digging. Divers collect for her button makers millions of rare and costly shells. For her, adventurous hunters rifle the buffalo of his wide-spreading horns, and the elephant of his ivory tusks. There is scarcely a product of any country or any climate that she does not gladly receive, and in return stamp with a richer value."

These labours Birmingham performs with the aid of many thousands of willing hands, moved by busy and ingenious brains, and aided by her own great invention, the steam-engine. For by the genius of Watt and the intrepid courage of Boulton, Birmingham may claim the perfection of this discovery as her own. The memory of the great Soho factory is one of the most precious heritages of the town, and the name remains, for though the old factory has long since disappeared, the firm of Boulton and Watt still continue to make steam-engines in the immediate neighbourhood, and James Watt's own private workshop continues just as he left it, with no single article disturbed, carefully preserved in the garret of his house at Heathfield.

The mention of Watt and of Soho recalls the memories of distinguished inventors and others who have been connected with Birmingham. Johnson was a frequent visitor here to his friend Hector, the surgeon, on whose house in the Old Square a tablet (erected by the Shakespeare Club) bears witness to the residence of the great moralist. Then Baskerville, the printer, carried on his work here. The famous Lunar Society, fully described by Mr Smiles in his *Lives of the Engineers*, brought together a brilliant company—Watt, Boulton, Priestley, Josiah Wedgwood, Darwin, Parr, Withering, Edgeworth, Sir Joseph Banks, Herschel, Dr Solander, Fothergill, Roebuck, Galton, Keir, and many others. Murdoch, the inventor of gas, was a Soho man, and first used his invention to light the Soho factory at the peace of Amiens in 1802. Rickman, the revival and historian of Gothic architecture, practised as an architect in Birmingham. Hutton, the antiquary and historian, carried on his bookselling business here. Many of the best engravers were Birmingham men, notably Willmore and Pye, the special translators of Turner's marvellous creations. In the ranks of landscape painters the name of David Cox will ever confer honour upon the town. Attwood, Joseph Parkes, and Bright speak for it in the region of politics and statesmanship. The series of inventors is continued to our own day by the names of Gillott, Elkington, Chance, Mason, and others.

In many respects Birmingham is a peculiar town, and in none more than the hold it has upon the affections of its

people. A "Birmingham man" is usually a man of strong individuality, independence of character, facility of resource, and with an enduring love for "the old town." These traits of character are the result of a variety of circumstances. Birmingham is peculiar in opening a career even to the humblest who are gifted with ingenuity and industry. The great number of trades keeps work fairly constant, the skill required in them sustains wages of artisans at a high level, and the distribution of labour, and its dependence upon direct personal aptitude, afford chances of rising in the social scale which cannot be found in places where manufactures are mainly of one class and are conducted in factories demanding large capital. It is easy in Birmingham for a man to become a small master, and gradually to push his trade until he is able to establish a factory. Many of the largest employers have either been workmen themselves or are the sons of workmen, while of the smaller manufacturers almost all take a direct part in the handicraft work carried on in their places of business.

Wealth is more evenly distributed than in most other places. There are no colossal fortunes in Birmingham, and comparatively few large ones, and of these very few are made by speculative operations. To compensate for these distinctions there is an unusually large comfortable class—people of good though not excessive incomes derived from solid trade, or from savings made by hard personal and associated work. This class, touching the actually wealthy on one side, by easy and almost imperceptible stages touches the actual working-class on the other, and this latter class is constantly rising into the middle rank.

The Birmingham work-people, in their way, are courteous and helpful. This is probably owing to the free and open and common discussion of subjects of political and social interest engaged in without distinction of class. The same principle is adopted educationally—in the Midland Institute, for example—the Act of Parliament which established the Institute providing that the governing council shall always include artisan members. Another noticeable characteristic of the town is the development of means of self-instruction and of self-help. Birmingham was amongst the earliest places to establish a mechanics' institution, the place of which is now more efficiently supplied by the Midland Institute. Birmingham, again, was the birthplace of the freehold land and building societies, by which workmen are enabled, on easy terms, to acquire houses of their own, and in addition to these institutions, which are numerous and flourishing, it has a very large number of sick and friendly societies, savings-clubs, and other organizations of a provident kind,—more in proportion to population than, probably, any other of the large towns in England. Amongst the social characteristics it should be mentioned that there are few serious disputes between masters and workmen, and that strikes are infrequent, and when they do occur are found capable of easy adjustment by friendly negotiation. One point more is worthy of record—the constancy of the town to those who serve it. Many of the leading manufacturers and other citizens are members of the local governing bodies, and these and the parliamentary representatives are rarely changed by their constituents.

*History.*—Owing to its rapid expansion, and the consequent newness of most of the public and other buildings, Birmingham is often supposed to be a modern town. It is really one of the oldest in the country, and was in existence as a community in the Saxon period. Proof of this was given in 1309 by William de Bermingham, then lord of the manor, who showed in a law-suit that his ancestors had a market in the place, and levied tolls, before the Conquest. Some authors have endeavoured to identify the town with the supposed Roman station called *Bremennum*, but this claim has long since been abandoned as fabulous. The origin of the name is untraceable, the spelling of it is traceable in about 100 different forms. Dugdale, the historian of Warwickshire, adopts Brom

wycham, and regards it as of Saxon derivation. Hutton, the historian of Birmingham, has the fanciful etymology of *Broom* (broom), *wych* (a descent), and *ham* (a home), making together, the home on the hill by the heath. As regards the history of the town, we must agree with Hutton that "the way is long, dark, and slippery." In *Domesday Book* it is rated at four miles of land with half a mile of woods, the whole valued at £203. Two hundred years later the family of De Bermingham, the owners of the place, come into sight,—one of them, William, being killed at the battle of Evesham, in 1265, fighting with Simon de Montfort and the barons against Henry the Third. The son of this William afterwards took part in the French war, and was made prisoner; his father's estates, forfeited by treason, were restored to him. Thenceforward we find the family engaged in various local and other offices, but seemingly abstaining from politics. They held the place until 1527, when Edward de Bermingham was deprived of his property by means of John Dudley, duke of Northumberland, who trumped up a pretended charge of riot and robbery against him, and procured Birmingham for himself. On the attainder of Dudley the manor passed to the Crown, and was granted to Thomas Marrow, of Berkswell, from whom by marriage and descent it went to Christopher Masgrave, and finally, as regards the only valuable part—the market tolls—by purchase to the town itself. In the Wars of the Roses it does not seem that Birmingham took any part, but energy revived in the civil war under Charles I., when the town sided actively with the Parliamentarians. In 1642, when Charles was marching from Shrewsbury to relieve Banbury, the Birmingham people seized part of his baggage, including much plate, money, and wine, which they sent to the Parliamentary garrison at Warwick. Before the battle of Edgehill Charles rested for two nights at Aston Hall, near the town, as the guest of Sir Thomas Holte. The Birmingham people resented this by helping the Parliamentarians to cannonade the hall and to levy a fine upon Sir Thomas Holte. They also set to work, and supplied the Parliamentary army with 15,000 sword blades, refusing to make a single blade for the Royalists. These manifestations of hostility were avenged in April 1643, by Prince Rupert, who, with 2000 men and several pieces of artillery, attacked the town, planting his cannon on an eminence near Sparkbrook, still known as Camphill. The townspeople resisted, but were beaten, many persons being killed or wounded. Amongst the former was Lord Denbigh, one of the Royalist officers. Having captured the place, Prince Rupert allowed his troops to plunder it, to burn about eighty houses, and to set their prisoners to ransom. He also levied a fine of £30,000, equal to at least £100,000 of the present value of money. This bitter lesson kept Birmingham quiet during the rest of the civil war, though the sympathies of the people with the Parliamentarians were unabated. In 1665 Birmingham suffered heavy losses by the plague, great numbers of dead being buried in the Pest Field, at Ladywood, then a lonely place far outside the town, but long since thickly covered with buildings. In 1688 the Revolution provoked a temporary outbreak of Protestant feeling. James II. had given timber from the royal forest of Needwood, near Burton, to build a Catholic chapel and convent in a place still called Mass-house Lane. This edifice the mob promptly destroyed when James gave place to William and Mary. Rather more than a century of quiet prosperity ensued, and then occurred the serious and most lamentable outbreak of popular fury known as the Church and King riots of 1791. For some years there had been much political activity in Birmingham, the dissenters, particularly the Unitarians, being desirous of relief from the political and religious disabilities under which they laboured. The leader in these movements was the famous Dr Priestley, who kept up an active controversy with the local clergy and others, and thus drew upon himself and his co-religionists the hatred of the more violent members of the Church and Tory party. The smouldering fire broke out on the occasion of the French Revolution. On the 14th of July a dinner of Birmingham Liberals was held at the Royal Hotel to celebrate the destruction of the Bastille. This was the signal of a popular outbreak. A Church and King mob, encouraged and organized by leaders of better station, but who were too cowardly to show themselves, began an attack upon the Unitarians. Dr Priestley was not present at the dinner, but his house at Fair Hill, Sparkbrook, was one of the first to be sacked and burnt—his library and laboratory, with all his manuscripts, the records of life-long scientific and philosophical inquiries, perishing in the flames. The house and library of Hutton, the historian and antiquary, were also destroyed. The Unitarian chapel was burnt, and several houses belonging to members of the sect were sacked and burnt. The riot continued until a strong body of troops was marched into the town, but before their arrival damage to the amount of more than £60,000 had been done. Some of the rioters perished in the burning buildings, in the cellars of which they drank themselves into stupefaction. Others were tried and imprisoned, and four of the prisoners were hanged. The persecuted Unitarians recovered a small part of their losses from the county; but Dr Priestley himself, owing to the unworthy prejudice against him, was in a great measure forced to remove to the

United States of America, where he spent the rest of his life. A late atonement was made by the town to his memory in 1873, by the erection of a statue in his honour in front of the Town-Hall, and the foundation of a Priestley scholarship at the Midland Institute.

As if ashamed of the excesses of 1791, Birmingham thenceforth became a thoroughly Liberal and, with one or two exceptions, a peaceful town. In the dismal period from 1817 to 1819, when the manufacturing districts were heavily distressed and were disturbed by riots, Birmingham remained quiet. Even when some of the inhabitants were tried and punished for demanding parliamentary representation, and for electing Sir Charles Wolsley as their delegate, there was no demonstration of violence—the wise counsels of the leaders inducing orderly submission to the law. The same prudent course was observed when in the Reform agitation of 1831–32 the Political Union was formed, under the leadership of Thomas Attwood, to promote the passing of the Reform Bill. Almost the whole town, and great part of the surrounding district, joined in this agitation; vast meetings were held on Newhall Hill; there was much talk of marching upon London 100,000 strong; but, owing to the firmness and statesmanship of Mr Attwood and his associates, there was no rioting or any sign of violence. Ultimately the Political Union succeeded in its object, and Birmingham helped to secure for the nation the enfranchisement of the middle classes and other political reforms. One exception to the tranquillity of the town has to be recorded—the occurrence of riots in 1839, during the Chartist agitation. Chartism took a strong hold in Birmingham, and, under the influence of Mr Feargus O'Connor and some of his associates, nightly meetings of a threatening character were held in the Bull Ring. The magistrates resolved to put these down, and having obtained the help of a detachment of the metropolitan police—the town then having no local police force—a meeting was dispersed, and a riot ensued, which resulted in injury to several persons, and required military force to suppress it. This happened on the 4th of July. On the 15th of the same month another meeting took place, and the mob, strongly armed and numbering many thousands, set fire to several houses in the Bull Ring, some of which were burned to the ground, and others were greatly damaged. The military again interfered, and order was restored, several of the ringleaders being afterwards tried and imprisoned for their share in the disturbance. There was another riot in 1867, caused by the ferocious attacks of a lecturer named Murphy upon the Roman Catholics, which led to the sacking of a street chiefly inhabited by Irishmen; but the incident was comparatively trivial, and further disorders were prevented by the prompt action of the authorities.

**BIRON, ARMAND DE GONTAULT**, a baron and marshal of France, and a celebrated general, who signalized himself by his valour and conduct in several sieges and battles in the 16th century. He was made grand master of the artillery in 1569, and commanded at the siege of Rochelle, and in Guienne. He was one of the first who declared for Henry IV.; he brought a part of Normandy under his subjection, and dissuaded him from retiring to England or Rochelle. Biron was killed by a cannon-ball at the siege of Epemay, July 26, 1592. He was a man of considerable literary attainments, and used to carry a pocket-book, in which he noted everything that appeared remarkable. This gave rise to a proverb at court, when a person happened to say anything uncommon, "You have found that in Biron's pocket-book."

**BIRON, CHARLES DE GONTAULT**, son of the above and born in 1562, created duke of Biron and admiral of France by Henry IV., was a man of great intrepidity, but fickle and treacherous. In 1601 he was sent as ambassador to the court of queen Elizabeth to announce his royal master's marriage with Mary of Medici; but being discovered in a treasonable correspondence with Spain, he was beheaded in the Bastille at Paris, July 31, 1602. The extent to which he had carried his treason was not great, and Henry by sparing his life would not have shown undue clemency.

**BIRS NIMRUD**. See **BABYLON**, page 183.

**BISACCIA**, a city of Italy, in the Principato Ulteriore, 60 miles E. of Naples. It is a bishopric in conjunction with St Angelo, and contains 5342 inhabitants. Formerly it was the chief city in a principality belonging to the Pignatelli family, and it is believed to occupy the site of the ancient Romulea, a Samnite town of considerable size, which was captured by the Romans about 297 B.C.

**BISCAY**, or **VIZCAYA**, one of the three Basque provinces of Spain, with the title of Seignory. It is bounded on the N. by the bay to which it gives its name, E. by Guipuzcoa, S. by Alava, and W. by Santander. Its area is 845 square miles, and its population in 1867 was 183,098. The coastline, which extends from Ondarroa to a short distance to the east of Castro, is bold and rugged, and in some places is deeply indented. The only river of any size is the Nervion or Ibaizabal, on which Bilbao is situated; the others, which are numerous, are merely large mountain streams. The surface of the country is for the most part very mountainous, but at the same time is diversified with numerous narrow valleys and small plains. Some of the mountains are almost entirely composed of naked calcareous rock, but most of them are covered to their summits with forests of oaks, chestnuts, or pine trees. Holly and arbutus are also common, and furze and heath abound in the poorer parts. The province produces wheat, maize, barley, rye, flax, grapes, peaches, apples, and other fruits. The farms are generally small, and are for the most part tilled by manual labour. The wild boar, lynx, fox, and other wild animals, are found in the forests; and deer, rabbits, partridges, woodcocks, and other kinds of game are plentiful. Sheep and goats are the principal domestic animals. In minerals Biscay is very rich. Iron of the finest quality is found in almost every part, and forms a main article of export. The best mines are those of Somorostro, near the coast. The amount obtained in 1866 was about 80,000 tons. Lead, zinc, alum, and sulphur, are also present in smaller quantities; and marble, lime, and sandstone are abundant. The manufacture of the iron ore is the chief branch of industry; but porcelain, linens, copper and brass wares, ropes, and leather, are also produced. The fisheries are actively prosecuted along the coast by a hardy race of fishers, who were the first of their craft in Europe to pursue the whale, formerly abundant in the Bay of Biscay. Cod, bream, tunny, and anchovy are the principal fish taken. Bilbao is the capital of the province, with a population of 17,649; the other towns, Portugalete, Miravalles, Durango, and Orozco, are all very small. The principal ports, besides Portugalete, are Plencia, Bermeo, and Hea. After the fall of the Romans this Cantabrian province came successively into the hands of the Suevi, Franks, and Goths, and formed for some time an independent lordship. The legislative authority was exercised by the lord and a junta of popular representatives. The latter regularly assembled every two years, and on any emergency held an extraordinary meeting under an old tree at Guernica. Although incorporated with Spain, the Biscayans still maintain a republican form of administration, nominating their own governors and magistrates, regulating the amount of the taxes, and exercising various other privileges. They are a brave and active people, and their history is largely composed of exploits in defence of their liberties. For their linguistic and ethnographic affinities, see the article **BASQUE PROVINCES**. The name Biscay is not unfrequently employed as geographically equivalent to Basque, in that case including the three provinces of Biscay proper, Guipuzcoa, and Alava.

**BISCAY, BAY OF**, in French the *Golfe de Gascogne*, and the Roman *Sinus Aquitanicus*, an extensive gulf or bay of the Atlantic, enclosed by the northern coast of Spain and the western coast of France. It extends from the island of Ushant, on the coast of Finistère, to Cape Ortegal on the north of Galicia. In the Spanish portion of the bay the water is about 200 fathoms deep, while in the French portion it is only 20 fathoms. Navigation is impeded by strong westerly winds, and by Rennel's Current, which sets in from the west and sweeps along the southern and eastern shores sometimes at a rate of 27 miles

a day. The Loire, Charente, Gironde, and Adour, besides numerous smaller streams from the Spanish mountains, fall into the bay.

**BISCEGLIA**, perhaps the ancient *Natium*, a fortified seaport of Italy, in the province of Terra di Bari, situated on a rocky promontory on the Adriatic, 21 miles W.N.W. of Bari. It is the seat of a bishopric, and has a cathedral, numerous churches and convents, and a theatre. Some ruins still exist of a hospital, founded by Bohemund for pilgrims to the Holy Land. Its harbour is only accessible to small vessels, and it has little trade. Being destitute of springs, it has numerous reservoirs for the collection of rain-water. Population, 21,371.

**BISCHWEILER**, a town of Alsace, 14 miles N. of Strasburg, on the railway from Haguenau. It has manufactures of woollen and linen stuffs, oil, soap, earthenware, &c., and some trade in hops, hemp, leather, and tobacco. Population in 1871, 9220, including that of Hauhoffen, which numbered 689.

**BISCUIT**. See **BAKING**, page 252.

**BISHOP**, the title of an ecclesiastical dignitary set over the presbyters and deacons at a very early period in the Christian church. The word is derived from the Saxon *biscop*, which is a corruption of the Greek word *episcopos*, which signifies an "overlooker" or "overseer," and the churches in which the order of bishops is recognized as distinct from and superior to the order of presbyters are styled "Episcopal churches." The early history of the Episcopal order is obscure, but it would appear that the first bishops were established in the chief cities of Christendom, and each bishop had a certain territorial district placed under his superintendence, whence the city was termed the see (*sedes*) of the bishop, and the district his parish (*παροικία*), and subsequently his diocese (*διοίκησις*). In course of time the districts assigned to the first bishops became too populous, whereupon the clergy of each diocese, as the case might be, appear to have assembled and to have subdivided the diocese, and to have selected a second bishop, and so bishops and dioceses were multiplied, according to the wants of the churches, until it was thought expedient to reserve the right of erecting new bishoprics to provincial councils, and this reservation was made a rule of the church by a decree of the Council of Sardica. Meanwhile the bishops of the new sees had grouped themselves round the bishops of the more ancient sees, who exercised over them a certain spiritual authority as primates, and presided in their councils, and as some of the great cities in which the sees of the first bishops had been established were distinguished by the title of "metropolis," or mother-city, and were in fact the chief cities of civil provinces of the Roman empire, the bishops of those sees came to be distinguished by the title of metropolitan bishops, and exercised a superior authority in the councils of the church in proportion to the greater importance of their respective sees. This superior dignity of the metropolitan bishops over the others was formally recognized at the Council of Nicea as being in accordance with custom. Upon the establishment of Christianity as the religion of the Roman empire a coercive jurisdiction was engrafted on the spiritual superiority of the metropolitan, and the district over which the metropolitan exercised this jurisdiction was termed his province, the earliest ecclesiastical provinces being for the most part continuous with the civil provinces of the empire. From the circumstance that there was no metropolitan city in Western Africa, the term metropolitan was never adopted in the Carthaginian Church, the senior bishop of that church being termed the primate, and having precedence and authority as such over the other bishops.

In the Church of Rome the Pope claims of right the

appointment of all the bishops, but the exercise of this right is modified by concordats with the sovereigns of the respective states. In France, since the concordat between Pope Leo X. and King Francis I., the sovereign has had the exclusive right of nominating the bishops, but the nomination is subject to the Pope's confirmation. In Austria (with the exception of four bishoprics), in Bavaria, in Spain, and in Portugal, the bishops are also nominated by the sovereign. In some countries the bishops are elected by the chapter of the cathedral church, as in Wurtemberg, or by the bishops of the province, as in Ireland. In England, in the United States of America, and in Belgium, the Pope selects one out of a list of candidates submitted to him by the chapter. In all cases the bishop-nominate or the bishop-elect, as the case may be, has to obtain from the Holy See certain letters, entitled provisions, to authorize his consecration, and to recommend him to the protection of the sovereign and to the good offices of his metropolitan.

In the Church of Russia, after its separation from that of Constantinople, the right to elect a bishop was for some centuries vested in a synod of bishops, but by a regulation of the Emperor Peter the Great, the Holy Synod was restricted to recommend two persons to the sovereign for him to select one of them to be bishop. This regulation, however, is not always observed, and the sovereign, if he thinks fit, sets aside the list submitted to him by the Synod, and nominates of his own choice a person whom the Synod is obliged to elect. In Russia a diocese sometimes contains two capital cities, and the bishop has his title from both.

In the Church of the Levant, properly called the Greek Church, which is governed by the four patriarchs of Constantinople, Antioch, Jerusalem, and Alexandria, each patriarch has the right of confirming the election of the bishops within his patriarchate; but the firman or *berat* of the sultan is likewise necessary to give full authority to the bishops after their confirmation.

The bishops of the Church of England are twenty-eight in number, two of them being metropolitans, namely, Canterbury and York, who enjoy the more dignified title of archbishop, and have a special precedence assigned to them by law (see ARCHBISHOP). The twenty-six diocesan bishops, with the exception of the bishop of the Isle of Man, who is designated the bishop of Sodor and Man, are lords of parliament, and take precedence of the barons in the House of Lords, but the junior bishop for the time being is, by statute, disentitled from being summoned to parliament. From this disqualification the bishops of London, Durham, and Winchester are exempt. These three bishops have precedence over one another in the order in which their names are above mentioned, and they precede all the other bishops, the latter taking precedence of one another according to the date of their appointment. The junior bishop who has a seat in parliament acts as chaplain to the House of Lords.

In the Church of England the bishops exercise certain spiritual functions which are held not to be within the competence of the presbyters. They alone can administer the rite of confirmation to baptized persons, and they alone can ordain candidates for the sacred ministry. These functions the bishops exercise in virtue of their order, but they are also empowered by law to exercise a certain jurisdiction over all consecrated places and over all ordained persons. This jurisdiction they exercise for the most part through their consistorial courts, or through commissioners appointed under 3 and 4 Vict. c. 86, called the Church Discipline Act. The bishops also exercise a certain jurisdiction over marriages, inasmuch as they have by the canons of the Church of England a power of dispensing

with the proclamation of banns before marriage. These dispensations are termed marriage licences, and their legal validity is recognized by the Marriage Act, 4 Geo. IV. c. 76. The bishops had formerly jurisdiction over all questions touching the validity of marriages and the status of married persons, but this jurisdiction has been transferred from the consistorial courts of the bishops to a court of the Crown by 20 and 21 Vict. c. 85. They have in a similar manner been relieved of their jurisdiction in testamentary matters, and in matters of defamation and of brawling in churches; and the only jurisdiction which they continue to exercise over the general laity is with regard to their use of the churches and churchyards. The churchwardens, who are representative officers of the parishes, are also executive officers of the bishops in all matters touching the decency and order of the churches and of the churchyards, and they are responsible to the bishops for the due discharge of their duties; but the abolition of church-rates has relieved the churchwardens of the most onerous part of their duties, which was connected with the stewardship of the church funds of their parishes.

The bishops are still authorized by law to dedicate and set apart buildings for the solemnization of divine service, and grounds for the performance of burials, according to the rites and ceremonies of the Church of England, and such buildings and grounds, after they have been duly consecrated according to law, cannot be diverted to any secular purpose except under the authority of an Act of parliament.

The bishops of England have also jurisdiction to examine clerks who may be presented to benefices within their respective dioceses, and they are bound in each case by the 95th canon of 1604 to inquire and inform themselves of the sufficiency of each clerk within twenty-eight days, after which time, if they have not rejected him as insufficiently qualified, they are bound to institute him, or to license him, as the case may be, to the benefice, and thereupon to send their mandate to the archdeacon to induct him into the temporalities of the benefice. Where the bishop himself is patron of a benefice within his own diocese he is empowered to collate a clerk to it,—in other words, to confer it on the clerk without the latter being presented to him. Where the clerk himself is patron of the living, the bishop may institute him on his own petition. See BENEFICE.

The qualifications of a bishop of the Church of England are, that he should be a learned presbyter of at least thirty years of age, born in lawful matrimony, and of good life and behaviour. The mode of his appointment is regulated by 24 Henry VIII. c. 20. Upon the avoidance of a bishopric the Crown is authorized to issue to the dean and chapter of the cathedral church of the see a licence for them to proceed to the election of a bishop, accompanied by a letter missive containing the name of the person whom they are to elect. The dean and chapter are thereupon required, within twelve days, to elect the person so named by the Crown to be the bishop of the vacant see, failing which election the Crown is empowered to name, by letters patent under the Great Seal addressed to the archbishop and metropolitan of the province, such person to be bishop as the Crown shall think able and convenient. Upon the election being reported to the Crown, a mandate issues from the Crown to the archbishop and metropolitan, requesting him and commanding him to confirm the election, and to invest and consecrate the bishop-elect. Thereupon the archbishop issues a commission to his vicar-general to examine formally the process of the election of the bishop, and to supply by his authority all defects in matters of form, and to administer to the bishop-elect the oaths of allegiance, of supremacy, and of canonical obedience.

After this formal confirmation of the bishop's election has taken place, the archbishop, with the assistance of at least two bishops, proceeds to consecrate the bishop-elect. The most important part of the religious ceremony on this occasion consists in the imposition of hands, in other words, in the archbishop and the bishops placing their hands simultaneously upon the head of the bishop-elect kneeling before them, and in the name of the Holy Trinity committing to him his office of bishop; after which the archbishop delivers to him the Holy Bible and addresses to him a short admonition to preach faithfully the Word of God. The bishop is required afterwards, by statute, to do homage to the Crown, upon which he is put into possession of the temporalities of his see. In the case of the avoidance of the archbishopric of either province, the Crown sends a mandate to the archbishop of the other province to confirm and consecrate the archbishop-elect, and the practice is, for the most part, for the archbishop of the other province to send a commission to four or more bishops of the province of the archbishop-elect to confirm his election and to invest and consecrate him.

Doubts having been raised whether a bishop of the Church of England, being a lord of parliament, could resign his seat in the Upper House of parliament, although several precedents to that effect are on record, a statute of the realm (19 and 20 Vict. c. 115), which is confined to the case of the bishops of London and Durham, was passed in 1856, declaring that on the resignation of their sees being accepted by their respective metropolitans, those bishops should cease to sit as lords of parliament, and their sees should be filled up in the manner provided by law in the case of the avoidance of a bishopric. By a subsequent statute (32 and 33 Vict. c. 111), provision has been made for the case of an archbishop or bishop being permanently incapacitated by age or mental infirmity. If the archbishop or bishop is capable of executing an act of resignation, a representation may be made to the Crown, which is empowered to declare the see to be vacant, but if the archbishop or bishop should be incapacitated from intimating his desire to resign his bishopric, the Crown may grant a licence to the dean and chapter of the cathedral church of the diocese to appoint a bishop-coadjutor. This Act was to be in force for two years; it has been continued for three years more by 35 and 36 Vict. c. 40.

A peculiar institution of the Church of England, established by 26 Henry VIII. c. 14, having been long allowed to remain dormant, has been recently revived, under which every archbishop and bishop, being disposed to have a suffragan to assist him, may name two honest and discreet spiritual persons for the Crown to give to one of them the title, name, style, and dignity of a bishop of any one of twenty-six sees enumerated in the statute, as the Crown may think convenient. The Crown, having made choice of one of such persons, is empowered to present him by letters patent under the great seal to the metropolitan, requiring him to consecrate him to the same name, title, style, and dignity of a bishop; and the person so consecrated is thereupon entitled to exercise, under a commission from the bishop who has nominated him, such authority and jurisdiction, within the diocese of such bishop, as shall be given to him by the commission, and no other.

The first colonial bishopric of the Church of England was that of Nova Scotia, founded in 1787, since which time various colonial bishoprics have been established, some of which were constituted by letters patent of the Crown only, whilst others have been confirmed by acts of the imperial or colonial legislatures. With regard to those bishoprics which have been constituted by letters patent of the Crown only, where the bishopric has been established in a Crown colony, the bishop is legally entitled to exercise the jurisdiction conferred upon him by the letters patent; but where the bishopric has been established in a colony possessing at the time an indepen-

dent legislature, the bishop is not entitled to exercise such jurisdiction unless it has been confirmed to him by an imperial or colonial statute. The report of the judicial committee of the Privy Council in the case of the bishop of Natal (Moore's *Privy Council Reports*, N.S., iii. p. 115) is an exposition of the law on this subject. On the other hand, where bishoprics have been constituted by letters patent of the Crown, in pursuance of imperial statutes, as was the case of the East Indian bishoprics, or where bishoprics constituted by letters patent have subsequently been confirmed or recognized by colonial statutes, the bishop's jurisdiction is complete; otherwise his authority is only pastoral or spiritual. The practice adopted by the Crown, since the decision of the judicial committee in the case of the bishop of Natal has revealed the invalidity of the letters patent granted to many colonial bishops, has been to grant licences to the archbishop of Canterbury to consecrate bishops for the colonies without any definite diocese, and without any authority to exercise coercive jurisdiction. The Crown has also revoked the letters patent erecting Gibraltar into a bishop's see, and the last appointed bishop has been consecrated under a licence from the Crown, and is a titular bishop, having only consensual authority in that colony. (T. T.)

BISHOP, SIR HENRY ROWLEY, musical composer, was born in London on the 18th November 1786. He received his artistic training from Francesco Bianchi, at whose instigation, probably, he was employed to write his first work, the ballet of *Tamerlane et Bajazet*, produced at Covent Garden in 1806. This proved successful, and was followed within two years by several others, of which *Caractacus*, a pantomimic ballet, written for Drury Lane, may be named. In 1809 his first opera, *The Circassian's Bride*, was produced at Drury Lane; but by a singular misfortune the theatre was burned down after one performance, and the score of the work perished in the flames. His next work of importance, the opera of *The Maniac*, written for the Lyceum in 1810, established his reputation, and probably secured for him the appointment of composer for Covent Garden theatre. The numerous works—operas, burlettas, cantatas, incidental music to Shakespeare's plays, &c.—which he composed while in this position, are now in great part forgotten. The most successful were—*The Virgin of the Sun* (1812), *The Miller and his Men* (1813), *Guy Mannering* and *The Slave* (1816), *Maid Marian* and *Clari*, introducing the air of "Home, Sweet Home" (1822). His English adaptations, or rather mangled versions, of Mozart's *Don Giovanni* and *Figaro*, and Rossini's *Il Barbiere* and *Guillaume Tell*, were certainly no true service to art. It seems almost incredible that a man of Bishop's undoubted genius should have been so misguided as to suppress the incomparable *Figaro* overture of Mozart in favour of one of his own. In 1824 Bishop was induced by Elliston to transfer his services from Covent Garden to the rival house in Drury Lane, for which he wrote with unusual care the opera of *Aladdin*, intended to compete with Weber's *Oberon*, commissioned by the other house. As was to be expected the result was a failure, and with *Aladdin* Bishop's career as an operatic composer may be said to close. On the formation of the Philharmonic Society (1813) Bishop was appointed one of the directors, and he took his turn as conductor of its concerts during the period when that office was held by different musicians in rotation. In 1841 he was appointed to the "Reid" chair of music in the University of Edinburgh, but he resigned the office in 1843. He was knighted by the queen in 1842, being the first musician who ever received that honour. In 1848 he succeeded Dr Crotch in the chair of music at Oxford. The music for the ode on the occasion of the installation of Lord Derby as chancellor of the university (1853) proved to be his last work. He died on the 30th April 1855 in impoverished circumstances, though few composers ever made more by their labours. Bishop's name will live in connection with his numerous glees, songs, and smaller compositions, rather than with his larger works, which are now seldom or never performed in their entirety. His Shake-

speare songs and glees are familiar favourites with all vocalists, and genius is discernible in not a few of them. His melodies are clear, flowing, appropriate, and often charming, and his harmony is always pure, simple, and sweet. He was a prominent example of both the strength and the weakness of the native English school, in which the name of Purcell alone stands unquestionably higher than his.

**BISHOP-AUCKLAND**, a market-town of England, in the county of Durham, 11 miles south-west of the city of Durham. It is beautifully situated on an eminence near the confluence of the Wear and the Gaunless, its streets are well paved and lighted, and there is a good supply of water. The parish church is 1 mile distant, at Auckland St. Andrews, but there are several churches and chapels in the town. The town-house, which dates from 1863, is a handsome building, with a tower 100 feet in height, and the palace of the bishop of Durham, which stands at the north-east end of the town, is a spacious and splendid though irregular pile. The site of the palace was first chosen by Bishop Anthony Beck, in the time of Edward I. The present building covers about 5 acres, and is surrounded by a park of 800 acres. The principal industrial establishments are cotton-factories and engineering works, and in the neighbourhood of the town are several coal-mines. Population of local board district in 1871, 8736.

**BISHOP-STORTFORD**, a market-town of England, on the eastern border of Herts, 11 miles E.N.E. of Hertford, and 32 miles by railway from London. It is situated on both sides of the River Stort, a tributary of the Lea, and has thus direct water communication with the metropolis. The parish church of St Michael's, a fine building with a spire, dates from the reign of Henry VI., but was partly rebuilt in 1820. A town-house, a corn exchange, a union workhouse, a high school, a collegiate school, and a diocesan training school, are among the chief buildings; and there are also public baths, libraries, and banks. The industrial establishments comprise a brewery, malt-houses, coach-works, lime-kilns, and a foundry, and the trade consists chiefly in grain and malt. Stortford was in existence before the Norman conquest, and its castle, known as Waytemore Castle, was presented by William the Conqueror to Maurice, bishop of London, and his successors. The building was, however, demolished by King John, and only a few ruins remain. Sir H. Chauncey, the historian of Hertfordshire, and Hoole, the translator of Tasso, were both natives of Stortford. Population of the parish in 1871, 6250.

**BISHOP-WEARMOUTH**, a township of Durham in England, now incorporated in the parliamentary borough of Sunderland. See **SUNDERLAND**.

**BISKARA**, or **BISKRA**, a town of Algeria, in the province of Constantine, and the most important military post of the Sahara. It lies on the south side of the Aures Mountains, in a fertile district, watered by the Wadi Biskra. The streets of the town are broad, and its houses are for the most part built of brick, one story high, and with terraced roofs. Among the principal buildings are the fort of St Germain, the caravanserai, the hospital, and the barracks. A large caravan trade between the Sahara and the Tell passes through the town; iron, limestone, and saltpetre are obtained in the neighbourhood, and the surrounding country yields abundance of valuable dates. The chief articles of manufacture are burnous and carpets. An acclimatization garden has been established at Beni-Morra by the French, who first made themselves masters of Biskara in 1844. Population in 1872, 7367.

**BISMUTH**. This metal appears to have been unknown to the older metallurgical writers, it having been first noticed by Agricola, who speaks of it as a form of lead, and describes the method of separating it from its associ-

ated minerals by lixiviation. Mathesius in his *Bergpostilla*, written between 1553–1562, describes it as white like pyrites, and occasionally cubical like marcasite, easily overcome by the fire when melted, and running together with the tin, which thereby is rendered brittle and unsound,—the last remark referring to its occurrence with tin ores in Saxony. It was considered by the miners as a hopeful indication of silver, and even in certain cases is said to have been transformed gradually into that metal, as portions of the ore which had lain for some time exposed were found afterwards to be partly or wholly changed into silver. This remark is interesting, as the same belief seems to have come up again in our own time. The name *Wismuth* is a miner's term, whose origin is completely lost, but Mathesius assigns it a fanciful derivation from *Wisse* = *Wiese*, a meadow, because in the mine it is found covered with flowers or incrustations of various colours, resembling a meadow covered with brilliantly coloured flowers,—an obvious confusion with the minerals known as nickel and cobalt bloom, derived from the oxidation of arsenides of nickel and cobalt, with which native bismuth is commonly associated in Saxony. It is to this association with cobalt and arsenic that must be ascribed the statements that its principal use was to produce a blue colour, and that it gave off a very poisonous furnace smoke. The chief use of the metal at that time seems to have been by pewterers, who added it to their alloy in small proportions for the purpose of rendering their wares hard and sonorous when struck.

The principal minerals containing bismuth are:—1. *Ores*. Native bismuth, essentially the pure metal, having all the properties described below. This, the most important ore, occurs in connection with nickel and cobalt ores at Schneeberg, Saxony, at Wheal Sparrow in Cornwall, similarly associated, and with tin ores in the mines of the St Just district. It is also found in some quantity in Bolivia. 2. Tetradyte, or telluric bismuth, a compound in variable proportions with the isomorphous element tellurium. This contains from 60 to 80 per cent. of bismuth, 15 to 35 per cent. of tellurium, and from 3 to 5 per cent. of sulphur. It occurs usually in association with gold ores; the principal localities are Schemnitz and Retzbanya in Hungary, the gold mining district of Virginia and North Carolina, California, and other western states of America. It was also found at the Merionethshire gold mines as a rarity. 3. Bismuth silver, found at Schapbach in Baden, and near Copapo in Chili. The mineral from the former locality contains 27 of bismuth to 15 of silver, with some lead and sulphur, and a little iron; and that from the latter 60 of silver to 10 of bismuth, the remainder being copper and arsenic. 4. Bismuthine, or bismuth glance, a sulphide of bismuth, of the composition  $\text{Bi}_2\text{S}_3$ , containing 81.6 per cent. bismuth and 18.4 per cent. sulphur, crystallizing in acicular rhombic prisms isomorphous with antimony glance. It occurs with tin ore at Botallack and other mines near St Just in Cornwall, and in the Saxon localities given above. 5. Bismuth ochre, an earthy oxide of bismuth, containing 90 per cent. bismuth and 10 per cent. oxygen, which is derived from the oxidation both of the native metal and of the sulphide. 6. Bismutite, a hydrated carbonate of bismuth, containing 90 per cent. bismuth oxide, 6.56 per cent. carbonic acid, and 3.44 per cent. water, another product of atmospheric action upon native bismuth. It is found principally in Saxony and South Carolina. Besides the above there is also a silicate described, but this is an exceedingly rare mineral, as is also Hypochlorite, a hydrated silicate mixed with phosphate of alumina. Practically the only ore is the native metal, and of late years, from the supply not keeping pace with the demand, the price has risen very considerably. The bismuth of com-

merce usually contains both gold and silver, often in considerable quantity, which circumstance has probably given rise to the story current about its transmutation into these metals.

#### Physical properties.

Bismuth may be readily obtained in crystals by pouring it when melted into a heated iron ladle, and cooling it until a crust is formed on the surface, which must then be pierced by a red-hot iron rod, and the liquid metal poured off. The solidified portion adhering to the ladle is found to be covered with hopper-shaped crystals, which are usually beautifully irised, owing to the formation of a thin film of oxide on the surface, showing the colours of thin plates. This colouring is only obtained when the metal is quite free from arsenic. It may be purified by melting with about 10 per cent. of nitre, and keeping it constantly stirred at a temperature not much above its melting point, whereby the more oxidizable metals are removed, and form a slag at the surface. Another method of purifying it from arsenic is by fusing it with from 3 to 5 per cent. of zinc, covering the surface with charcoal to prevent oxidation of the zinc, which takes off the whole of the arsenic, and is subsequently removed by treatment with hydrochloric acid, the purified bismuth remaining insoluble. When prepared by any of these processes, bismuth is a hard, brittle metal, and the fracture is highly crystalline and white, with a perceptible red tinge by reflected light. The crystalline form is rhombohedral, the angle of the primary rhombohedron being  $87^{\circ}40'$ , or very close to a cube. The specific gravity is 9.83, but when subjected to great pressure the density is reduced to 9.6. The melting point is  $264^{\circ}\text{C}$ . ( $507^{\circ}\text{Fahr.}$ ) (Rudberg), or  $268^{\circ}3$  ( $515^{\circ}$ ) (Riemsdijk). Like water it may be cooled  $6^{\circ}$  or  $7^{\circ}\text{C}$ . below its freezing point; but when solidification sets in the temperature rises to  $480^{\circ}\text{Fahr.}$ , and continues until the mass is completely solidified. Like ice it expands about  $\frac{1}{10}$  of its volume in solidification, a property which is communicated to its alloys, rendering them valuable for taking casts of incised or relief surfaces for reproduction, as printing-blocks by electrotype or other processes. It may be distilled by heating to a higher temperature in hydrogen. Despretz volatilized it by subjecting it to the current from 600 Bunsen elements. The spectrum of the vapour in the voltaic arc shows numerous brilliant green lines, one strong and one fainter line on the red, and a faint line on the orange field (Masson). The coefficient of expansion by heat is .001341, calorific conductivity 61, silver being 1000 (Calvert and Johnson), and specific heat 0.0305 (Kopp). The electric conductivity is 1.19 at  $14^{\circ}\text{C}$ ., silver being 100 at  $0^{\circ}$  (Matthiesen). According to Matteucci the conductivity varies in the crystals according to the direction of the cleavages. It is the most strongly diamagnetic of all metals.

#### Chemical properties.

The atomic weight is 208 (Schneider) or 210 (Dumas). Like phosphorus and arsenic it is both triatomic and pentatomic, the latter state being represented only by a very unstable acid; there are also several diatomic compounds, including  $\text{BiBr}_2$ ,  $\text{BiCl}_2$ , and  $\text{BiI}_2$ . The triatomic compounds are the most numerous and stable. Unlike the elements chemically similar,—phosphorus, tellurium, arsenic, antimony, &c.,—it does not form a gaseous compound with hydrogen. Bismuth does not change in dry air, but in moist air it oxidizes superficially, and by long exposure may be converted into carbonate. When melted at a red heat it oxidizes, and the oxide (whose formula is  $\text{Bi}_2\text{O}_3$ ), by a higher temperature, melts to a glassy substance, in which property it resembles lead, the oxide, like litharge, exerting a very corrosive action upon earthen crucibles, or substances containing silica, at a red heat. At a red-white heat it slowly decomposes water with the production of oxide. The higher oxide  $\text{Bi}_2\text{O}_5$  corresponds to arsenic acid; it is a very unstable compound, and of no practical value. An intermediate oxide is known which is generally regarded as a compound of the other two,  $\text{Bi}_2\text{O}_3$ ,  $\text{Bi}_2\text{O}_5$ . Bismuth unites directly with chlorine, bromine, and iodine, and when fused with sulphur forms a sulphide of the form  $\text{Bi}_2\text{S}_3$ , corresponding to bismuth glance, and isomorphous with the corresponding sulphide of antimony. The same sulphide is produced when sulphuretted hydrogen is passed through a solution containing bismuth.

Bismuth is but slightly acted upon by hydrochloric or sulphuric acids in the cold; but the latter dissolves it more readily when heated. The best solvent is nitric acid, which attacks it readily, producing a nitrate which crystallizes from the concentrated solution in colourless transparent crystals belonging to the triatomic system, whose composition is  $\text{Bi} \cdot 3\text{NO}_3 \cdot 5\frac{1}{2}\text{H}_2\text{O}$ . These crystals are soluble in nitric acid, but, like all neutral salts of the metal, are decomposed by water, with the formation of an insoluble basic nitrate and an acid liquor. These basic salts are very numerous and complex in constitution, the most important one being that represented by the formula  $\text{Bi} \cdot \text{NO}_3 \cdot \text{H}_2\text{O}$ , which is known as pearl-white, *blanc de fard*. This, which is largely used as a medicine, is prepared by adding to a concentrated solution of bismuth dissolved in nitric acid from 40 to 50 times its weight of water, which precipitates a considerable proportion in the form of a white powder; the remainder, which is retained by the acid liquor, may be separated by neutralizing the excess of acid with ammonia, when a rather

more acid salt than the first precipitate is obtained. Under the name of pearl-white the sub-nitrate is used as a cosmetic, but it has the disadvantage of being readily blackened by sulphuretted hydrogen.

Bismuth unites readily with other metals, the alloys being remarkable for their ready fusibility, and by their property of expanding on solidification. An alloy with potassium is obtained by calcining 20 parts of bismuth with 16 parts of cream of tartar in a crucible, and heating the mixture to a very strong red heat. On cooling, a button of metal is found, of a silvery white colour and lamellar fracture, which fuses easily, and remains for a long time in a pasty condition before solidification; it is brittle, can be easily powdered, and is readily decomposed by water. The alloy with sodium is obtained in a similar manner, with a sodic tartrate. With silver, gold, and metals of the platinum group, bismuth forms brittle alloys. With mercury it forms a liquid amalgam; but when equal weights of the two metals are heated together, there is a separation on cooling of octahedral crystals, which may be a solid amalgam. The copper alloy is brittle, and of a pale red colour. The ternary alloys of lead, tin, and bismuth, are the most interesting of these compounds, from their low fusibility, which is much below that of any of the components taken separately. This property was known to Sir Isaac Newton; the alloy named after him, Newton's fusible metal, melts at  $94^{\circ}5\text{C}$ . ( $202^{\circ}\text{Fahr.}$ ); it contains 5 parts of bismuth, 5 of lead, and 3 of tin. Darcey's fusible metal, containing 2 of bismuth, 1 of lead, and 1 of tin, melts at  $83^{\circ}$  ( $199^{\circ}4\text{Fahr.}$ ). Another, with 5 of bismuth, 2 of tin, and 3 of lead, melts at  $91^{\circ}6$  ( $197^{\circ}\text{Fahr.}$ ) Rose's fusible metal, containing 420 parts of bismuth, 236 of lead, and 207 of tin, a composition corresponding to the formula  $\text{Bi} \cdot \text{Sn} \cdot \text{Pb}$ , fuses below  $100^{\circ}$  ( $212^{\circ}$ ), and remains pasty for a considerable range of temperature below that point. The expansion of this alloy by heat proceeds regularly from  $0^{\circ}$  to  $35^{\circ}\text{C}$ ., but by further heating it contracts up to  $55^{\circ}$ , from which point up to  $80^{\circ}$  the rate of expansion is more rapid than at the lower temperatures. Above  $80^{\circ}$  the normal rate is resumed. The fusibility of these alloys is increased by an addition of cadmium. Thus Wood's fusible metal, containing 1 to 2 parts of cadmium, 2 of tin, 2 of lead, and 7 to 8 of bismuth, melts between  $66^{\circ}$  and  $71^{\circ}\text{C}$ . Another, described by Lipowitz, containing 8 parts of lead, 15 of bismuth, 4 of tin, and 3 of cadmium, is silvery white, and has a specific gravity of 9.4. It softens at about  $55^{\circ}$ , and is completely liquid at a little above  $60^{\circ}$ .

Fusible alloys containing bismuth are used to some extent as safety plugs for steam boilers, as an accessory to the safety-valve,—a hole in the boiler being plugged by a disc of the metal, which in the event of the temperature of the water rising through excessive pressure is melted, and the steam passes through the aperture in the same manner as through an opened safety-valve. It is found, however, that this method is not trustworthy, owing to the liquefaction of the more fusible components of the mass, when subjected to continued heating near but below the melting point, leaving a more refractory alloy behind. The alloy known as Britannia metal, consisting chiefly of tin, antimony, and copper, often contains a little bismuth.

In analysis bismuth is usually separated from solution as carbonate by precipitation with carbonate of ammonia, which is then and separated into oxide by calcination at a gentle heat, in which form it is weighed and estimated. The oxide  $\text{Bi}_2\text{O}_3$  contains 89.74 per cent. of bismuth. It is readily precipitated as sulphide by passing sulphuretted hydrogen through an acid solution, but the precipitate cannot be weighed, as it usually contains an excess of sulphur, and cannot be completely freed from water below  $200^{\circ}$ , so that it must be redissolved in nitric acid and precipitated as carbonate as above described. It may be precipitated in the metallic state by zinc, cadmium, copper, iron, or tin. A plate of copper introduced into a boiling solution of a bismuth salt, even when very weak, is readily covered with a coating of the reduced metal of a steel-gray colour.

Bismuth may be employed instead of lead for the assay of gold and silver by cupellation, as the melted oxide is absorbed by bone ash in exactly the same manner as litharge.

The separation of bismuth from solutions in which it is associated with silver, copper, mercury, cadmium, and lead, may be effected by cyanide of potassium, by digesting the solution with an excess of this reagent the cyanides of bismuth and lead remain in the insoluble portion, while those of the other metals are contained in the filtrate. On redissolving, the lead may be precipitated as sulphate, or by hydrochloric acid and alcohol, which renders the chloride of lead insoluble. The bismuth is finally precipitated from the filtrate by sulphuretted hydrogen. From copper it is readily separated by carbonate of ammonia, bismuth being precipitated, and copper remaining in solution. Another method is by heating in a current of chlorine, when chloride of bismuth is volatilized.

The metallurgical processes for the extraction of bismuth are very simple, being mainly comprised in lixiviation out of contact with the air, and subsequent fusion of the lixivated product of the first operation. At Schneeberg, in Saxony, the lixiviation is effected in cast-iron tubes placed transversely over a fire-grate which runs the whole length of the furnace. The tubes are inclined, the higher

Metallurgy.

and being open for charging, and the lower stopped, with the exception of a small hole for the passage of the separated metal, which is received in a cast-iron pot placed in front and heated with charcoal. The charge, about half a cwt. of ore, broken into pieces about half inch cube, occupies about half of the length and rather more than half the area of each tube. When all the tubes are charged the upper ends are stopped by sheet-iron doors, and heat is applied by means of a wood fire upon the grate. The liquid metal soon commences to flow, and is received in the pots in front. If the flow ceases through any obstruction the passage is cleared by an iron rod introduced through the aperture at the lower end. When the operation, which usually lasts about an hour, has terminated, the residues in the tubes are removed and thrown into a water trough placed behind the furnace on the charging side, and a fresh supply of ore is introduced. The bismuth collected in the pots is ladled out and cast into ingots of from 25 to 50 lb weight. In a furnace containing 11 tubes about 20 cwt. of ore may be heated daily with a consumption of 63 cubic feet of wood. In Plattner's modification the furnace is of the reverberatory form, the tubes being placed with their inclined axes in the direction of the flame, an arrangement which allows the use of a smaller fire-grate and a proportionate saving of fuel. At Joachimsthal, ores containing from 10 to 30 per cent. of bismuth are heated in a finely-ground state with scrap-iron, carbonate of soda, and a little lime and fluor-spar in earthen crucibles, which are heated until the mixture is completely fused, when the contents are poured into iron moulds of a sugar-loaf form. The bismuth collects in the point of the mould, and is covered with a cake of speiss, containing all the nickel and cobalt of the ore with about 2 per cent. of bismuth, which is reserved for further treatment; the slag filling the upper part of the mould is thrown away. If the bismuth is sufficiently rich in silver it is cupelled, and the oxide formed is subsequently reduced or revived by fusion with carbon. When argentiferous lead containing bismuth is subjected to cupellation the former metal is oxidized more rapidly than the latter, which accumulates to such an extent that it may often form a notable proportion of the litharge produced towards the end of the process, although not existing in sufficient amount to be appreciable by the ordinary processes of analysis in the original lead. This property has recently been utilized to recover a small quantity of bismuth existing in the silver ores smelted at Freiberg. The last portion of the litharge, and the hearth or test bottom from the silver refining furnace, are heated in quantities of 80 or 100 lb in earthenware pots with hydrochloric acid until complete solution of the bismuth oxide takes place, the proportion of acid and water being regulated to prevent the formation of insoluble salts. When the liquid is clear it is siphoned off to the precipitating tubs, where it is thrown down as an insoluble oxychloride by the addition of a large quantity of water. By redissolving and reprecipitating, a purer material is obtained, which is then dried and reduced by fusion in iron crucibles with carbonate of soda and charcoal. The production of bismuth annually in Saxony is about 22 tons, and in Austria about 17 cwt.

The principal properties and reactions of bismuth and its compounds were described in 1739 by Pott, who gave a summary of the information contained in the earlier writers. Our more exact knowledge of the subject is due to Neumann, Heliot, Geoffroy (1753), John Davy (1812), Lagerhjelm (1815), Stromeyer, and, more recently, Schneider and Nicklès. (H. B.)

**BISON**, a genus of Ruminant Mammals belonging to the family *Bovidae*, and comprising two widely separated species—the European and American Bisons. They are distinguished from other bovine animals by the greater breadth and convexity of their foreheads, superior length of limb, and the longer spinal processes of the dorsal vertebrae, which, with the powerful muscles attached for the support of the massive head, form a protuberance or hump on the shoulders. The bisons have also fourteen pairs of ribs, while the common ox has only thirteen. The forehead and neck of both species are covered with long, shaggy hair of a dark brown colour; and in winter the whole of the neck, shoulders, and hump are similarly clothed, so as to form a "curly felted mane." This mane in the European species disappears in summer; but in the American Bison it is to a considerable extent persistent. The European Bison (*Bison bonassus*), or Aurochs of the Germans, is the largest of existing European quadrupeds, measuring about 10 feet long, exclusive of the tail, and standing nearly 6 feet high. Formerly it was abundant throughout Europe, as is proved by its fossil remains found on the Continent and in England, associated with those of the extinct mammoth and rhinoceros. These

remains, while indicating larger proportions in the ancient aurochs than in those now living, do not, in Professor Owen's opinion, exhibit any satisfactory specific distinction. Caesar mentions the aurochs as abounding, along with the now extinct *Bos primigenius*, in the forests of Germany and Belgium, where it appears to have been occasionally captured, and afterwards exhibited alive in the Roman amphitheatres. At that period, and long after, it seems to have been common throughout Central Europe, the Caucasus, and the Carpathian Mountains. It is now only found in one of the forests of Lithuania, where it is saved from immediate extinction by the protection of the emperor of Russia, but notwithstanding this it is gradually dying out. Many years ago the Lithuanian bisons numbered over 1000, but by the year 1872 they had diminished to 528, and all attempts to domesticate them have failed. The aurochs feeds on grass and the bark of young trees. The American Bison (*Bison americanus*) has its home on the eastern slopes of the Rocky Mountains, being seldom found to the west of these, and rarely to the east of the Appalachian range. Northwards it extends to lat. 63°, and southward as far as New Mexico. Those bisons or buffaloes, as the settlers call them, roam in enormous herds over the western prairies in quest of fresh pastures, being specially fond of the tender grass that springs up after a prairie fire. The two sexes live in separate herds during the greater part of the year, although one or two aged bulls, it is said, always accompany the females. During the rutting season when the sexes come together, the bulls engage in fierce fights among themselves, and at such seasons it is highly dangerous to approach them. At other times they are shy, and retreat before man; but when wounded they become furious, and then all the dexterity of the practised hunter is needed to make good his retreat. The Indians capture them in various ways; by hunting on horseback, and shooting them with bows and arrows, or with fire-arms, by snaring them within immense enclosures of snow, which the bisons are unable to overleap; or by attracting the herd towards a precipice, and then setting it in motion from behind, so that those in front are pushed irresistibly forward and over. The American Bison, though still found in considerable numbers, is rapidly diminishing before the advance of the white settler; and should man in the meantime not succeed in domesticating it, it will probably ere long share the fate which threatens its European congener. To the Indian the bison has hitherto been indispensable as an article of food, and for the many useful purposes to which its horns, skin, and hair are applied. Its hide forms an excellent fur wrapper; its great value in this respect was proved during the Crimean war.

**BITHYNIA** (*Βιθυνία*), a province in the N.W. of Asia-Minor, adjoining the Propontis, the Thracian Bosphorus, and the Euxine. According to Strabo it was bounded on the east by the River Sangarius, but the more commonly received division extended it as far as the Parthenius, which separated it from Paphlagonia, thus comprising the district on the sea-coast between these two rivers, which was inhabited by the Mariandyni. Towards the west and south-west it was limited by the River Rhyndacus, which separated it from Mysia; and on the south it adjoined the portion of Phrygia called Phrygia Epictetus, and a part of Galatia. The territory thus defined is in great part occupied by mountains and forests, but has valleys and districts near the sea-coast of great fertility. The most important of the mountain ranges is that known as the Mysian Olympus—from its proximity to that province, though properly included within the limits of Bithynia—which rises to a height of about 6400 feet. It towers in a commanding manner above the city of Broussa, while it forms a conspicuous object as seen from Constantinople, at

See  
Plate II.  
vol. xv.

a distance of 70 miles. Its summits are covered with snow for a great part of the year. Eastward of this the range now called Ala-Dagh extends for above 100 miles from the River Sangarius to the confines of Paphlagonia. It adjoins throughout its course the frontiers of Phrygia and Galatia, and rises to a height of from 6000 to 7000 feet. Both of these ranges belong to that border of mountains which bounds the great table-land of Asia Minor through a great part of its extent. The country between them and the sea-coast is for the most part occupied by subordinate mountain chains, which may be regarded as underfalls or offshoots of the more lofty mountain ranges of the interior. These constitute a very rugged and broken country, covered with extensive forests, and traversed by very few lines of route, so that it is still very imperfectly known. But the broad tract which projects towards the west as far as the shores of the Bosphorus, though hilly and covered with forests, so as to be termed by the Turks Aghatch Deniz, or "The Ocean of Trees," is not traversed by anything like a mountain chain.

The western coast of Bithynia, where it adjoins the Propontis or Sea of Marmora, is indented by two deep gulfs or inlets—the northernmost, now called the Gulf of Ismid, anciently known as the Gulf of Astacus, penetrating to a distance of between 40 and 50 miles into the interior, as far as the town of Ismid, the ancient Nicomedia, which is separated by an isthmus of only about 25 miles from the Black Sea. The next, known in ancient times as the Gulf of Cius, now called the Gulf of Mudania or Gemlik, extends to about 25 miles. At its extremity is situated the small town of Gemlik, on the site of the ancient Cius, at the mouth of a valley, through which it communicated with the inland lake of Isnik, on which was situated the flourishing city of Nicæa.

According to the general testimony of ancient authors (Herodotus, Xenophon, Strabo, &c.), the Bithynians were a tribe of Thracian origin who had migrated into Asia by crossing the Bosphorus. The existence of a tribe called Thyni in Thrace is well attested, and the two cognate tribes of the Thyni and Bithyni appear to have settled simultaneously in the adjoining parts of Asia, where they expelled or subdued the previously existing races of the Mysians, Caucones, and other petty tribes, the Mariandyni alone maintaining themselves in the north-eastern part of the country. Herodotus mentions the two tribes, the Thyni and Bithyni, as existing side by side; but ultimately the latter people must have become the more important, so as to give name to the whole country. They were first subdued by Cræsus, and incorporated with the Lydian monarchy, together with which they soon after fell under the dominion of Persia (546 B.C.). During the Persian empire they were included in the satrapy of Phrygia, which comprised all the countries up to the Hellespont and Bosphorus. But even before the conquest by Alexander some obscure native chiefs appear to have asserted their independence in the mountains of Bithynia, and successfully maintained it under two native princes named Bas and Zipætes, the last of whom transmitted his power to his son Nicomedes I., who was the first to assume the title of king. He became the founder of the city of Nicomedia, which soon rose to great prosperity and opulence; and during his long reign (278–250 B.C.), as well as those of his successors, Prusias I., Prusias II., and Nicomedes II. (149–91 B.C.), the kingdom of Bithynia held a considerable place among the minor monarchies of Asia. But the last king, Nicomedes III., was unable to maintain himself against the increasing power of his neighbour Mithridates, king of Pontus; and although restored to his throne by the interposition of the Roman Senate, at his death, in 74 B.C., he bequeathed his kingdom by will to the

Romans. Bithynia was now reduced into the form of a Roman province; but its limits were frequently varied, and it was commonly united for administrative purposes with the neighbouring province of Pontus, extending along the southern shore of the Black Sea as far as Trapezus or Trebizond. This was the state of things in the time of Trajan, when the younger Pliny was appointed governor of the combined provinces (103–105 A.D.), a circumstance to which we are indebted for much valuable information concerning the Roman provincial administration. Under the Byzantine empire Bithynia was again divided into two provinces, separated by the River Sangarius, to the westernmost of which the name of Bithynia was restricted.

The most important cities of Bithynia in ancient times were Nicomedia and Nicæa, which disputed with one another the rank of its capital. Both of these were founded after the time of Alexander the Great, but at a much earlier period the Greeks had established on the coast the colonies of Cius (afterwards named Prusias), on the site of the modern Gemlik; Chalcedon, at the entrance of the Bosphorus, nearly opposite Constantinople, and Heraclea, surnamed Pontica, on the coast of the Euxine, about 120 miles east of the Bosphorus. All these rose to be flourishing and important places of trade. Prusa, at the foot of Mount Olympus, which was founded by Prusias, was also a considerable town under the Roman empire, but did not attain in ancient times to anything like the importance enjoyed by the modern city of Broussa, which became the capital of the Ottoman Turks before the conquest of Constantinople, and is still (after Smyrna) the second city of Asia Minor. The only other places of importance at the present day are Ismid (Nicomedia) and Scutari, which, from its position on the Bosphorus, may be considered as a mere suburb of Constantinople.

The natural resources of Bithynia are still very imperfectly developed. Its mountains are covered with vast forests, which would furnish an almost inexhaustible supply of timber, if rendered accessible by roads. Coal also is known to exist in the neighbourhood of Erekli (Heraclea), but is not worked to any extent. The valleys which open towards the Black Sea abound in fruit trees of all kinds, while the valley of the Sangarius and the plains near Broussa and Isnik (Nicæa) are fertile and well cultivated. Extensive plantations of mulberry trees supply the silk for which Broussa has long been celebrated, and which is manufactured there on a large scale.

The principal rivers of Bithynia are the Sangarius, still called the Sakaria, which traverses the province from S. to N., the Rhyndacus, which forms the boundary that separated it from Mysia; the Dilkeus (Filyas), which rises in the chain of the Ala-Dagh, about 150 miles from the sea, and after flowing by the town of Boli (the ancient Claudiopolis) falls into the Euxine, close to the ruins of the ancient Tium, about 40 miles N.E. of Heraclea. It has a course of more than 100 miles. The Parthenius (now called the Bartan), which forms the boundary of the province towards the E., is a much less considerable stream. (E. H. A.)

BITONTO, a city and bishop's see, in the province of Bari, in South Italy, on the great road from Foggia to Bari, about 12 miles from the latter town. Its cathedral, dedicated to St Valentine, is a fine building in the Italo-Gothic style; and it possesses a theological seminary, a large orphan asylum, and a hospital. The inhabitants maintain an active trade, and have extensive manufactures of olive oil. Their principal export is an excellent wine known as Zagarelle. Bitonto, or Bituntum, seems from its coins to have been a place of some importance at an early period, but it makes no appearance in ancient history. In the Middle Ages its *Accademia degli Infiammati* obtained

considerable fame. In 1735 it was the scene of a severe battle, in which the Austrians were defeated by the Spaniards under Mortemar, in whose honour Philip V. caused a pyramid to be erected on the spot. Population in 1871, 24,978.

**BITSCH** (French, *Bitche*), formerly *KALTENHAUSEN*, a town and fortress in German Lorraine, on the River Horn, at the foot of the northern slope of the Vosges, between Hagenu and Saargemund. It was originally a countship in the possession of the counts of Alsace and Flanders, but was bestowed by Frederick III. on the dukes of Lorraine, and at length passed with that duchy to France in 1738. After that date it rapidly increased, and its citadel, which had been constructed by Vauban on the site of the ducal palace, was restored and strengthened. The attack upon it by the Prussians in 1793 was repulsed, and although the Bavarians occupied the town in 1815 and 1818, they did not get possession of the fort. In the war of 1870 it was blockaded by the Germans in vain, and only surrendered in 1871, after the campaign was over. A large part of the fortification is excavated in the red-sandstone rock, and rendered bomb-proof; while a supply of water is secured to the garrison by the possession of a deep well in the interior. The inhabitants of the town, who in 1871 numbered 3047, manufacture watch-glasses and matches, and carry on a trade in grain, cattle, wood, and peats.

**BITTERN**, a genus of Wading Birds, belonging to the family *Ardeidae*, comprising several species closely allied to the Herons, from which they differ chiefly in their shorter neck, the back of which is covered with down, and the front with long feathers, which can be raised at pleasure. They are solitary birds, frequenting countries possessing extensive swamps and marshy grounds, remaining at rest by day, concealed among the reeds and rushes of their haunts, and seeking their food, which consists of fish, reptiles, insects, and small quadrupeds, in the twilight. The Common Bittern (*Botaurus stellaris*) is nearly as large as the heron, and is widely distributed over the eastern hemisphere. Formerly it was common in Britain, but the extensive drainage of late years has greatly diminished its numbers, and it is now a permanent resident only in the fen districts of England. The bittern in the days of falconry was strictly preserved, and afforded excellent sport. It sits crouching on the ground during the day, with its bill pointing in the air, a position from which it is not easily roused, and even when it takes wing, its flight is neither swift nor long sustained. When wounded it requires to be approached with caution, as it will then attack either man or dog with its long sharp bill and its acute claws. It builds a rude nest among the reeds and flags, out of the materials which surround it, and the female lays four or five eggs of a uniform dusky brown. During the breeding season it utters a booming noise, from which it probably derives its generic name, *Botaurus*, and which has made it in many places an object of superstitious dread. Its plumage for the most part is of a pale buff colour, rayed and speckled with black and reddish brown. The American Bittern (*Botaurus lentiginosus*) is somewhat smaller than the European species, and is found throughout the central and southern portions of North America, where it forms an article of food. It also occurs in Britain as an occasional straggler.

**BITTERS**, an aromatized alcoholic beverage, so named originally in the United States, where it was first used on account of its flavour and tonic influence. The drink by itself, or as an addition to unflavoured spirits, is used with considerable frequency in Europe, and especially in France it has come to be favourably regarded as a substitute for the insidious and deleterious absinthe. In the

year 1867 the daily consumption of bitters in Paris alone had reached 4000 litres. The preparation of bitters in Europe was at first a *specialité* of the Dutch, and Dutch bitters are the staple used in Great Britain. A considerable variety of recipes are in use for the preparation of Dutch bitters, but generally gentian root is the leading bitter ingredient in the beverages. The following is given as the composition of brandy bitters:—Gentian root, 4 oz.; orange peel, 5 oz.; cassia bark, 2 oz.; cardamoms, 1 oz.; and proof spirits, 1 gallon, coloured with  $\frac{1}{4}$  oz. of cochineal. Bitters prepared in the great French cities—Bordeaux, Rouen, Havre, Paris, &c.—contain extracts of gentian root, bitter orange peel, and orange flowers, with a proportion of sugar, and possess an alcoholic strength of about 40°.

**BITUMEN**. See *ASPHALT*, vol. ii. p. 715.

**BIZERTA**, or *BENZERT*, a seaport of North Africa, in Tunis, 38 miles from the capital, on a gulf or salt lake of the same name, which communicates with a shallow fresh water lake in the interior, formerly called *Sisara*, and now the lake of *Gebel Ishkel*. It occupies the site of the ancient Tyrian colony *Hippo Zaritus*, the harbour of which, by means of a spacious pier, protecting it from the north-east wind, was rendered one of the safest and finest on this coast. This important work, however, having been neglected by the Turks, the port has been to a great extent choked up. It is still visited by small vessels, and a certain amount of trade is carried on. The exports in 1869 were valued at £19,759. The town is about a mile in circuit; it is defended by several forts. The principal employment of the inhabitants is fishing. The adjoining lake abounds in fish, particularly mullets, the roes of which, dried and formed into the substance called *botargo*, form a considerable article of Mediterranean commerce. N. lat. 37° 17', E. long. 9° 50'. Population, 8000.

**BLACK**, DR *JOSEPH*, a celebrated chemist, was born, in 1728, at Bordeaux, where his father—a native of Belfast, but of Scottish descent—was engaged in the wine trade. He was educated from his twelfth to his eighteenth year at a grammar school in Belfast, whence he removed, in 1746, to the university of Glasgow. There he chose medicine as his profession, and devoted himself earnestly to physical science, being encouraged and guided by Dr Cullen, who then lectured on chemistry in Glasgow, and whose liberal and original views were in unison with Black's own aspirations. From assisting in Cullen's chemical experiments he acquired the delicate manipulative skill essential to success in original scientific research.

In 1751 he went to complete his medical studies at Edinburgh, and after taking his medical degree there in 1754 revealed himself as a great scientific discoverer. At that time the causticity of the alkalis was attributed to their absorbing an imaginary fire-essence known as *phlogiston*, an hypothesis which Black overthrew by showing that their causticity depended on their combining with a ponderable gas, carbonic acid, which he named *fixed air*, meaning that it was found not only as a separate fluid, but as *fixed* in solid bodies. This discovery, made by Black in his twenty-fourth year, was first sketched in a treatise, *De Acido e Cibus orto, et de Magnesia*, and afterwards embodied in his work, *Experiments on Magnesia, Quicklime, and other Alkaline Substances*, which Lord Brougham has declared to be "incontestably the most beautiful example of strict inductive investigation since the *Optics* of Sir Isaac Newton."

These works revolutionized chemistry. Previous investigators imagined that atmospheric air was the sole permanently aeriform element, a belief to which even Hales, who had shown that solids contain elastic fluids, had adhered. But when Black proved that a gas not identical with atmospheric air was found in alkalis, it was made plain

that various dissimilar gases might exist, and pneumatic chemistry was founded.

Although the full value of this discovery was not immediately visible, it added so greatly to Black's reputation that in 1756 he was chosen to succeed Dr Cullen as lecturer on chemistry in Glasgow University. He was also appointed to the chair of anatomy, but, not finding its duties congenial, exchanged it for the professorship of medicine. For some time he was so assiduous in preparing his lectures as to neglect fresh investigations, and even left the examination of carbonic acid, or *fixed air*, to be afterwards completed by Cavendish. He was highly esteemed as a professor by his students and colleagues, and became, through his attention and urbanity, a very popular physician in Glasgow. From 1759 to 1763 he prosecuted inquiries resulting in his theory of *latent heat*, which may be thus summarized—A solid liquefies or a fluid vaporizes through heat uniting with the solid or fluid body, and a fluid solidifies or a gas liquefies through the loss of heat; but in no case is this increase or diminution of heat detected by the senses or the thermometer. Black therefore named that heat *latent* which alters the condition, not the temperature, of a body. He likewise proved that bodies of equal masses require different increments of heat to raise them to the same sensible temperature—a doctrine now known as the law of *specific heat*.

His theory of latent heat he corroborated by numerous experiments, but he never published a detailed account of it, an omission which enabled others to lay claim to his great discovery. Thus M. Delue, in 1788, declared himself its author. In 1766 Black was elected to succeed Cullen in the chair of chemistry at Edinburgh University. In this office he bestowed great care on his lectures, striving to give a lucid exposition of ascertained facts rather than to effect new discoveries; and such an interest did he communicate to his subject, that chemistry was for a time, it is said, regarded as a fashionable accomplishment in the Scottish capital.

He was intimate with the great men who adorned Edinburgh society during the second half of the eighteenth century, counting among his friends Watt, Hume, Robertson, Hutten, Adam Smith, and, at a later period, Robison, Playfair, and Dugald Stewart. His constitution had always been feeble, and he was ultimately reduced to the condition of a valetudinarian, which may account for the indifference he manifested during his latter years to original research. He retired from his professorship in 1796, and on the 26th November 1799 passed away so quietly that a cup of water, which he had held in his hand, remained unspilled after he had breathed his last. At the instance of Lavoisier he had been elected a member of the Paris Academy of Sciences.

Black was singularly modest, gentle, and sincere; his philosophic tranquillity was seldom ruffled; and his sagacious diffidence was equally conspicuous in his scientific inquiries and in his social relations. He has been called the founder of modern chemistry. When he began his career that branch of knowledge had only recently been raised to the rank of a true science through the efforts of Hermann Boerhaave, and was in many quarters even regarded with suspicion as being akin to alchemy on the one hand, and to humble trades on the other. But after Black's discoveries its scope and capabilities were immensely extended, and no one could then question its claim to rank with the most important sciences. The only works of his which appeared in print during his lifetime were *Experiments on Magnesia, &c.*, *Observations on the more ready Freezing of Water that has been boiled*, and *Analysis of the Waters of some Boiling Springs in Iceland*.

His lectures on chemistry were issued after his death. (*Cf.* Prof. Robison's *Life of Black*.)

BLACK FOREST (German, SCHWARZWALD), an extensive upland district on the right bank of the upper Rhine, stretching from that river to the Neckar and upper Danube. See BADEN and WÜRTTEMBERG.

BLACK SEA, or EUXINE, the *Pontus Euxinus* of the ancients, is a large inland sea, bounded on the W by the Turkish provinces of Rumilia, Bulgaria, and Moldavia, on the N. by South Russia, including Bessarabia, Kherson, and Taurida; on the E. by the Russian provinces of Circassia and Transcaucasia; and on the S. by the Turkish provinces of Asia Minor. It is entered from the Mediterranean through the channel of the Dardanelles or *Hellespontus*, the Sea of Marmora or *Propontis*, and the channel of Constantinople or *Thracian Bosphorus*, and it is connected with the Sea of Azoff, or *Palus Mæotis*, by the strait between the Crimea and the isle of Taman, anciently the *Cimmerian Bosphorus*, and known by the various modern names of the Strait of Kertch, of Yenikale, and of Taman.

The first navigators of Greece who ventured into this sea having been repulsed or massacred by some of the fierce tribes inhabiting its coasts, their countrymen gave it the name of *Pontus Arenos*, or "sea unfriendly to strangers." But when the repeated visits of the Greeks had rendered these tribes more familiar with strangers, and commercial intercourse had softened down the original ferocity of their character, Grecian colonies were established at different points on the shores of this sea, and the epithet *Arenus* was changed into *Euxinus*, which has the opposite import, and means "friendly to strangers." The modern name seems to have been given to it by the Turks, who, being accustomed to the navigation of the *Ægean*, the islands of which furnish numerous harbours of refuge, were appalled by the dangers of a far wider expanse of water without any shelter, subject to sudden and violent storms, and often covered with dense fogs.

The basin of the Black Sea is of an irregular ovate form, its long diameter lying nearly E. and W. Its greatest length, from the head of the Bay of Burghaz in Rumilia on the west to the boundary between Transcaucasia and Asiatic Turkey near Batum on the east, is about 720 miles. Its greatest breadth is in its western portion, between the estuary of the Dnieper on the north and the mouth of the Sakaria on the south, where it is 380 miles; its middle portion is narrowed, by the projection of the Crimean peninsula on the north and of the coast line of Anatolia between Cape Kerempe and Sinope on the south, to 160 miles; but further east it widens out again between the Strait of Kertch on the north and the mouth of the Kizil Irmak (the ancient *Halys*) on the south, to 260 miles. Its total area, including the Sea of Azoff, is about 172,500 square miles. The western coast line of the Black Sea, for some distance northwards from the Bosphorus, is high and rocky, having ranges of hills at its back; and the water rapidly deepens to from 30 to 40 fathoms. Between their northern extremity and the range of the Balkans (the ancient *Hæmus*), which extends east and west, terminating in Cape Eminch, there is a large bay, named after the town of Burghaz at the head of it, which affords a safe anchorage for large ships, the only one on this coast. Between Cape Eminch and Varna the coast line is again low and the shore shallow; and the same condition extends, with but little interruption, along the low-lying region called the Dobrudscha, which extends to the mouth of the Danube. This great river discharges itself by seven mouths, among swampy islands and shifting banks; and the quantity of *detritus* brought down by it is so large as not only to form a very extensive bar, but also to require the con-

tinual use of artificial means for its removal from the bed of the navigable channels. The same low coast-line continues along the southern boundary of the Russian steppes, to the shallow inlet which forms the estuary of the Dniester, and of which the mouth is nearly closed by a bar; beyond which, towards Odessa, the coast-line is more lofty, and the waters deepen more rapidly, so that it has been possible to construct a harbour in which ships of considerable tonnage can lie securely. Between Odessa and the mouth of the Dniester the shore again becomes low, and the water shallow; and the outlet of that river, which also receives the River Bog or Bug, is a long shallow bay bordered by shifting sand-banks, which is called the Gulf of Leman or the Bay of Kherson. Only ships of light draught of water can navigate these rivers, of which the Bug is the deeper; and vessels of war, which are built and repaired at the arsenals of Kherson and Nicolaieff, are artificially floated up and down. The Crimean peninsula is separated from the mainland on the western side by the Gulf of Perekop, the northern boundary of which is formed by a narrow belt of sand that runs nearly straight for a distance of 80 miles, and was celebrated by ancient geographers as the *δρόμος Αχελεύς*. The inner portion of this gulf is so shallow that only vessels of very light draught can make their way to Perekop, which is situated on the narrow isthmus that divides it from the Sea of Azoff. Along the western coast of the Crimea, however, the coast-line gradually rises, and the shore deepens more rapidly; and at Eupatoria there is a good harbour for ships of moderate size. South of Eupatoria, the coast is formed by cliffs, sometimes of considerable height; and the water is deep almost to their base. The harbour of Sebastopol somewhat resembles that of Valetta in being a deep inlet, subdividing into several branches, in any one of which the largest vessels may find good anchorage, and lie within a cable's length of the shore. Between Sebastopol and Cape Chersonese are six other bays running inland parallel to each other; and on rounding this we arrive at the harbour of Balacava, which is a remarkable inlet, having a very narrow entrance, and almost entirely surrounded by lofty heights. Eastward from Balacava there commences an almost continuous chain of lofty cliffs, with mountains behind them, whose height ranges from 4000 to 5800 feet; the commencement of this chain is formed by Cape Aia or Tarchanskoi, probably the *Parthenium* of Strabo, the most remarkable headland in the Crimea. Along the whole south-east coast of the Crimean peninsula the water is deep; but there is no good harbour between Balacava and the Bay of Kaffa, which furnishes an excellent and sheltered anchorage for large vessels, and was formerly much frequented when Kaffa or *Theodosia* (an ancient Greek colony) was a port of considerable importance. The peninsula of Kertch and the island of Taman, which separate the Sea of Azoff from the Black Sea, are for the most part low and sandy, the most elevated land in each being near the border of the Strait of Yenikale. On the western side of this strait the town of Kertch is situated, upon what was formerly known as the Hill of Mithridates.

The Sea of Azoff may be considered as the wide shallow estuary of the River Don, which discharges its waters into the north-eastern prolongation of the sea, sometimes distinguished as the Gulf of Taganrog; its area is estimated at about 14,000 square miles; and its depth, which is nowhere more than 7½ fathoms, diminishes near the shores to 4½ fathoms, and is less than 2 fathoms opposite the town of Taganrog. These depths show a tendency to yet further diminution through the deposit of river *detritus*,—vessels which could formerly pass up the gulf as far as Taganrog being no longer able to do so, whilst during certain winds the bottom becomes dry enough to be crossed between Taganrog and Azoff. The western portion of this basin is separated from the rest by a long narrow strip of low sandy land, enclosing what was named by the Greeks the Putrid Sea,—into which, when the wind is easterly, the water

of the Sea of Azoff passes through a narrow opening at the northern extremity of the bar, but which at other times consists of a series of swamps and quagmires, equally impassable to men and animals, and giving forth noxious exhalations that render the adjacent country nearly uninhabitable. The water of the Sea of Azoff is always less salt than that of the Black Sea; and when the Don is at its fullest, the large quantity of fresh water which is mingled with the water of the sea renders the latter nearly drinkable, and tends to empty the basin of its salt. When, on the other hand, the river brings down but little water, and the wind is from the south, there is a considerable reflux of the more saline water outside; and thus the average salinity of the water of the Sea of Azoff is maintained,—just as is seen to be the case on a larger scale with the Baltic. See *BALTIC*, p. 297.

The whole of the portion of South Russia that lies between the Dnieper and the Don is an almost unbroken *steppe*, but very little elevated above the sea-level; and there are abundant indications of its having been at no remote period covered by salt water. For not only are there numerous salt lakes and marshes at a long distance inland from the present coast-line, but extensive beds of sea-shells, which have become mineralized into strata of solid limestone, sometimes 30 or 40 feet in thickness. The like features prevail over the plain which lies between the Don and the Kuban, and which forms the eastern boundary of the Sea of Azoff; this plain, inhabited by nomade Kalmucks and Cossacks, extends eastward to the desert of Astrakhan; and as salt marshes and beds of sea-shells are found there also, it is evident not only that both the Black Sea and the Caspian extended farther north than they do at present, but that they were then in continuity with each other over the plain of South Russia, though separated towards the south by the Caucasian Highlands. It is interesting to note that Pliny expressly stated that the Tauric Chersonese was not only surrounded by the sea, but that the sea covered all that northern portion of it which is now an alluvial level.

The island or peninsula of Taman, which forms the eastern border of the Strait of Yenikale, is for the most part an expanse of salt-marshes and lagoons, into which the River Kuban discharges itself,—one portion of its water passing into the Sea of Azoff and the rest into the Black Sea. At Anapa, a little to the east, the Caucasian range comes down to the sea; and thence around the shore of Circassia, the coast-line is high with a mountainous back-ground, and the water rapidly deepens. As the great mountain range trends inland, however, the coast becomes lower; and the region now termed Mingrelia, the ancient *Colchis*, is a fertile plain, through which run the River Rion (the ancient *Phasis*) having the important port of Poti at its mouth, and the Khopi, at the mouth of which is Redout Kale. Through these channels the merchants of Tiflis export the produce of the interior, and import European goods. Passing the boundary between Russia and Turkey, the coast-line begins to trend westwards, to the outlet of the large river Chouruk (the ancient *Batys*), where the fortified town of Batoum is situated at the base of the northern mountain range of Asia Minor. This range extends, with occasional interruptions, along the whole southern coast of the Black Sea, sending down spurs that form headlands and promontories, sometimes of considerable height. Owing to the steepness of the shores, there are few good anchorages here, except in the Bay of Samsoun, which receives the River Yeshil, and the Bay of Sinope, which receives the Kizil-Irmak,—at the mouths of which rivers there are plains formed by their alluvial deposit. From Cape Injeh westward to the Bosphorus, the coast-line of Anatolia is continuously elevated, with high mountains in the back-ground, occasionally projecting seawards as lofty promontories, of which Cape Kerempe is the most noteworthy; numerous rivulets come down from the mountains, and discharge themselves into

little cover; but excepting the Sakaria (the ancient *Sangarius*), there is no considerable river, and the water deepens very rapidly to 20 fathoms or more.

Although it is known that the depth of the central part of the basin of the Euxine reaches 1070 fathoms, the extent of this deep depression is not known. The increase of depth off the low-lying western and north-western shores is very gradual and regular, the lines of 20, 30, and 60 fathoms maintaining a general parallelism to the coast,—so that within this range the distance of a ship from land can be approximately ascertained by sounding. But outside the 60 fathom line the bottom deepens more rapidly and less regularly, depths of from 600 to 700 fathoms being met with in some parts within a few miles of it. The depth of the eastern portion of the basin has not been ascertained, but it is probably considerable.

The basin of the Euxine communicates with that of the Sea of Marmora by the Bosphorus, a strait about 20 miles long, from  $\frac{3}{4}$  to  $2\frac{1}{4}$  miles wide, and a depth of from 30 to 40 fathoms, resembling a broad river with high banks, which maintain a general parallelism, although the strait has seven distinct reaches. The region on either side presents distinct evidence of recent volcanic action.

The Sea of Marmora lies in the course of the channel that connects the Black Sea with the *Ægean*. Its bottom is depressed to a depth far greater than that of the channel of which it is an expansion. Its length from strait to strait is 110 geographical miles, and its greatest breadth is 43 miles. Round the shores, the depth generally ranges from 10 to 30 fathoms; but it rapidly increases in most parts; and depths of 100, 133, 266, and even 355 fathoms have been met with, chiefly near the line connecting the two straits.

The channel which connects the Sea of Marmora with the *Ægean* is properly termed the Hellespont,—the name Dardanelles, by which it is commonly known, being really that of the fortifications erected on the two sides of the strait by which its passage is guarded. The Sea of Marmora narrows to a breadth of ten miles towards the north-eastern entrance of the channel; at Gallipoli, the distance between the two shores suddenly contracts to about two miles, and between this and the *Ægean* end of the strait, that distance is further diminished at certain points to even less than a mile. The depth of the channel is considerable, being for the most part between 30 and 50 fathoms.

*Climate.*—The climate of the Black Sea is very peculiar,—the range of temperature between the summer and winter extremes being remarkably great. The summer isotherm of 70° runs a little way inland, nearly parallel to its north-western coast-line, whilst the summer isotherm of 80° passes along its southern coast-line, which is as warm as the southern coast-line of the Mediterranean, nearly 10° nearer the equator. Thus the whole area of the Black Sea lies, like that of the Mediterranean, between these two summer isotherms; and the evaporation from its surface during the warmer part of the year will consequently be enormous. During the winter months, on the other hand, the Black Sea is exposed to the chilling winds which come down to it from the Arctic regions, sweeping over the snow-covered plains of Russia, without any interruption from high mountain ranges; and nearly the whole of its area lies between the winter isotherms of 30° and 40°, the former passing round its northern coast, while the latter passes from the Bosphorus to Poti in Mingrelia. Thus it happens that, notwithstanding their high summer temperature, the northern shores of the Black Sea are more or less blockaded with ice during the winter,—this being most the case where the water is shallowest, and has its salinity lowered by the entrance of rivers. Thus the Sea of Azoff

and the Strait of Yenekale are always frozen over, as are also the northern ports between the Crimea and Odessa; while, on the other hand, the harbours of Kafia and Sebastopol are never closed, and that of Odessa but seldom. It is recorded, however, that in 401 A.D. the surface of the Euxine was almost entirely frozen over, and that when the ice broke up enormous masses were seen floating in the Sea of Marmora for thirty days. In 762 A.D., again, the sea is said to have been frozen from the terminal cliffs of the Caucasus to the mouths of the Dniester, Dnieper, and Danube; and contemporary writers assert that the quantity of snow which fell on the ice rose to the height of from 30 to 40 feet, completely hiding the contour of the shores, and that on the breaking up of the ice in the month of February, the masses of it carried by the current into the Sea of Marmora reunited in one immense sheet across the Hellespont between Sestos and Abydos. No similar occurrence has been subsequently recorded.

The winds of the Black Sea are variable, except during summer, when they generally blow from the north-east, while at other seasons southerly or south-westerly winds often prevail. The area is very subject to fogs, which appear to proceed from the precipitation by a cold northerly current of the moisture which has been raised by evaporation from its surface, or has been brought thither by S. or S.W. winds. This sea is remarkable for the rapidity with which violent storms not unfrequently arise, often to subside again with like rapidity.

*Drainage Area.*—The drainage area of the Black Sea is one of the largest in the world, being estimated at 939,000 square miles, of which 825,000 lie in Europe and 114,000 in Asia. The largest of its rivers is the Danube, which has a total length of 1560 miles, and drains the immense area of 306,000 square miles in the southern portion of Central Europe; its western tributaries lie so near the southern tributaries of the Rhine and the Elbe, that a canal-communication has been established between them, by which small vessels can pass between the North Sea and the Black Sea. The Dnieper has a total length of 1050 miles, and drains an area of 195,500 square miles, chiefly in Western Russia and Russian Poland; its northern tributaries approach the southern tributaries of the Niemen; and a canal-communication has thus been established between the Black Sea and the Baltic. The Don, with a length of 1000 miles, drains an area of 176,500 square miles in South-Eastern Russia, which is continuous with the basin of the Volga, being separated from it by the Sarpa Hills. Between the Dnieper and Danube, the two smaller rivers, the Bug and the Dniester, traverse respectively 440 and 660 miles in their course, and drain an area of more than 50,000 square miles (ten times greater than that of the Thames). Passing eastwards, we come to the Kuban, which drains the northern slopes of the Caucasus and the plains inhabited by the Black Sea Cossacks, and debouches near the entrance to the Sea of Azoff. But there is no other important river on the eastern coast, most of the water flowing from the mountainous region that separates the Black Sea from the Caspian passing into the latter. The northern slopes of the Armenian mountains furnish tributaries of the River Chouruk, a stream of moderate size, which enters the Black Sea to the east of Trebizond. On the southern coast the principal river is the Kizil Irmak (the *Halys* of the ancients), which drains the large central area of the northern portion of Asia Minor, while towards the western side the River Sakaria drains a large area in the province of Anatolia. Along the whole western coast of the Black Sea, from the Bosphorus to the Danube, no large stream empties itself into the basin,—most of the drainage of Rumilia being carried off by the River Maritza into the *Ægean*, whilst that of Bulgaria contributes to swell the Danube.

The greater part of the drainage area of the Black Sea, like that of the Baltic, is covered with snow during the winter months, and comparatively little water is then brought down by the rivers. With the return of spring, however, the melting of the snow increases the volume of fresh water poured into the sea, its rivers being at their highest in early summer. By far the larger part of this water is discharged at its north-western border, and the elevation of level thus produced establishes a current that sets along its western shore towards the outlet of the Bosphorus. But as the narrowness of this channel does

not allow it to give immediate passage to the overflow, a portion of the current continues to pass onwards along the southern shore, and, when more than usually strong, even completes the entire circuit of the sea. There are no perceptible tides in this basin.

As might be expected from the foregoing, the salinity of Black Sea water varies (like that of the Baltic) at different periods of the year; but in consequence of the much greater total mass of water contained in the deeper part of this basin, the variation of its salinity is by no means so great as that of Baltic waters,—the usual range of its sp. gr. being from about 1.012 to 1.014, which corresponds to a little less or a little more than half the salinity of ordinary sea-water.

The most contradictory notions have prevailed as to the influence of the Euxine waters on those of the Mediterranean,—some writers having represented the rivers of the former as important contributors to the maintenance of the level of the Mediterranean, which the enormous evaporation from that area is always tending to reduce; whilst others assert that the Bosphorus and Dardanelles' currents are entirely due to the agency of wind. A valuable *datum* is afforded by the condition of the Caspian, in the closed basin of which, contracted by a reduction of its level to 80 feet below that of the Black Sea, an equality is now established between the amount of water lost by evaporation and that which is restored by its rivers and by the rainfall on its own surface. The areas of the Caspian and of the Euxine are not very different; and though the axis of the former basin lies north and south, while that of the latter lies east and west,—so that the northern portion of the Caspian is colder, and the southern portion warmer, than the northern and southern portions of the Black Sea,—the annual average temperatures, and consequently the total evaporation, of the two areas cannot differ much. Now, the drainage area of the Volga is equal to that of the Danube, the Dnieper, and the Dniester taken together; the Ural, with the two Transcaucasian rivers, Kur and Araxes, may be considered as equalling the Don; and thus the Bug and the rivers of the Caucasus and Asia Minor may be regarded as furnishing the excess of water discharged into the Black Sea above that which is received by the Caspian. Hence, as the whole of the river and rain water annually discharged into the basin of the Caspian is only sufficient to replace that which is lost by evaporation during the same period, it follows that we may in like manner regard the principal rivers of the Black Sea as only fulfilling the same function; consequently, if the Bosphorus were closed, the water which they pour into the Euxine basin would not produce any elevation of its level, being entirely dissipated by evaporation. Thus the water which the Black Sea has to spare for the Mediterranean only represents the *excess* of its river supply above the total river supply of the Caspian; and that this excess is small in amount appears from the fact that the salinity of the water of the *Ægean* is not sensibly reduced by it below that of the Mediterranean. But that there is some excess is evident from the consideration that if the evaporation of the Black Sea were merely neutralized by the return of fresh water, its water would have the salinity of that of the great basin with which it is in free communication, instead of containing only about half its proportion. It is further evident, on the other hand, that a continual efflux of the half-salt water of the Black Sea, to be replaced only by the fresh water discharged into its basin by rain and rivers, would in time completely drain that basin of its salt; and as its proportion, though liable to seasonal variation, undergoes no sensible diminution from year to year, it is obvious that the salt which passes out must be replaced by a re-entry of *Ægean* water. The mode in which this re-

placement is effected has been recently elucidated by a careful examination of the currents of the Black Sea straits, of which an account will be presently given.

It is during the winter months, when a large proportion of the drainage area of the Black Sea rivers is covered with snow, that the supply of water is at its minimum; but it is then that the evaporation from its surface is also at its minimum; so that there is no reason to suppose that the level of the Black Sea ever falls below that of the *Ægean*. There can be no reasonable doubt that during the spring and early summer, when the melting of the snows causes the rivers to swell to their highest, the quantity of fresh water thus brought into the basin, being greater than that which is lost by evaporation (as is shown by the general reduction which then takes place in the salinity of its contents), would cause a considerable rise of level, if this were not kept down by the outflow through the straits.

*Dardanelles and Bosphorus Currents.*—It has been known from very early times that a current, usually of considerable strength, sets outwards through the Black Sea straits during a large part of the year,—its rate being subject, however, to considerable variation in accordance with the breadth of the channel, and also with the force and direction of the wind. Thus, when the N.E. wind is of average strength, the rate of the current at Gallipoli is about 1 knot per hour; whilst in the "Narrows" at Chanak Kalesi it is about 3 knots, increasing with a strong wind to about  $4\frac{1}{2}$  knots. In calm weather the out-current of the Dardanelles is usually slack; and if, as sometimes happens even during the general prevalence of N.E. winds, the wind should suddenly blow strongly from the S.W., the surface outflow may be entirely checked. It requires a continuance of strong S.W. wind, however, to reverse its direction; and its rate, when thus reversed, never equals that of the out-current. The Bosphorus current has not been as carefully studied as that of the Dardanelles; but its rate is greater, in accordance with the limitation of its channel, which is scarcely wider at any point than the "Narrows" of the Dardanelles. It continues to run, though at a reduced rate, when there is no wind, and is not known to be ever reversed except in winter after a S.W. gale of long duration. Even then it appears that the reversal is confined to the superficial stratum,—the direction of the sub-surface water-currents proving that there is still an outflow from the Black Sea into the *Ægean*. Hence it cannot be reasonably maintained that it is by this occasional and superficial reversal that the immense mass of salt continually being carried outwards by the Bosphorus and Dardanelles currents is restored to the Black Sea basin.

The existence of an inward under-current (although controverted by an authority of weight) has been clearly demonstrated by the recent experimental researches of Captain Wharton, R.N., of H.M. surveying ship "Shearwater." By the use of a "current-drag," so constructed and suspended as always to present a large vertical surface, it was found that when the outward surface-current was at its strongest there was an inward under-current sufficiently strong and rapid to carry inwards the suspending buoy.

The difference in specific gravity of water obtained from different depths was found, in Captain Wharton's investigations (as in those previously made by Dr Carpenter, in conjunction with Captains Calver and Nares, in the Strait of Gibraltar), to afford, under ordinary circumstances, a very sure indication of the direction of the movement of each stratum,—the heavy water of the *Ægean*, as a rule, flowing inwards, and the lighter water of the Black Sea flowing outwards. And it was indicated alike by both modes of inquiry that the two strata move in opposite directions, one over the other, with very little intermixture

or retardation,—the transition between them being usually very abrupt. The anomalies occasionally met with seemed due to the prevalence of opposite winds at the two ends of the straits.

Putting aside for the time the influence of wind, the double current of the Black Sea straits may be accounted for as follows:—The excess of fresh water discharged into the basin of the Black Sea is always tending to raise its level; and this produces an outward surface-current, which as regularly tends to keep it down. On the other hand, the reduced salinity of the Euxine column gives to the Ægean column an excess of lateral pressure, which causes its lower stratum to flow back into the Black Sea basin; and as the equality in the amount of salt thus carried back by the under-current to that which escapes by the surface-current is indicated by the maintenance of the standard salinity of Black Sea water, it follows that, as the water which escapes contains about half as much salt in equal measures as the water that enters, the volume of the latter must be about half that of the former.

Now, when the rate of the surface-current is augmented by a N.E. wind, there will be not only a more rapid lowering of the Black Sea level, but a tendency to elevation at the Ægean end of the strait; and as this will augment the difference between the downward, and therefore the lateral, pressures of the two columns, the force and volume of the inward under-current will be augmented. When, on the other hand, the S.W. direction of the wind reverses the surface-current, it tends, by piling up the water at the N.E. end of the strait, to augment the weight of the Black Sea column,—the excess of which (notwithstanding its lower salinity) over that of the Ægean column, will then produce a reversal of the under-current also. When the S.W. wind is moderate enough to check the surface outflow without reversing it, the inward under-current will likewise be brought to a stand; for a slight rise in the level of the Black Sea column will cause its greater height to compensate for the greater salinity of the Ægean column, so that their lateral pressures will be equalized.—We have here a “pregnant instance” of the potency of slight differences in level and in salinity to produce even rapid movements of considerable bodies of water; and a strong confirmation is thus afforded by direct observation to the doctrine that differences in density produced by temperature are adequate to give rise to still larger, though slower, movements of the same kind in the great ocean basins.

*Zoology.*—The basin of the Black Sea is frequented by seals, dolphins, and porpoises; and it is said that in the neighbourhood of the mouths of the Danube the porpoise is perfectly white, so that the Greek mariners, when they catch sight of it, know that they are in the current of that river, although in 30 fathoms water, and many leagues from land. The fish of the Black Sea appear to be for the most part the same as those of the Caspian and the Sea of Aral. Its northern rivers bring into it the sturgeon, sterlet, and other fresh-water fish, which can live in and near their estuaries. On the other hand, its waters are elsewhere salt enough for the mackerel, whiting, mullet, turbot, and sole. The *pelamys* spoken of by Strabo as issuing from the *Mæotis* (Sea of Azoff) in shoals, and as following the coast of Asia, is still abundant; though commonly spoken of as the nerling, it seems to be a large sprat. The principal fish that enters this basin from the Mediterranean is the tunny, which comes into the Black Sea in large numbers at the spawning season. The other inhabitants of the Black Sea have not been especially studied; but it may be noted that a species of *Teredo* is very common and destructive both to ships and to wooden harbour-works, and that it is not confined to the saltier waters of the basin, but frequents the estuaries where the water is almost fresh. (W. A. C.)

**BLACKBIRD** (*Turdus merula*), belongs to the *Turdidae* or Thrushes, a family of Dendrostrual Birds. The plumage of the male is of a uniform black colour, that of the female various shades of brown, while the bill of the male, especially during the breeding season, is of a bright gamboge yellow. The blackbird is of a shy and restless disposition, courting concealment, and rarely seen in flocks, or otherwise than singly or in pairs, and taking flight when startled with a sharp shrill cry. It builds its nest in March, or early in April, in thick bushes or in ivy-clad trees, and usually rears two broods each season. The nest is a neat structure of coarse grass and moss, mixed with earth, and plastered internally with mud, and here the female lays from four to six eggs of a blue colour speckled with black. The blackbird feeds chiefly on fruits, worms, the larvæ of insects, and snails, extracting the latter from their shells by dexterously chipping them on stones; and though it is generally regarded as an enemy of the garden, it is probable that the amount of damage done by it to the fruit is amply compensated for by its undoubted services as a vermin-killer. The notes of the blackbird are rich and full, but monotonous as compared with those of the song-thrush. Like many other singing birds it is, in the wild state, a mocking-bird, having been heard to imitate the song of the nightingale, the crowing of a cock, and even the cackling of a hen. In confinement it can be taught to whistle a variety of tunes, and even to imitate the human voice. It is found throughout Europe, Palestine, and the northern parts of Africa, and Darwin states that he observed it as far west as the Azores. Individuals reared in Britain, it is said, do not migrate; but annually great flocks arrive on the eastern shores of England from more northern countries, remaining for a few days only, and then proceeding southward.

**BLACKBURN**, a large manufacturing town and municipal borough of England, situated on a stream called, in *Domesday Book*, the Blackeburn, but now only known as “The Brook,” in the north-eastern division of the county of Lancaster, 209 miles from London by railway, 15 E. of Preston, and 30 N.N.W. of Manchester. Besides its numerous churches and chapels, the public buildings of Blackburn comprise a large town-hall, finished in 1856, a market-house, an exchange, built in 1865, a county court (1863), public baths (1864), and, outside the town, an infirmary (1862). A public park of about 50 acres was opened in 1857. Since about 1865 a variety of extensive and important improvements have been effected in the general condition of the town, which is now well paved and lighted, has an elaborate system of drainage, and receives an abundant supply of water. Previous to that date the so-called streets were, over a large area, almost useless for purposes of traffic. The staple trade of Blackburn has long been the manufacture of cotton, for the development of which a great deal was done by some natives of the town, such as Peel and Hargreaves, in the last century. The subordinate branches include woollen factories, engineering works, iron foundries, and breweries. In 1871 there were employed in the cotton factories 14,220 men and 17,075 women, of twenty years of age and upwards; the engineering works gave employment to 356 men, and the iron manufacture to 794. Coal, and lime, and building stone are abundant in the neighbouring district, which is, however, very far from fertile. The Leeds and Liverpool Canal passes the town, which has also extensive railway communication. Blackburn is a place of some antiquity, and its parish church of St Mary's (for the most part taken down in 1813), dated from before the Norman Conquest. It was for a time the chief town of a district known as Blackburnshire, and as early as the reign of Elizabeth ranked as a flourishing market town. About

the middle of the 17th century it became famous for its "checks," which were afterwards superseded by a similar linen-and-cotton fabric known as "Blackburn greys." A charter of incorporation was obtained in 1851, when W. H. Hornby, one of the largest cotton manufacturers of the place, was elected first mayor. The population of the town, which was only about 5000 in 1790, had increased by 1801 to 11,980. In 1861 there were 11,306 inhabited houses in the municipal borough; and by the census of 1871 the number had increased to 14,690. In the former year the population of the municipal borough was 63,126, and in 1871 it amounted to 76,339 (males 36,099, females 40,240), while the parliamentary burgh with its extended boundaries contained 82,928 inhabitants. Blackburn returns two members to parliament.

**BLACKCOCK** (*Tetrao tetrix*), a Gallinaceous Bird belonging to the family *Tetraonidae* or Grouse, the female of which is known as the Grey Hen and the young as Poult. In size and plumage the two sexes offer a striking contrast, the male weighing about 4 lb, its plumage for the most part of a rich glossy black shot with blue and purple, the lateral tail feathers curved outwards so as to form, when raised, a fan-like crescent, and the eyebrows destitute of feathers and of a bright vermilion red. The female, on the other hand, weighs only 2 lb, its plumage is of a russet brown colour irregularly barred with black, and its tail feathers are of the ordinary form or but slightly forked. The males are polygamous, and during autumn and winter associate together, feeding in flocks apart from the females; but with the approach of spring they separate, each selecting a locality for itself, from which it drives off all intruders, and where morning and evening it seeks to attract the other sex by a display of its beautiful plumage, which at this season attains its greatest perfection, and by a peculiar cry, which Selby describes as "a crowing note, and another similar to the noise made by the whetting of a scythe." Its nest, composed of a few stalks of grass, is built on the ground, usually beneath the shadow of a low bush or a tuft of tall grass, and here the female lays from six to ten eggs of a dirty-yellow colour speckled with dark brown. The blackcock then rejoins his male associates, and the female is left to perform the labours of hatching and rearing her young brood. The plumage of both sexes is at first like that of the female, but after moulting the young males gradually assume the more brilliant plumage of their sex. There are also many cases on record, and specimens may be seen in the principal museums, of old female birds assuming, to a greater or less extent, the plumage of the male. The blackcock is very generally distributed over the highland districts of Northern and Central Europe, and in some parts of Asia. It is found on the principal heaths in the south of England, but is specially abundant in the Highlands of Scotland, where great numbers are killed annually during the statutory shooting season, which commences on August 20 and extends to December 10. The bird does not occur in Ireland, and all attempts that have hitherto been made to naturalize it there have failed, although it now thrives and breeds in the south-west of Scotland within 21 miles of the Irish coast. During summer, blackcock reside chiefly on the ground, feeding on seeds, the young shoots of heath, and insects; in autumn they regularly frequent the stubble fields; but in winter they perch on trees, especially the birch and fir, the tender shoots of which then form their principal food.

**BLACKLOCK**, THOMAS, a Scottish poet and divine, was born of humble but respectable parents at Annan, in Dumfriesshire, in 1721. When not quite six months old he lost his sight by the smallpox. Under this misfortune, his father and friends endeavoured to amuse him as he grew up by reading to him various books,—among others,

the works of Milton, Spenser, Prior, Pope, and Addison. Shortly after the death of his father, which took place in 1740, some of Blacklock's poems began to be handed about among his acquaintances and friends, and a few specimens were brought under the notice of Dr Stevenson of Edinburgh, who was struck by their merits, and formed the design of giving the author a classical education. Blacklock, in consequence, was enrolled a student of divinity in the university of Edinburgh in 1741, and continued his studies under the patronage of Dr Stevenson till 1745, when he retired to Dumfries, and resided there until the close of the civil war. When peace had been restored, he returned to the university, and during this residence in Edinburgh he made the acquaintance of several literary men, in particular of Hume, who was extremely useful to him in the publication by subscription of the 4th edition of his poems in 1756. Two editions in 8vo had previously been published at Edinburgh, in 1746 and in 1754. After applying closely for a considerable time to the study of theology, he was in 1762 ordained minister of the church of Kirkcudbright; but owing to an opposition to the appointment on the part of the parishioners, he resigned his right to the living, and accepted a moderate annuity in its stead. In 1767 the degree of doctor in divinity was conferred on him by Marischal College, Aberdeen. He died on the 7th of July 1791. His poems are pleasing but weak effusions, and there is nothing remarkable about them save that they were written by one who laboured under the misfortune of blindness.

**BLACKMORE**, SIR RICHARD, a physician, and voluminous writer of theological and poetical works, was born in Wiltshire about 1650. He was educated at Westminster and Oxford, graduated in medicine at Padua, and settled in practice as a physician in London. Having early declared in favour of the Revolution, he was in 1697 chosen one of King William's physicians in ordinary, and received the honour of knighthood. On Queen Anne's accession, Sir Richard was also appointed one of her physicians, which office he held for some time. He died on the 9th October 1729. Blackmore had a passion for writing epics. No fewer than seven long poems were published by him between 1695 and 1723. The first was *Prince Arthur*, in 10 books; then followed *King Arthur*, in 12 books; *Eliza*, in 10; *Creation*, in 7; *Redemption*, in 6; *Nature of Man*, in 3; and *Alfred*, in 12. Of these *Creation*, a philosophic poem directed against the atomic theories of Epicurus and Lucretius, and intended to refute the atheism of Vanini, Hobbes, and Spinoza, and to unfold the intellectual philosophy of Locke, has been the most favourably received. Addison and Johnson praised it highly, the latter anticipating that this poem would transmit the author to posterity "among the first favourites of the English muse." It would be hard to find grounds for this expectation, which has certainly not been realized. The poem, like everything else that Blackmore wrote, is dull and tedious, and exhibits in every part the author's want of true poetic sensibility and taste.

**BLACKPOOL**, a seaside town of England, in Lancashire, situated on the coast to the north of the estuary of the Ribble, about 20 miles W. of Preston by rail. It is largely frequented as a bathing-place. A good sandy beach, bracing air, and a fine view, are its chief attractions. In the end of last century it was a mere hamlet, but since then it has gradually increased. It has two churches, two market-halls, a court-house, and assembly rooms. The parade affords a fine promenade. A new pier was built in 1866. Population in 1871, 6100.

**BLACKSTONE**, SIR WILLIAM, an eminent English jurist, was born at London, July 10, 1723. He was a posthumous child, and his mother died before he was twelve

years old. From his birth the care of his education was undertaken by his maternal uncle Thomas Bigg, an eminent surgeon in London. When about seven years old he was sent to the Charterhouse School, and in 1735 he was admitted upon the foundation there by the nomination of Sir Robert Walpole. His progress was so rapid that at the age of fifteen he was at the head of the school, and qualified to be removed to the university, and he was accordingly entered a commoner at Pembroke College, Oxford, on the 30th of November 1738. At the time of entering he held an exhibition from his school, and in February following he was elected by his college to one of Lady Holford's exhibitions for Charterhouse scholars. He was a diligent student, devoting himself specially though not exclusively to the Greek and Roman poets. At the early age of twenty he compiled a treatise, entitled *Elements of Architecture*, intended for his own use only and not for publication, which was highly spoken of by those who were permitted to read it.

Having made choice of the profession of the law, he was entered in the Middle Temple, November 20, 1741. In a copy of verses of considerable merit, afterwards published by Dodsley in the fourth volume of his *Miscellanies*, entitled *The Lawyer's Farewell to his Muse*, he gave utterance to the regret with which he abandoned the pleasing pursuits of his youth for severer studies. Besides this, several fugitive pieces were at times communicated by him to his friends; and he left, but not with a view to publication, a small collection of juvenile pieces, consisting of both original poems and translations. Some notes which just before his death he communicated to Steevens, and which were inserted by the latter in his last edition of Shakespeare's works, show how well he understood the meaning and relished the beauties of his favourite English poet.

In November 1743 he was elected into the society of All Souls' College. In the November following he spoke the anniversary speech in commemoration of Archbishop Chichele, the founder, and the other benefactors to that house of learning, and was at the same time admitted actual fellow. From this period he divided his time between the university and the Temple, where he took chambers in order to attend the courts. In the former he pursued his academical studies, and on the 12th of June 1745 took the degree of bachelor of civil law; in the latter he applied himself closely to his profession, both in the hall and in his private studies; and on the 28th of November 1746 he was called to the bar. Though but little known or distinguished in Westminster Hall, he was actively employed, during his occasional residences at the university, in taking part in the internal management of his college. In May 1749, as a small reward for his services, and to give him further opportunities of advancing the interests of the college, Blackstone was appointed steward of its manors. In the same year, on the resignation of his uncle, Seymour Richmond, he was elected recorder of the borough of Wallingford in Berkshire. On the 26th of April 1750 he commenced doctor of civil law, and thereby became a member of the convocation, which enabled him to extend his views beyond the narrow circle of his own society, to the benefit of the university at large. In the summer of 1753 he took the resolution of wholly retiring to his fellowship and an academical life, still continuing the practice of his profession as a provincial counsel.

His lectures on the laws of England appear to have been an early and favourite idea; for in the Michaelmas term immediately after he quitted Westminster Hall, he entered on the duty of reading them at Oxford; and we are told by the author of his *Life*, that even at their commencement, the high expectations formed from the acknowledged abilities of the lecturer attracted to these lectures a very

crowded class of young men of the first families, characters, and hopes. Bentham, however, declares that he was a "formal, precise, and affected lecturer—just what you would expect from the character of his writings—cold, reserved, and wary, exhibiting a frigid pride." It was not till the year 1758 that the lectures in the form they now bear were read in the university. Mr Viner having by his will left not only the copyright of his abridgment, but other property to a considerable amount, to the University of Oxford, in order to found a professorship, fellowships, and scholarships of common law, Blackstone was on the 20th of October 1758 unanimously elected Vinerian professor; and on the 25th of the same month he read his first introductory lecture, which he published at the request of the vice-chancellor and heads of houses, and afterwards prefixed to the first volume of his celebrated *Commentaries*. It is doubtful whether the *Commentaries* were originally intended for the press; but many imperfect and incorrect copies having got into circulation, and a pirated edition of them being either published or preparing for publication in Ireland, the author thought proper to print a correct edition himself, and in November 1765 published the first volume, under the title of *Commentaries on the Laws of England*. The remaining parts of the work were given to the world in the course of the four succeeding years. It ought to be remarked, that before this period the reputation which his lectures had deservedly acquired for him had induced him to resume his practice in Westminster Hall; and, contrary to the general order of the profession, he who had quitted the bar for an academical life was sent back from the college to the bar with a considerable increase of business. He was likewise elected to parliament, first for Hindon, and afterwards for Westbury in Wilts; but in neither of these departments did he equal the expectations which his writings had raised. The part he took in the Middlesex election drew upon him the attacks of some persons of ability in the senate, and likewise a severe animadversion from the caustic pen of *Junius*. This circumstance probably strengthened the aversion he professed to parliamentary attendance, "where," he said, "amidst the rage of contending parties, a man of moderation must expect to meet with no quarter from any side." In 1770 he declined the place of solicitor general; but shortly afterwards, on the promotion of Sir Joseph Yates to a seat in the court of Common Pleas, he accepted a seat on the bench, and on the death of Sir Joseph succeeded him there also. Blackstone died on the 14th February 1780, in the fifty-seventh year of his age.

The design of the *Commentaries* is exhibited in his first Vinerian lecture printed in the introduction to them. The author there dwells on the importance of noblemen, gentlemen, and educated persons generally being well acquainted with the laws of the country; and his treatise, accordingly, is as far as possible a popular exposition of the laws of England. Falling into the common error of identifying the various meanings of the word law, he advances from the law of nature (being either the revealed or the inferred will of God) to municipal law, which he defines to be a rule of civil conduct prescribed by the supreme power in a state commanding what is right and prohibiting what is wrong. On this definition he founds the division observed in the *Commentaries*. The objects of law are rights and wrongs. Rights are either rights of persons or rights of things. Wrongs are either public or private. These four headings form respectively the subjects of the four books of the *Commentaries*.

Blackstone was by no means what would now be called a scientific jurist. He has only the vaguest possible grasp of the elementary conceptions of law. He evidently regards the law of gravitation, the law of nature, and the law of

England, as different examples of the same principle—as rules of action or conduct imposed by a superior power on its subjects. He propounds in terms a fallacy which is perhaps not yet quite expelled from courts of law, viz., that municipal or positive laws derive their validity from their conformity to the so-called law of nature or law of God. "No human laws," he says, "are of any validity if contrary to this." His distinction between rights of persons and rights of things, implying, as it would appear, that things as well as persons have rights, is attributable to a misunderstanding of the technical terms of the Roman law. In distinguishing between private and public wrongs (civil injuries and crimes) he fails to seize the true principle of the division. Austin, who accused him of following slavishly the method of Hale's *Analysis of the Law*, declares that he "blindly adopts the mistakes of his rude and compendious model, missing invariably, with a nice and surprising infelicity, the pregnant but obscure suggestions which it proffered to his attention, and which would have guided a discerning and inventive writer to an arrangement comparatively just." By the want of precise and closely-defined terms, and his tendency to substitute loose literary phrases, he falls occasionally into irreconcilable contradictions. Even in discussing a subject of such immense importance as equity, he hardly takes pains to discriminate between the legal and popular senses of the word, and, from the small place which equity jurisprudence occupies in his arrangement, he would scarcely seem to have realized its true position in the law of England. Subject, however, to these strictures the completeness of the treatise, its serviceable if not scientific order, and the power of lucid exposition possessed by the author demand emphatic recognition. Blackstone's defects as a jurist are more conspicuous in his treatment of the underlying principles and fundamental divisions of the law than in his account of its substantive principles.

Blackstone by an means confines himself to the work of a legal commentator. It is his business, especially when he touches on the framework of society, to find a basis in history and reason for all our most characteristic institutions. There is not much either of philosophy or fairness in this part of his work. Whether through the natural conservatism of a lawyer, or through his own timidity and subserviency as a man and a politician, he is always found to be a specious defender of the existing order of things. Bentham accuses him of being the enemy of all reform, and the unscrupulous champion of every form of professional chicanery. Austin says that he truckled to the sinister interests and mischievous prejudices of power, and that he flattered the overweening conceit of the English in their own institutions. He displays much ingenuity in giving a plausible form to common prejudices and fallacies, but it is by no means clear that he was not imposed upon himself. More undeniable than the political fairness of the treatise is its merit as a work of literature. It is written in a most graceful and attractive style, and although no opportunity of embellishment has been lost, the language is always simple and clear. Whether it is owing to its literary graces, or to its success in flattering the prejudices of the public to which it was addressed, the influence of the book in England has been extraordinary. Not lawyers only, and lawyers perhaps even less than others, accepted it as an authoritative revelation of the law. It performed for educated society in England much the same service as was rendered to the people of Rome by the publication of their previously unknown laws. It is more correct to regard it as a handbook of the law for laymen than as a legal treatise, and as the first and only book of the kind in England it has been received with somewhat indiscriminating reverence. It is certain that a vast amount of

the constitutional sentiment of the country has been inspired by its pages. To this day Blackstone's criticism of the English constitution would probably express the most profound political convictions of the majority of the English people. Long after it has ceased to be of much practical value as an authority in the courts, it remains the arbiter of all public discussions on the law or the constitution. On such occasions the *Commentaries* are apt to be construed as strictly as if they were a code. It is amusing to observe how much importance is attached to the *ipsissima verba* of a writer who aimed more at presenting a picture intelligible to laymen than at recording the principles of the law with technical accuracy of detail. (E. R.)

BLAINVILLE, HENRI-MARIE DUCROTAY DE, a distinguished naturalist, was born at Arques, near Dieppe, Sept. 12, 1777. About the year 1795 he entered the school of design at Rouen, but after a very short time he went to Paris, where he became a pupil of Vincent the painter. Attracted by the lectures of Cuvier and other eminent professors in the College of France, he commenced the study of anatomy, and in 1808 he took the degree of M.D. He now devoted himself to the study of natural history, particularly the department of myology, and he soon attracted the attention of Cuvier, who engaged him to draw some figures for one of his works, and to carry out some of the practical work of anatomy. He was also chosen by that illustrious professor to supply his place on occasions at the College of France and at the Athenæum, and in 1812 he obtained the vacant chair of anatomy and zoology in the Faculty of Sciences at Paris. His somewhat irascible disposition was probably one cause of the subsequent estrangement between him and Cuvier, which ended in an open and irreconcilable enmity. In 1825 Blainville was admitted a member of the Academy of Sciences; and in 1830 he was appointed to succeed Lamarck in the chair of natural history at the museum. This he resigned in 1832, being appointed on the death of Cuvier to the chair of comparative anatomy, which he continued to occupy for the space of eighteen years, and in the conduct of which he proved himself no unworthy successor to his great teacher. Blainville was found dead in a railway carriage while travelling between Rouen and Caen, May 1, 1850.

Besides a great variety of separate memoirs, he was the author of *Prodrome d'une Nouvelle Distribution Méthodique du Règne Animal*, 1816, *Osteographie ou Description Iconographique Comparée du Squelette*, &c., *Faune Française*, 1821-1830, *Cours de Physiologie Générale et Comparée*, 1833, *Manuel de Malacologie et de Conchyliologie*, 1825-1827, *Histoire des Sciences Naturelles au Moyen Âge*, 1845.

BLAIR, or PORT-BLAIR, the chief place in the convict settlement of the Andaman Islands in the Indian Ocean, is situated on the south-east shore of the South Andaman Island, in 11° 42' N. lat. and 93° E. long. In 1789 it was selected as a convict settlement, under orders of the Indian Government, by Lieutenant Blair, R.N., whose name the port bears. It possesses one of the best harbours in Asia, while its central position in the Bay of Bengal gives it immense advantage as a place of naval rendezvous for military operations in this part of the world. For further particulars see ANDAMAN ISLANDS.

BLAIR, DR HUGH, was born April, 7, 1718, at Edinburgh, where his father was a merchant. He entered Edinburgh University in 1730 and won the favourable notice of Professor Stevenson by an essay on the Beautiful, written for the logic class in his sixteenth year. On taking the degree of M.A. in 1739, he printed a thesis *De Fundamentis et Obligatione Legis Nature*, which contains an outline of the moral principles afterwards unfolded in his sermons. He was licensed to preach in 1741, and in a few months the earl of Leven, hearing of his eloquence,

presented him to the parish of Collessie in Fife. In 1743 he was elected to the second charge of the Canongate church, Edinburgh, where he performed the pastoral duties with great success, until removed to Lady Yester's, one of the city churches, in 1754. He married his cousin, Katherine Bannatyne, in 1748, and by her had a son, who died in infancy, and a daughter who lived to her twenty-first year. In 1757 the University of St Andrews conferred on him the degree of D.D., and in the following year he was promoted to the High Church, Edinburgh, the most important charge in Scotland. In 1759 he commenced, under the patronage of Lord Kames, to deliver a course of lectures on composition, the success of which led to the foundation of a chair of rhetoric and belles lettres in the Edinburgh University. To this chair he was appointed in 1762, with a salary of £70 a year. Having long taken interest in the Celtic poetry of the Highlands, he published in 1763 a laudatory *Dissertation* on Macpherson's *Ossian*, of which he maintained the authenticity. This critique, after being greatly overrated at the time, has now fallen into neglect. In 1777 the first volume of his *Sermons* appeared. It was succeeded by other four volumes, all of which met with the greatest success. Dr Samuel Johnson praised them warmly. "I love Blair's *Sermons*," Johnson said, "his doctrine is the best limited, the best expressed; there is the most warmth without fanaticism, the most rational transport." The *Sermons* were translated into almost every language of Europe, and in 1780, to signify the royal approbation, George III. conferred upon him a pension of £200 a year. In 1783 he retired from his professorship and published his *Lectures on Rhetoric* which he had carefully revised, and which have been frequently reprinted. He died, after a brief illness, on the 27th December 1801. In the church Blair belonged to the "moderate" or latitudinarian party, and his *Sermons* have been objected to as deficient in doctrinal definiteness. His once brilliant reputation is now becoming forgotten. His works display little originality, but are written in a flowing and elaborate style; and his *Rhetoric*, although inferior to Campbell's, and wanting in research and depth of thought, is unworthy of the neglect it has met with.

BLAIR, ROBERT, author of the well known poem entitled *The Grave*, was the eldest son of the Rev. Robert Blair, of Edinburgh. He was probably born at Edinburgh about the year 1700, and at the university of that city he received the elements of a classical education. He afterwards spent some time on the Continent. Upon his return he took orders, and in 1731 was ordained minister of Athelstaneford, in East Lothian, where he spent the remainder of his life. He died of fever, February 4, 1746, and was succeeded in his living by John Home, the author of *Douglas*. His fourth son became lord-president of the Court of Session. Blair wrote several other pieces besides *The Grave*; but that poem alone constitutes his title to rank as a poet. It consists of a succession of descriptions and reflections, which have no other connection except what they may derive from their relation to a common subject, but these are interspersed with striking allusions, picturesque imagery, touches of a rude though effective pathos, and a vein of sentiment at once natural and just. The rhythm is often harsh, and the versification frequently devoid of correctness, harmony, and grace; but it has nevertheless a masculine vigour and freshness about it, which more than atone for the defects in the finishing; while, in certain moods of the mind, the air of deep and almost manthropical melancholy diffused over the whole proves highly touching and impressive. Campbell, in the *Pleasures of Hope*, has borrowed, with a slight variation, a line from this poem—

"Its visits,  
Like those of angels, short and far between."

The vigorous, though occasionally rather forced, poetic conceptions of the author of *The Grave*, were finely illustrated in Cromek's edition, published in 1808, by the grandly wild designs of William Blake, engraved by the delicate burin of Schiavonetti. *The Grave* was first printed at London in 1743.

BLAKE, ROBERT, the famous English admiral of the Commonwealth, was born at Bridgwater in Somersetshire, in August 1598. His birth thus falls in the year before that of Cromwell; their lives ran parallel in the service of their country; their characters present many points of likeness; and they died within a few months of each other. Blake was the eldest son of a well-to-do merchant, and received his early education at the grammar school of Bridgwater. At the age of sixteen he was sent to Oxford, entering at first St Alban's Hall, but removing afterwards to Wadham College, then recently founded by his father's friend, Nicholas Wadham. He remained at the university till 1623, and though certainly not wanting in ability or in diligence, he missed, for some reason not clearly ascertained, such college preferment as he naturally aimed at. From Oxford, after taking his degree of M.A., he returned to his father's house, where, through the memorable and troubled years which followed, he led a quiet and retired life. His thorough honesty, his public spirit and disinterestedness, his courageous utterance of what he thought of the court and the church, of shipmoney and the High Commission Court and the licence of the times, made him a man of mark among his neighbours. And when, after eleven years of kingship without parliaments, a parliament was summoned to meet in April 1640, Blake was elected by the Presbyterian party to represent his native borough. This parliament, named "the Short," was dissolved in three weeks, and the career of Blake as a politician was suspended. Two years later the inevitable conflict began. Blake declared for the Parliament; and thinking, says Johnson, a bare declaration for right not all the duty of a good man, he raised a troop of horse in his county, and rendered such efficient service, that in 1643 he was entrusted with the command of one of the forts of Bristol. This he stoutly held during the siege of the town by Prince Rupert, and was near being hung for continuing his resistance after the governor had capitulated. In the following year Colonel Blake took Taunton by surprise, and notwithstanding its imperfect defences and inadequate supplies, held the town for the Parliament against two sieges by the Royalists, until July 1645, when it was relieved by Fairfax. Blake did not approve of the trial and execution of Charles I.; but he adhered to the Parliamentary party after the king's death, and within a month (February 1649) was appointed, with Colonels Dean and Popham, to the command of the fleet, under the title of General of the Sea. In April he was sent in pursuit of Prince Rupert, who with the Royalist fleet had entered the harbour of Kinsale in Ireland. There he blockaded the Prince for six months; and when the latter, in want of provisions, and hopeless of relief, succeeded in making his escape with the fleet and in reaching the Tagus, Blake followed him thither, and again blockaded him for some months. The king of Portugal refusing permission for Blake to attack his enemy, the latter made reprisals by falling on the Portuguese fleet, richly laden, returning from Brazil. He captured seventeen ships and burnt three, bringing his prizes home without molestation. After re victualling his fleet, he sailed again, captured a French man-of-war, and then pursued Prince Rupert once more to the harbour of Carthage. The Spanish governor would not allow him to violate the peace of a neutral port, and he therefore withdrew. In January 1651 he at last attacked the Royalist fleet in Malaga harbour, and destroyed the whole

with the exception of two ships. In consequence of the Portuguese protest against his proceedings, a formal investigation was instituted in England, which resulted in the approval of the home authorities. The thanks of Parliament were voted to Blake, and he was appointed warden of the Cinque Ports. He was continued in his office of admiral and general of the sea; and in May following he took, in conjunction with Ayscue, the Scilly Islands. For this service the thanks of Parliament were again awarded him, and he was soon after made a member of the Council of State. In 1652 war broke out with the Dutch, who had made great preparations for the conflict. In March the command of the fleet was given to Blake for nine months; and in the middle of May the Dutch fleet of forty-five ships, led by their great admiral Van Tromp, appeared in the Downs. Blake, who had only twenty ships, sailed to meet them, and the battle took place off Dover on May 19. The Dutch were defeated in an engagement of four or five hours, lost two ships, and withdrew under cover of darkness. Attempts at accommodation were made by the States, but they failed. Early in July war was formally declared, and in the same month Blake captured a large part of the Dutch fishery-fleet and the twelve men-of-war that formed their convoy. On September 28, Blake and Penn again encountered the Dutch fleet, now commanded by De Ruyter and De Witt, in the Downs, defeated it, and chased it for two days. The Dutch took refuge in Goree. A third battle was fought near the end of November. By this time the ships under Blake's command had been reduced in number to forty, and nearly the half of these were useless for want of seamen. Van Tromp, who had been reinstated in command, appeared in the Downs, with a fleet of eighty ships besides ten fire-ships. Blake, nevertheless, risked a battle, but was defeated, and withdrew into the Thames. It was in his first elation at this victory that Van Tromp carried the broom at his mast-head in his passage through the Channel, as a pledge of his determination to sweep the English off the seas. His bravado was speedily avenged. The English fleet having been refitted, put to sea again in February 1653; and on the 18th, Blake, at the head of eighty ships, encountered Van Tromp in the Channel. The Dutch force, according to Clarendon, numbered 100 ships of war, but according to the official reports of the Dutch, only seventy. The battle was severe, and continued through three days, the Dutch however retreating, and taking refuge in the shallow waters off the French coast. In this action Blake was severely wounded. In the change of Government introduced by the dismissal of the Long Parliament by Cromwell (April 1653) Blake did not interfere. "It is not," he said, "the business of a seaman to mind state affairs, but to hinder foreigners from fooling us." The three English admirals put to sea again in May; and on June 3d and 4th another battle was fought near the North Foreland. On the first day Dean and Monk were repulsed by Van Tromp; but on the second day the scales were turned by the arrival of Blake, and the Dutch retreated to the Texel. Ill health now compelled Blake to retire from the service for a time, and he did not appear again on the seas for about eighteen months; meanwhile he sat as a member of the Little Parliament (Barebones's). In November 1654 he was selected by Cromwell to conduct a fleet to the Mediterranean to exact compensation from the Duke of Tuscany, the knights of Malta, and the piratical states of North Africa, for wrongs done to English merchants. This mission he executed with his accustomed spirit and with complete success. Tunis alone dared to resist his demands, and Tunis paid the penalty of the destruction of its two fortresses by English guns. In the winter of 1655-56, war being declared against Spain, Blake was sent to cruise off Cadiz and the

neighbouring coasts, to intercept the Spanish shipping. One of his captains captured a part of the Plate fleet in September 1656. In April 1657 Blake, then in very ill health, suffering from dropsy and scurvy, and anxious to have assistance in his arduous duties, heard that the Plate fleet lay at anchor in the bay of Santa Cruz, in the island of Teneriffe. The position was a very strong one, defended by a castle and several forts with guns. Under the shelter of these lay a fleet of sixteen ships drawn up in crescent order. Captain Stayner was ordered to enter the bay and fall on the fleet. This he did. Blake followed him. Broad-sides were poured into the castle and the forts at the same time; and soon nothing was left but ruined walls and charred fragments of burnt ships. The wind was blowing hard into the bay; but suddenly, and fortunately for the heroic Blake, it shifted, and carried him safely out to sea. "The whole action," says Clarendon, "was so incredible that all men who knew the place wondered that any sober man, with what courage soever endowed, would ever have undertaken it; and they could hardly persuade themselves to believe what they had done; while the Spaniards comforted themselves with the belief that they were devils and not men who had destroyed them in such a manner." The English lost one ship and 200 men killed and wounded. The thanks of Parliament were voted to officers and men; and a very costly jewel (diamond ring) was presented to Blake, "as a testimony," says Cromwell in his letter of June 10th, "of our own and the Parliament's good acceptance of your carriage in this action." "This was the last action of the brave Blake." After again cruising for a time off Cadiz, his health failing more and more, he was compelled to make homewards before the summer was over. He died at sea, but within sight of Plymouth, August 17, 1657. His body was brought to London and embalmed, and after lying in state at Greenwich House was interred with great pomp and solemnity in Westminster Abbey. In 1661 Charles II. disgraced himself by ordering the exhumation of Blake's body, with those of the mother and daughter of Cromwell and several others. They were cast out of the abbey, and were reburied in the churchyard of St Margaret's. "But that regard," says Johnson, "which was denied his body has been paid to his better remains, his name and his memory. Nor has any writer dared to deny him the praise of intrepidity, honesty, contempt of wealth, and love of his country." Clarendon bears the following testimony to his excellence as a commander:—"He was the first man that declined the old track, and made it apparent that the science might be attained in less time than was imagined. He was the first man that brought ships to condemn castles on the shore, which had ever been thought very formidable, but were discovered by him to make a noise only, and to fright those who could be rarely hurt by them." A life of Blake is included in the work entitled *Lives, English and Foreign*. Dr Johnson wrote a short life of him, and in 1852 appeared Mr Hepworth Dixon's fuller narrative, *Robert Blake, Admiral and General at Sea*. (W. L. R. C.)

• BLAKE, WILLIAM, poet and painter, was born in London, on 28th November 1757. His father, James Blake, kept a hosier's shop in Broad Street, Golden Square; and from the scanty education which the young artist received, it may be judged that the circumstances of the family were not very prosperous. For the facts of William Blake's early life the world is indebted to a little book, called *A Father's Memoirs of a Child*, written by Dr Malkin, and published in 1806. Here we learn that young Blake quickly developed a taste for design, which his father appears to have had sufficient intelligence to recognize and assist by every means in his power. At the age of ten the boy was sent to a drawing school kept by Mr Pars

in the Strand, and at the same time he was already cultivating his own taste by constant attendance at the different art sale rooms, where he was known as the "little connoisseur." Here he began to collect prints after Michel Angelo, and Raphael, Durer, and Hemskerck, while at the school in the Strand he had the opportunity of drawing from the antique. After four years of this preliminary instruction Blake entered upon another branch of art study. In 1777 he was apprenticed to James Basire, an engraver of repute, and with him he remained seven years. His apprenticeship had an important bearing on Blake's artistic education, and marks the department of art in which he was made technically proficient. In 1778, at the end of his apprenticeship, he proceeded to the school of the Royal Academy, where he continued his early study from the antique, and had for the first time an opportunity of drawing from the living model.

This is in brief all that is known of Blake's artistic education. That he ever, at the academy or elsewhere, systematically studied painting we do not know; but that he had already begun the practice of water colour for himself is ascertained. So far, however, the course of his training in art schools, and under Basire, was calculated to render him proficient only as a draughtsman and an engraver. He had learned how to draw, and he had mastered besides the practical difficulties of engraving, and with these qualifications he entered upon his career. In 1780 he exhibited a picture in the Royal Academy Exhibition, conjectured to have been executed in water colours, and he continued to contribute to the annual exhibitions up to the year 1808. In 1782 he married Catherine Boucher, the daughter of a market-gardener at Battersea, with whom he lived always on affectionate terms, and the young couple after their marriage established themselves in Green Street, Leicester Fields. Blake had already become acquainted with some of the rising artists of his time, amongst them Stothard, Flaxman, and Fuseli, and he now began to see something of literary society. At the house of the Rev. Henry Mathew, in Rathbone Place, he used to recite and sometimes to sing poems of his own composition, and it was through the influence of this gentleman, combined with that of Flaxman, that Blake's first volume of poetry was printed and published in 1783. From this time forward the artist came before the world in a double capacity. By education as well as native talent, he was pledged to the life of a painter, and these *Poetical Sketches*, though they are often no more than the utterances of a boy, are no less decisive in marking Blake as a future poet.

For a while the two gifts are exhibited in association. To the close of his life Blake continued to print and publish, after a manner of his own, the inventions of his verse illustrated by original designs, but there is a certain period in his career when the union of the two gifts is peculiarly close, and when their service to one another is unquestionable. In 1784 Blake, moving from Green Street, set up in company with a fellow-pupil, Parker, as print-seller and engraver next to his father's house in Broad Street, Golden Square, but in 1787 this partnership was severed, and he established an independent business in Poland Street. It was from this house, and in 1787, that the *Songs of Innocence* were published, a work that must always be remarkable for beauty both of verse and of design, as well as for the singular method by which the two were combined and expressed by the artist. Blake became in fact his own printer and publisher. He engraved upon copper, by a process devised by himself, both the text of his poems and the surrounding decorative design, and to the pages printed from the copper plates an appropriate colouring was afterwards added by hand. The poetic genius already discernible in the first volume

of *Poetical Sketches* is here more decisively expressed, and some of the songs in this volume deserve to take rank with the best things of their kind in our literature. In an age of enfeebled poetic style, when Wordsworth, with more weighty apparatus, had as yet scarcely begun his reform of English versification, Blake, unaided by any contemporary influence, produced a work of fresh and living beauty, and if the *Songs of Innocence* established Blake's claim to the title of poet, the setting in which they were given to the world proved that he was also something more. For the full development of his artistic powers we have to wait till a later date, but here at least he exhibits a just and original understanding of the sources of decorative beauty. Each page of these poems is a study of design, full of invention, and often wrought with the utmost delicacy of workmanship. The artist retained to the end this feeling for decorative effect, but as time went on, he considerably enlarged the imaginative scope of his work, and decoration then became the condition rather than the aim of his labour.

Notwithstanding the distinct and precious qualities of this volume, it attracted but slight attention, a fact perhaps not very wonderful, when the system of publication is taken into account. Blake, however, proceeded with other work of the same kind. The same year he published *The Book of Thel*, more decidedly mystic in its poetry, but scarcely less beautiful as a piece of illumination, *The Marriage of Heaven and Hell* followed in 1790, and in 1793 there are added *The Gates of Paradise*, *The Vision of the Daughters of Albion*, and some other "Prophetic Books." It becomes abundantly clear on reaching this point in his career, that Blake's utterances cannot be judged by ordinary rules. The *Songs of Experience*, put forth in 1794 as a companion to the earlier *Songs of Innocence*, are for the most part intelligible and coherent, but in these intervening works of prophecy, as they were called by the author, we get the first public expression of that phase of his character and of his genius upon which a charge of insanity has been founded. The question whether Blake was or was not mad seems likely to remain in dispute, but there can be no doubt whatever that he was at different periods of his life under the influence of illusions for which there are no outward facts to account, and that much of what he wrote is so far wanting in the quality of sanity as to be without a logical coherence. On the other hand, it is equally clear that no madness imputed to Blake could equal that which would be involved in the rejection of his work on this ground. The greatness of Blake's mind is even better established than its frailty, and in considering the work that he has left we must remember that it is by the sublimity of his genius, and not by any mental defect, that he is most clearly distinguished from his fellows. With the publication of the *Songs of Experience* Blake's poetic career, so far at least as ordinary readers are concerned, may be said to close. A writer of prophecy he continued for many years, but the work by which he is best known in poetry are those earlier and simpler efforts, supplemented by a few pieces taken from various sources, some of which were of later production. The body of Blake's intelligible verse is now made accessible to the public, in Mr W. Rossetti's edition of his works, published in the Aldine series, and to this volume those readers may be referred who desire to know the foundation upon which the poet's fame has been built. But although Blake the poet ceases in a general sense at this date, Blake the artist is only just entering upon his career. In the *Songs of Innocence* and *Experience*, and even in some of the earlier *Books of Prophecy*, the two gifts worked together in perfect balance and harmony; but at this point the supremacy of the artistic faculty

asserts itself, and for the remainder of his life Blake was pre-eminently a designer and engraver. The labour of poetical composition continues, but the product passes beyond the range of general comprehension; while, with apparent inconsistency, the work of the artist gains steadily in strength and coherence, and never to the last loses its hold upon the understanding. It may almost be said without exaggeration that his earliest poetic work, *The Songs of Innocence*, and nearly his latest effort in design, the illustrations to the *The Book of Job*, take rank among the sanest and most admirable products of his genius. Nor is the fact, astonishing enough at first sight, quite beyond a possible explanation. As Blake advanced in his poetic career, he was gradually hindered and finally overpowered by a tendency that was most serviceable to him in design. His inclination to substitute a symbol for a conception, to make an image do duty for an idea, became an insuperable obstacle to literary success. He endeavoured constantly to treat the intellectual material of verse as if it could be moulded into sensuous form, with the inevitable result that as the ideas to be expressed advanced in complexity and depth of meaning, his poetic gifts became gradually more inadequate to the task of interpretation. The earlier poems dealing with simpler themes, and put forward at a time when the bent of the artist's mind was not strictly determined, do not suffer from this difficulty; the symbolism then only enriches an idea of no intellectual intricacy; but when Blake began to concern himself with profounder problems the want of a more logical understanding of language made itself strikingly apparent. If his ways of thought and modes of workmanship had not been developed with an intensity almost morbid, he would probably have been able to distinguish and keep separate the double functions of art and literature. As it is, however, he remains as an extreme illustration of the ascendancy of the artistic faculty. For this tendency to translate ideas into image, and to find for every thought, however simple or sublime, a precise and sensuous form, is of the essence of pure artistic invention. If this be accepted as the dominant bent of Blake's genius, it is not so wonderful that his work in art should have strengthened in proportion as his poetic powers waned; but whether the explanation satisfies all the requirements of the case or not, the fact remains, and cannot be overlooked by any student of Blake's career.

In 1796 Blake was actively employed in the work of illustration. Edwards, a bookseller of New Bond Street, projected a new edition of Young's *Night Thoughts*, and Blake was chosen to illustrate the work. It was to have been issued in parts, but for some reason not very clear the enterprise failed, and only a first part, including forty-three designs, was given to the world. These designs were engraved by Blake himself, and they are interesting not only for their own merit but for the peculiar system by which the illustration has been associated with the text. Quite recently it has been discovered that the artist had executed original designs in water colour for the whole series, and these drawings, 537 in number, form one of the most interesting records of Blake's genius. Mr Gilchrist, the painter's careful and sympathetic biographer, in commenting upon the engraved plates, regrets the absence of colour, "the use of which Blake so well understood, to relieve his simple design and give it significance," and an examination of the original water colour drawings fully supports the justice of his criticism. Soon after the publication of this work Blake was introduced by Flaxman to the poet Hayley, and in the year 1801 he accepted the suggestion of the latter, that he should take up his residence at Felpham in Sussex. The mild and amiable poet had planned to write a life of Cowper, and for the

illustration of this and other works he sought Blake's help and companionship. The residence at Felpham continued for three years, partly pleasant and partly irksome to Blake, but apparently not very profitable to the progress of his art. One of the annoyances of his stay was a malicious prosecution for treason set on foot by a common soldier whom Blake had summarily ejected from his garden; but a more serious drawback was the increasing irritation which the painter seems to have experienced from association with Hayley. In 1804 Blake returned to London, to take up his residence in South Moulton Street, and as the fruit of his residence in Felpham, he published, in the manner already described, the prophetic books called the *Jerusalem*, *The Emanation of the Giant Albion*, and *Milton*. The first of these is a very notable performance in regard to artistic invention. Many of the designs stand out from the text in complete independence, and are now and then of the very finest quality.

In the years 1804-1805 Blake executed a series of designs in illustration of Blair's *Grave*, of much beauty and grandeur, though showing stronger traces of imitation of Italian art than any earlier production. These designs were purchased from the artist by an adventurous and unscrupulous publisher, Cromek, for the paltry sum of £21, and afterwards published in a series of engravings by Schiavonetti. Despite the ill treatment Blake received in the matter, and the other evils, including a quarrel with his friend Stothard as to priority of invention of a design illustrating the *Canterbury Pilgrims*, which his association with Cromek involved, the book gained for him a larger amount of popularity than he at any other time secured. Stothard's picture of the *Canterbury Pilgrims* was exhibited in 1807, and in 1809 Blake, in emulation of his rival's success, having himself painted in water colour a picture of the same subject, opened an exhibition, and drew up a *Descriptive Catalogue*, curious and interesting, and containing a very valuable criticism of Chaucer.

The remainder of the artist's life is not outwardly eventful. In 1813 he formed, through the introduction of George Cumberland of Bristol, a valuable friendship with Mr John Linnell and other rising water colour painters. Amongst the group Blake seems to have found special sympathy in the society of Varley, who, himself addicted to astrology, encouraged Blake to cultivate his gift of inspired vision; and it is probably to this influence that we are indebted for several curious drawings made from visions, especially the celebrated "ghost of a flea" and the very humorous portrait of the builder of the Pyramids. In 1821 Blake removed to Fountain Court, in the Strand, where he died 1827. The chief work of these last years was the splendid series of engraved designs in illustration of the book of Job. Here we find the highest imaginative qualities of Blake's art united to the technical means of expression which he best understood. Both the invention and the engraving are in all ways remarkable, and the series may fairly be cited in support of a very high estimate of his genius. None of his works are without the trace of that peculiar artistic instinct and power which seizes the pictorial element of ideas, simple or sublime, and translates them into the appropriate language of sense; but here the double faculty finds the happiest exercise. The grandeur of the theme is duly reflected in the simple and sublime images of the artist's design, and in the presence of these plates we are made to feel the power of the artist over the expressional resources of human form, as well as his sympathy with the imaginative significance of his subject.

A life of Blake, with selections from his works by Alexander Gilchrist, was published in 1863; in 1868 Mr Swinburne published a critical essay on his genius re-

markable for a full examination of the Prophetic Books, and still more recently Mr William Rossetti has published a memoir prefixed to an edition of the poems. (J. C. C.)

**BLANC, MONT**, the highest, and in other respects one of the most remarkable mountains in Europe, is situated in that division of the great Alpine system known as the Pennine Alps, in  $45^{\circ} 49' 53''$  N. lat. and  $6^{\circ} 51' 51''$  E. long. It rises almost in the shape of a pyramid to the height of 15,780 feet, and is visible at a distance of 130 miles to the west. The mass of the mountain is composed of granite, covered with strata of schists and limestones. To the N.E. lies the beautiful vale of Chamouni, and on the S.W. the Allée Blanche. Of the numerous glaciers that send their ice-streams down its sides the most remarkable is the Mer de Glace, which winds down its northern slope towards Chamouni, and gives birth to the River Arve. The ascent of Mont Blanc was first accomplished in 1786 by a guide named Jacques Balmat, who shortly afterwards led Dr Paccard, a local physician, to the summit, and thus gave him the honour of being the first person of scientific education to make known the possibility of the undertaking. De Saussure, the naturalist, ascended in the following year, and when the Italian naturalist Imperiale de Saint-Angelo made the ascent in 1810 he had been preceded by thirty-three known travellers. The whole journey to the top and back can now be accomplished in 50 or 30 hours; but in general the view can hardly be said to be worth the fatigue, the extreme height of the position, even when the outlook is unclouded, rendering the prospect indistinct. For authorities and maps, see ALPS, vol. i. pp. 635-6.

**BLANE, SIR GILBERT**, a distinguished physician, was born at Blanefield in Ayrshire, in 1749, and died in London in 1834. He was educated at Edinburgh University, and shortly after his removal to London became private physician to Lord Rodney, whom he accompanied to the West Indies. Through his skill and exertions the health of the seamen on board the fleet remained comparatively unaffected by the climate; and on his return home he embodied the results of his experience in a treatise *On the Diseases of Seamen*, 1783. He rose rapidly to fame, acquired an extensive practice, and in 1812 was appointed physician in ordinary to the Prince of Wales, with the rank of baronet. When at the head of the Navy Board of Health, an office he held for some years, he introduced many useful measures for securing the health of seamen during long voyages. Of his numerous works the most important is the *Elements of Medical Logic*, 1819.

**BLANES**, a city of the province of Gerona in Spain, at the mouth of the River Tordera, defended by a castle. The population, 5990 in number, are principally employed in the fisheries and navigation. Lace is manufactured by the women. Long.  $2^{\circ} 51'$  E, lat.  $41^{\circ} 42'$  N.

**BLARNEY**, a small village of Ireland, in the county of Cork, about 5 miles from that city, chiefly celebrated as giving name to a peculiar kind of eloquence, alleged to be characteristic of the natives of Ireland. The "Blarney Stone," the kissing of which is said to confer this faculty, is pointed out within the castle.

**BLASPHEMY** means literally defamation or evil speaking, but is more peculiarly restricted to an indignity offered to the Deity by words or writing. The common law of England treats blasphemy as an indictable offence. All blasphemies against God, as denying his being, or providence, all contumelious reproaches of Jesus Christ, all profane scoffing at the Holy Scriptures, or exposing any part thereof to contempt or ridicule, are punishable by the temporal courts with fine, imprisonment, and also infamous corporal punishment. The Act 1 Eliz. VI. c. 1 (repealed 1 Mary, c. 2, and revived 1 Eliz. c. 1), enacts that persons receiving the sacrament of the Lord's supper, by contemptuous

words or otherwise, shall suffer imprisonment. Persons denying the Trinity were deprived of the benefit of the Act of Toleration by 1 Will. III. c. 18. The 9 and 10 Will. III. c. 32, enacts that if any person, educated in or having made profession of the Christian religion, should by writing, preaching, teaching, or advised speaking, deny any one of the persons of the Holy Trinity to be God, or should assert or maintain that there are more gods than one, or should deny the Christian religion to be true, or the Holy Scriptures to be of divine authority, he should, upon the first offence, be rendered incapable of holding any office or place of trust, and for the second incapable of bringing any action, of being guardian or executor, or of taking a legacy or deed of gift, and should suffer three years' imprisonment without bail. It has been held that a person offending under the statute is also indictable at common law (*Rex v. Carlisle*, where Mr Justice Best remarks, "In the age of toleration, when that statute passed, neither churchmen nor sectarians wished to protect in their infidelity those who disbelieved the Holy Scriptures.") The 53 Geo. III. c. 160, excepts from these enactments "persons denying as therein mentioned respecting the Holy Trinity," but otherwise the common and statute law on the subject remains as stated. In the case of *Rex v. Woolston* (2 Geo. II.) the court declared that they would not suffer it to be debated whether to write against Christianity in general was not an offence punishable in the temporal courts at common law, but they did not intend to include disputes between learned men on particular controverted points. The law against blasphemy has not recently been in active operation. In 1841, Moxon was found guilty of the publication of a blasphemous libel (*Shelley's Queen Mab*), the prosecution having been instituted by Hetherington, who had previously been condemned to four months' imprisonment for a similar offence, and wished to test the law under which he was punished. In the case of *Cowan v. Milbourn*, in 1867, the defendant had broken his contract to let a lecture-room to the plaintiff, on discovering that the intended lectures were to maintain that "the character of Christ is defective, and his teaching misleading, and that the Bible is no more inspired than any other book," and the Court of Exchequer held that the publication of such doctrine was blasphemy, and the contract therefore illegal. On that occasion the court reaffirmed the dictum of C. J. Hale, that Christianity is part of the laws of England. The Commissioners on Criminal Law (sixth report) remark, that "although the law forbids all denial of the being and providence of God or the Christian religion, it is only when irreligion assumes the form of an insult to God and man that the interference of the criminal law has taken place."

Profane cursing and swearing is made punishable by 19 Geo. II. c. 21, which directs the offender to be brought before a justice of the peace, and fined 5 shillings, 2 shillings, or 1 shilling, according as he is a gentleman, below the rank of gentleman, or a common labourer, soldier, &c.

By the law of Scotland, as it originally stood, the punishment of blasphemy was death. By an Act passed in the first parliament of Charles II., whoever, "not being distracted in his wits," should curse God or any person of the blessed Trinity was punishable with death; and by a statute of King William's reign (1695, c. 11), any person reasoning against the being of God, or any person of the Trinity, or the authority of the Holy Scriptures, or the providence of God in the government of the world, was to be imprisoned for the first offence until he should give public satisfaction in sackcloth to the congregation, to be punished more severely for the second offence, and for the third doomed to death, but by 6 Geo. IV. c. 47, amended by 7 Will. IV. and 1 Vict. c. 5, blasphemy was made punishable by fine or imprisonment or both. (E. R.)

BLASTING is the process by which portions of rock, or other hard substances, are disintegrated by means of an explosive agent, such as gunpowder. It is largely resorted to in quarrying, tunnelling, and mining operations.

Of late years there has been rapid advance in the art, through the discovery of new explosives, through improvements in appliances for firing, &c.; so that the older method of blasting has, in many instances, given place to a more complex system, with which much better results are obtained. The simpler process may be described thus. When a blast is to be made, a hole to receive powder is first bored in the rock; such holes vary in diameter from  $\frac{1}{2}$  inch to  $2\frac{1}{2}$  inches, in depth from a few inches to many feet, and in direction from the vertical to the horizontal. The borer, or jumper, with which the hole is made is a steel pointed drill; it is struck by a hammer, and is turned partly round after each blow, to make the hole cylindrical. One man may do all this alone, but generally, in the case of larger holes, a man, in sitting posture, directs the jumper, supplies the hole with water, and clears out the powdered stone at intervals with a scraper, while another man, or two, or three, are engaged in striking. A small rope of straw or hemp is twisted round the jumper at the orifice of the hole to prevent squirting up of the water. In the case of soft rock a loaded drill is sometimes used, which acts merely by its own weight. On the other hand, in substances like pyrites, or compact magnetic iron ore, which cannot be penetrated with steel drills, holes for blasting may be made by the gradual action of an acid (commonly muriatic) admitted through a vertical glass tube. When a sufficient depth is reached, the hole is cleaned and dried, and a charge of powder put in. A small taper rod of copper, the needle or nail, is inserted so as to reach to the bottom of the charge; then the rest of the hole is filled up with some such material as dry sand or tough clay, which forms the "tamping" or wadding, and which is firmly rammed down in small quantities successively by means of the tamping bar, a copper-faced punch of such thickness that it nearly fills the hole, and having a groove in it to receive the nail. This operation requires great care, because of the danger of eliciting sparks through collision. The hole being now fully charged, the nail is withdrawn, leaving a small vent hole, into which is then introduced an oaten straw filled with powder (or a series of such). To this is attached a slow match of paper steeped in saltpetre. The match is touched with fire; the alarm is given to retire to a safe distance; and presently the explosion takes place, the rock opening with a sharp report, and fragments of stone being often shot into the air in all directions. An improvement on this method of firing consists in the employment of Bickford's patent fuse, which may be described as a perforated rope or hose containing an inflammable composition. A suitable length of fuse is placed in contact with the charge before tamping, and carried up to the mouth of the hole. On being lighted it burns at the rate of 2 to 3 feet per minute, giving the miners an opportunity to escape before explosion. A water-tight form of the fuse is often used in submarine blasting,—the shot or charge being then made up in cartridge form.

Blasting, however, is often done on a much larger scale than that just indicated. As an example of the large blasts, or "mines," where great blocks of rock have to be removed at once, we might take some of the operations carried on at the Holyhead quarries a number of years ago for the harbour works. An entrance gallery, 5 feet 6 inches by 3 feet 6 inches was first driven from the face of the rock (hard quartzose schist), an extent of 34 feet, where a shaft, 3 feet 6 inches by 3 feet 6 inches, was sunk to a depth of 14 feet. From this level galleries were

driven some distance right and left, with four short headings, at intervals, returning towards the face of the rock and terminating in chambers for the charges. The four charges, amounting in all to 12,000 lb of powder, were enclosed in canvas bags coated with tar. They were calculated at the rate of 1 lb of powder to 3 tons of rock. For tamping a stiff red clay was used; it was well rammed up close to the bags of powder (leaving a small air space round these), and continued to the mouth of the gallery. The charges were fired simultaneously by means of platinum wire heated by a Grove's battery. The total quantity of rock removed was about 40,000 tons; it was separated into various sized blocks. Similarly, the Rounddown Cliff at Dover was overthrown in 1843 for railway purposes by 18,500 lb of powder, in three separate charges, fired simultaneously from a Voltaic battery; a saving of £7000 was thus effected by the South-Eastern Railway Company.

In reviewing recent developments of the art of blasting, the application of machinery in the boring of rocks naturally claims some attention. A good rock-boring machine, at least where used in connection with simultaneous firing by electricity, ensures considerable economy in time and labour over the old method of hand-boring. Of such machines, in which the jumper is repeatedly driven against the rock by compressed air or steam, being also made to rotate slightly at each blow, there are several varieties; the Burleigh rock drill is one of the best. It was used in the Hoosac tunnel in Massachusetts from 1869; and the last 5220 yards were completed with only eight of these machines. The rock was gneiss alternating with quartz. With hand-boring, the progress per minute was about 16 yards; with the Burleigh drill it was 48 yards, and the work was about one-third cheaper. According to *Engineering*, the cost of the Mont Cenis tunnel was £195 per linear yard; that of the Hoosac tunnel, notwithstanding much harder rock, only £180. In the recent large blastings at Hellgate, New York, the Burleigh machines also established their superiority, and came to be used exclusively. Among other boring-machines may be mentioned the "Diamond" drill, and the systems of Law, Ingersoll, McKean, Bergstroem, Sachs, Doering.

The general properties of ordinary blasting-powder are well known; it requires to be kept dry, and when dry, a spark of fire will cause it to explode. Various efforts have of late years been made towards the employment of more powerful explosive agents for blasting purposes. The violent oxidizing power of chlorate of potash marked it out as available for explosive mixtures; and sundry preparations containing this substance have been made (some of them highly dangerous). *Horsley's Blasting-Powder*, consisting of powdered nut galls and chlorate, may be taken as a type of these mixtures, and as the safest of them. It is both more violent and more rapid in explosion than ordinary blasting-powder, and does not give off any smoke or unpleasant smell when it explodes. It must be kept dry, and it is liable to explode through friction; the expensiveness of its ingredients is also a drawback. *Gun-cotton* was discovered by Schönbein in 1846, but owing to disastrous accidents occurring in the three years which followed, it was abandoned in this country and in France for sixteen years. Through the researches, meanwhile, of an Austrian, Baron von Lenk, it again came into notice in 1864, and a Government committee investigated the merits of the gun-cotton twist or rope made according to the Austrian system. For blasting hard rock its general superiority in effect to powder was recognized; and the absence of smoke, where the resistance opposed to the gun-cotton was sufficient to develop its full explosive force, was specially remarked upon. The want of rigidity of the material was objectionable; and several accidents

occurred, through violent friction of the twist, when miners had attempted to drive home a jammed charge. A considerable gain was secured by the invention of *compressed gun-cotton* by Professor Abel in 1868. In this form the explosive occupied less than half the space of the rope charges, and the smooth, hard exterior of the cylindrical charges rendered the operation of loading comparatively easy. The compressed charges, moreover, did not burn with the explosive violence of spun gun-cotton even when confined in the ordinary packing cases. Among further improvements may be noted the cheapening of the material by use of cotton waste, instead of the long staple cotton of high quality that was used in the Austrian manufacture. In 1868 Mr E. O. Brown discovered that (like nitroglycerine)<sup>1</sup> compressed gun-cotton was susceptible of violent explosion through the agency of a detonation, as well as in the ordinary way. This was important, especially for submarine operations and works of demolition, for the strong confinement which was always necessary in the other case could be dispensed with; indeed, with some waste of power, the substance might be exploded completely unconfined. Gun-cotton is not affected in its explosiveness by cold; and it can be kept any length of time without deterioration in the damp and perfectly unignitable state. The formula that has been assigned for the most explosive gun-cotton is  $C_{10}H_7N_3O_{11}$ .

In 1864 Mr Nobel's researches called attention to the application of *nitroglycerine* (discovered by Sö. zero in 1846) as an explosive agent. He first showed that the effect of gunpowder was considerably increased through impregnation with it; and later, that the liquid itself, which burns slowly in the air on application of a flame with a common tuse, could be exploded by an initiative detonation,—confinement by tamping being then unnecessary. In its pure state it was soon proved to be the most powerful explosive yet known; its destructive force is about ten times that of gunpowder. Its liquid form, high specific gravity, and insolubility in water, are valuable properties in some cases, as in blasting under water or in wet holes. It freezes at a comparatively high temperature ( $40^\circ$  Fahr.); but the opinion, formed from several grave accidents, that it was more susceptible of detonation in the frozen than in the liquid state, has been shown to be contrary to fact. When frozen it is more liable to recklessly rough usage. The liquid state of nitroglycerine, on the other hand, constitutes a very serious defect, owing to its tendency to leak from vessels in which it is carried, or from the blast-hole, through fissures in the rock,—resulting in unexpected explosions, it may be, through some slight concussion. Mr Nobel's ingenious device for rendering nitroglycerine temporarily inexplusive, by dissolving it, viz., in wood spirit, is only partially successful. Nitroglycerine has been extensively used in various mining districts, especially in California. After some terrible accidents, which occurred in 1866-7, its use in England was placed under severe restrictions.

Impressed with the serious disadvantages of this explosive, Mr Nobel was led to the important observation that its readiness to explode by detonation is not diminished, but rather favoured, by mixture with solid substances, in themselves quite inert; and the dilution did not materially detract from the great superiority of nitroglycerine over gunpowder. In 1867 he brought before the public the substance appropriately called *dynamite*, which is one of the safest, most powerful, and most convenient explosives for industrial purposes. It consisted of seventy-five parts of nitroglycerine held absorbed by twenty-five

parts of a porous, infusorial, silicious earth, known in Germany as "Kieselguhr." Other absorbents have been employed (precipitated kaolin, tripoli, precipitated alumina, sugar, &c.), but none of them are equal to kieselguhr in power of retaining oil. Dynamite is furnished to the trade in the form of small cylindrical cartridges, in which the material, consolidated by pressure, is enclosed in a single wrapping of parchment paper. It requires no tamping, and can be exploded by detonation under water. It is slow to catch fire, but burns rather fiercely when fired; and if the quantities are large, or under confinement, an explosion may finally ensue. The trade in it has developed rapidly; thus, while only 11 tons of it were sold in 1867, the quantity rose to 3120 tons in 1874.

In the preparation known as *lithofracteur*, which came into notice during the Franco-German War, nitroglycerine is used in considerably smaller proportions than in dynamite; and the kieselguhr of the latter is partly replaced by materials forming of themselves a feebly explosive mixture. Its properties are very similar to those of dynamite, but it is less powerful.

The less known ammonia powder, invented by Ohlson and Norbin, is much stronger than lithofracteur, and even surpasses dynamite. Its only drawback is the hygroscopic nature of its chief ingredient, which is nitrate of ammonium; but otherwise it is a very superior blasting agent. Numerous other explosives have been tried in blasting, but those we have named are amongst the most important.

In a recent paper to the Society of Arts, Mr Nobel has discussed the relative power of several blasting agents. He finds that when their ballistic power is compared bulk for bulk, the substances experimented with rank as follows:—Nitroglycerine, 100; ammonia powder, 80; dynamite (No. 1), 74; lithofracteur, 53; gun-cotton, 45; Curtis and Harrey's blasting-powder (fired by detonator), 17.5. While these figures show the great superiority of nitroglycerine, there are practical circumstances which bring it and dynamite nearly on an equality. Thus, to get the full benefit of a blast there should be no air-space round the charge. Now, from the danger (as we have seen) of nitroglycerine leaking through imperceptible fissures in a rock, rigid cartridges are required for it, and these always involve a considerable air chamber, whereas dynamite, being highly plastic, can be easily compressed so as to exclude all empty space. The cartridges of compressed gun-cotton are also liable, of course, to the objection just noticed.

Where rapid destruction is to be accomplished there is a saving of labour, of tools, and of time by use of the new explosive agents (such as dynamite or gun-cotton). Their shattering and splitting effect in hard rock is much greater, but in quarrying, the rock is generally not thrown out by them to the same extent. Where a moderate cleaving or splitting effect is desired, with as little local action as possible, gunpowder is best, as in raising large blocks of slate, also where great displacing action is required. In submarine blasting of soft rocks the violent explosives disintegrate the rock into a plastic mass within a limited area, but do not shatter or rend it to any great distance.

As regards comparative safety, there is no doubt that modern explosives offer a relative immunity from the danger arising from fire, to which gunpowder is subject. Neither dynamite nor gun-cotton can be fired by a spark, and if accidentally fired by a flame, they allow reasonable chances of escape. On the other hand, accidents have often happened in the thawing of nitroglycerine preparations when frozen,—a process that requires great care, and for which suitable warming pans are provided. But miners are slow to understand that a cartridge which firing does not set off cannot be slowly heated with the same impunity; hence they will roast the preparations near a

<sup>1</sup> It was found, in the course of these inquiries, that all explosive compounds, even including gunpowder, are susceptible of explosion through a detonation, though the nature and force of the detonation vary considerably with different explosive substances.

fire, or on hot cinders, or in other ways really dangerous. Gun-cotton and dynamite prove much safer than nitroglycerine as regards exploding through concussion. There is not, however (Mr Nobel thinks), that amount of difference, between the sensitiveness of nitroglycerine and dynamite which the latter substance generally receives credit for. The main danger of nitroglycerine arose from the sensitiveness to concussion which it acquired through contact with a hard, metallic, strongly vibrating substance, such as the tin canisters in which it was contained. The main safety of dynamite is derived from the absence of any hard vibrating material in immediate contact with the nitroglycerine it contains.

As regards danger from concussion in manufacture and transit, gun-cotton ranks first; but in the hands of miners, the case is reversed, through the rough usage of gun-cotton charges, where, *e.g.*, they are found too large for a bore-hole, for gun-cotton is well known to explode with a blow. The danger most dreaded in modern explosives is from their supposed liability to chemical decomposition productive of heat, which sometimes leads to ignition and explosion. This decomposition is generally due to the presence of acid (chiefly nitric and hyponitric), which every nitrated compound has a strong tendency to retain. From the ease with which the acid can be washed out from nitroglycerine, both it and dynamite show much greater chemical stability than gun-cotton. \*Most cases of spontaneous combustion of the latter have probably arisen either from imperfect washing, or from drying at too high a temperature (by which hyponitric acid is set free).

Complaints have often been made of the poisonous fumes given off by the new explosives. Where this occurs, it is probably due to an injudicious use of the substance, resulting in imperfect explosion. If a dynamite cartridge partly burns instead of exploding, the temperature is much lower, and fumes of hyponitric acid are given off, which could not escape decomposition at the higher temperature of perfect explosion. The general mistake consists in not securing carefully the detonator cap to the fuse, and especially the fuse to the cartridge.

*Blasting by Electricity.*—It is known that electricity has a thermal effect on wire through which it passes; and the amount of heat produced in any part of the circuit is proportional to the resistance in that part. Thus a piece of wire of small section and conductivity may be made incandescent by a current. On this principle platinum is sometimes employed to fire blasting charges. In making a fuse of this sort, two insulated copper wires are twisted together for a length of about 6 inches, leaving the extremities free for about half an inch, and separated the same distance. A fine platinum (or iron) wire is stretched across this interval, metallic contact being established with the copper. The other ends of the fuse are connected with a battery. Platinum fuses are not much to be relied on for simultaneous blasting of several charges by one battery; for some of the fuses may take a little more time to reach the exploding temperature than others, and thus, as soon as one explodes, the connection between the others and the battery is broken. The batteries to be used with them are such as generate electricity of great quantity. The Bunsen and Leclanché batteries, in some of their varieties, are well suited for this. Twelve cells of Highton's battery will melt a piece of platinum wire over an inch long.

There is, however, another class of fuses, offering certain advantages over those just referred to, in which the spark produced by electricity of tension is the means used to effect the explosion. It might naturally be thought that an electric spark must inevitably cause explosion in a mass of powder or like substance through which it is made to pass, but this is not the case. The heating

power of the spark is often insufficient for explosion. The duration of an induction spark is about the *millionth* of a second; whereas, to ignite powder, it is necessary that a spark should exist for at least the *three hundredth* part of a second. By interposing, however, a suitable priming composition in the interval which the spark is to cross, and in contact with the charge, explosion may be thus effected. In preparing such a composition, the properties of the ingredients as regards conductivity, inflammability, and explosiveness have to be nicely adjusted, according to the degree of tension of the electricity employed. The composition selected by Professor Abel for his fuses is an intimate mixture of subsulphide of copper, subphosphide of copper, and chlorate of potassium. It is a mixture which conducts, but conducts with difficulty, and the fuses made with it are very effective. There are several other varieties, *e.g.*, Ebner's fuse, where the priming consists of a mixture of sulphuret of antimony, chlorate of potash, and graphite.<sup>1</sup>

For generating electricity of tension with the Voltaic battery, Leclanché's battery is, again, one of the most suitable. The elements of this battery consist of a rod of carbon placed in a porous cell and tightly packed round with a mixture of peroxide of manganese and coke; the porous cell is placed in a vessel containing a plate of zinc, which forms the electro positive element, and a solution of sal-ammoniac is used as the exciting liquid. There are some forms of battery for the same purpose so arranged that the contact of the elements with the liquid takes place only at the time of firing; such are those of Wollaston, Ruhmkorff, and Trouvé.

Frictional electricity is the kind generally adopted by military authorities in firing charges,—the machines for generating it being easily made, simple, portable, and powerful. Bornhardt's frictional machine has found extensive use in Austria in ordinary blasting operations. It is contained in a small metallic case, and consists of a disc of ebonite, which can be rotated between two cushions, charging a small Leyden jar placed near it. On pressing a little button from the outside, connection is made between the two coatings of the jar in such a way that the charge is sent through two wires by which the box is connected with the fuse, or fuses, at a distance. Some absorbent of moisture is kept within the box, and it is necessary to see that the machine be kept as warm and dry as possible.

Experiments were made by Messrs Wheatstone and Abel a number of years ago, with Armstrong's hydroelectric machine, as a source of electricity for exploding charges of powder. They state that in very extensive mining operations, where a great many charges have to be fired simultaneously, and provided all the necessary appliances for success are at hand, this machine could be used very effectively. It is a powerful source of electricity of high tension. There are serious objections, however, to its general use.

Electro-magnetic induction currents (such as are developed in Ruhmkorff's coil) were first applied, and successfully, by Colonel Verdu, a Spanish officer, in 1853. The induction discharge, unlike that of a Leyden battery, is much enfeebled by successive solutions of continuity, so that not more than four mines in a single circuit could certainly be exploded on this system. But M. Savare made an improvement by interposing the fuses in branches of the principal circuit. The mine nearest the apparatus explodes first; and, owing to the abrupt separation of the wires, the current can no longer pass through this branch, thus the electric action is augmented in the other branches, and in a similar manner the explosions necessarily take

<sup>1</sup> In one form of fuse employed with dynamite, there is connected with the priming just mentioned some mercuric fulminate and loose gun-cotton.

place in them, and that with a rapidity almost instantaneous. This is also a more efficient plan than that of employing a rheotome for changing the direction of the current, so as to bring wires connected with one or more charges successively into the circuit. The Ruhmkorff coil is, however, objectionable for its delicacy and the maintenance of batteries in connection with it. In experiments made by Messrs Wheatstone and Abel, a powerful magneto-electric machine was found very limited in its power of igniting several charges arranged in succession in one circuit (it only ignited three at most, with certainty); but on M. Savare's plan of arranging the charges in divided circuits, the simultaneous ignition of twenty-five charges was repeatedly effected; on several occasions as many as forty. By this plan each charge was connected with a separate branch attached to the main line, and their connection with earth established by means of uncovered copper wire wound round an iron stake driven in the ground. Another form of instrument, devised by Wheatstone, consists of six small magnets, to the poles of which are fixed soft iron bars surrounded by coils of insulated wire; the coils of all the magnets are united together, so as to form, with the external conducting wire and the earth, a single circuit. An axis carries six soft iron armatures, in succession, before each of the coils. With this apparatus twenty-five charges were frequently fired in divided circuit, so rapidly that the effect on the ear was as of one explosion, only of slightly longer duration than when the large magnet was employed. The Markus apparatus, largely used in Germany, is on the same principle.

Siemens's dynamo-electric machine, in which electro-magnets are employed, is a very useful machine for simultaneous firing. It is found that the residual

magnetism left in the coils of electro-magnets, after a current from even a single Voltaic cell has been once sent through them, is always sufficient to have the necessary inductive action on the armature. This inductive action, though very weak at first, generates slight alternating currents in the armature, which are by means of a commutator caused to flow always in one direction through the coils of the electro-magnet, thus increasing the magnetism in the core, which, in its turn, increases the inductive action, causing stronger and stronger currents to be generated in the armature. This action and reaction goes on till the limit of magnetic capacity of the core is reached, and if the coil of the armature be then suddenly connected with the line leading to a fuse, a very powerful current is transmitted. In Breguet's exploder (in which a bar of soft iron is suddenly separated from the armature of a magnet bearing two induction coils) a special arrangement gives rise to an extra-current, and considerably increases the intensity of the current. M. Breguet has lately utilized in this apparatus the new and powerful laminated magnets constructed by M. Jamin. Gramme's machines are also effective in exploding charges, but their volume and high price are against a large use of them industrially.

For more detailed information on the recent developments of blasting, reference may be made to Spou's *Dictionary of Engineering*, art. "Boring and Blasting;" *Professional Papers of the Corps of Royal Engineers*, vols. vii., x., xxii.; *Transactions of the Society of Engineers*, 1869 and 1871; *Proceedings of South Wales Institute of Mining Engineers*, vol. viii., No. 5, vol. ix., Nos. 1 and 2; Dingle's *Polytechnisches Journal*, Oct. 1, 1874; *Annales de Chimie et de Physique*, May 1875; *Journal of the Society of Arts*, May 28, 1875. ## BLEACHING

**BLEACHING** is the process of whitening or depriving objects of colour, an operation incessantly in activity in nature by the influence of light, air, and moisture. The art of bleaching, of which we have here to treat, consists in inducing the rapid operation of whitening agencies, and as an industry it is mostly directed to cotton, linen, silk, wool, and other textile fibres, but it is also applied to the whitening of paper-pulp, bees'-wax, and some oils and other substances. The term bleaching is derived from the Anglo-Saxon *bleacan* to bleach, or to fade, from which also comes the cognate German word *bleichen*, to whiten or render pale. Bleachers, down to the end of last century, were known in England as "whitsters," a name obviously derived from the nature of their calling.

The operation of bleaching must from its very nature be of the same antiquity as the work of washing textures of linen, cotton, or other vegetable fibres. Clothing repeatedly washed, and exposed in the open air to dry, gradually assumes a whiter and whiter hue, and our ancestors cannot have failed to notice and take advantage of this fact. Scarcely anything is known with certainty of the art of bleaching as practised by the nations of antiquity. Egypt in early ages was the great centre of textile manufactures, and her white and coloured linens were in high repute among contemporary nations. As a uniformly well bleached basis is necessary for the production of a satisfactory dye on cloth, it may be assumed that the Egyptians were fairly proficient in bleaching, and that still more so were the Phœnicians with their brilliant and famous purple dyes. We learn, from Pliny, that different plants, and likewise the ashes of plants, which no doubt contained alkali, were employed as detergents. He mentions particularly the *Struthium* as much used for bleaching

in Greece, a plant which has been identified by some with *Gypsophila Struthium*. But as it does not appear from Sibthorp's *Flora Græca*, published by Sir James Smith, that this species is a native of Greece, Dr Sibthorp's conjecture that the *Struthium* of the ancients was the *Saponaria officinalis*, a plant common in Greece, is certainly more probable.

In modern times, down to the middle of the 18th century, the Dutch possessed almost a monopoly of the bleaching trade, although we find mention of bleach-works at Southwark near London as early as the middle of the 17th century. It was customary to send all the brown linen, then largely manufactured in Scotland, to Holland to be bleached. It was sent away in the month of March, and not returned till the end of October, being thus out of the hands of the merchant more than half a year.

The Dutch mode of bleaching, which was mostly conducted in the neighbourhood of Haarlem, was to steep the linen first in a waste lye, and then for about a week in a potash lye poured over it boiling hot. The cloth being taken out of this lye, and washed, was next put into wooden vessels containing butter-milk, in which it lay under a pressure for five or six days. After this it was spread upon the grass, and kept wet for several months, exposed to the sunshine of summer.

In 1728 James Adair from Belfast proposed to the Scotch Board of Manufactures to establish a bleachfield in Galloway; this proposal the board approved of, and in the same year resolved to devote £2000 as premiums for the establishment of bleachfields throughout the country. In 1732 a method of bleaching with kelp, introduced by R. Holden, also from Ireland, was submitted to the board; and with their assistance Holden established a bleachfield for prosecuting his process at Pitkerro, near Dundee.

The bleaching process, as at that time performed, was very tedious, occupying a complete summer. It consisted in steeping the cloth in alkaline lyes for several days, washing it clean, and spreading it upon the grass for some weeks. The steeping in alkaline lyes, called *bucking*, and the bleaching on the grass called *crofting*, were repeated alternately for five or six times. The cloth was then steeped for some days in sour milk, washed clean, and crofted. These processes were repeated, diminishing every time the strength of the alkaline lye, till the linen had acquired the requisite whiteness.

For the first improvement in this tedious process, which was faithfully copied from the Dutch bleachfields, manufacturers were indebted to Dr Francis Home of Edinburgh, to whom the Board of Trustees paid £100 for his experiments in bleaching. He proposed to substitute water acidulated with sulphuric acid for the sour milk previously employed, a suggestion made in consequence of the new mode of preparing sulphuric acid, contrived some time before by Dr Roebuck, which reduced the price of that acid to less than one-third of what it had formerly been. When this change was first adopted by the bleachers, there was the same outcry against its corrosive effects as arose when chlorine was substituted for crofting. A great advantage was found to result from the use of sulphuric acid, which was that a souring with sulphuric acid required at the longest only twenty-four hours, and often not more than twelve; whereas, when sour milk was employed, six weeks, or even two months, were requisite, according to the state of the weather. In consequence of this improvement, the process of bleaching was shortened from eight months to four, which enabled the merchant to dispose of his goods so much the sooner, and consequently to trade with less capital.

No further modification of consequence was introduced in the art till the year 1787, when a most important change was initiated by the use of chlorine, an element which had been discovered by Scheele in Sweden about thirteen years before. Berthollet repeated the experiments of Scheele in 1785, and by the prosecution of further investigations he added considerably to the facts already known. He showed that this substance (called by Scheele *dephlogisticated muriatic acid*) is a gas soluble in water, to which it gives a yellowish green colour, an astringent taste, and the peculiar smell by which the body is distinguished.

The property which this gas possesses of destroying vegetable colours, led Berthollet to suspect that it might be introduced with advantage into the art of bleaching, and that it would enable practical bleachers greatly to shorten their processes. In a paper on dephlogisticated muriatic acid, read before the Academy of Sciences at Paris in April 1785, and published in the *Journal de Physique* for May of the same year (vol. xxvi. p. 325), he mentions that he had tried the effect of the gas in bleaching cloth, and found that it answered perfectly. This idea is still further developed in a paper on the same substance, published in the *Journal de Physique* for 1786. In 1786 he exhibited the experiment to Mr James Watt, who, immediately upon his return to England, commenced a practical examination of the subject and was accordingly the person who first introduced the new method of bleaching into Great Britain. We find from Mr Watt's own testimony that chlorine was practically employed in the bleachfield of his father-in-law, Mr Macgregor, in the neighbourhood of Glasgow in March 1787. Shortly thereafter the method was introduced at Aberdeen by Messrs Gordon, Barron, and Co., on information received from M. de Saussure through Professor Copland of Aberdeen. Mr Thomas Henry of Manchester was the first to bleach with chlorine in the Lancashire district, and to his independent investigations several of the

early improvements in the application of the material were due.

No very great amount of success, however, attended the efforts to utilize chlorine in bleaching operations till the subject was taken up by Mr Tennant of Glasgow. He, after a great deal of most laborious and acute investigation, hit upon a method of making a saturated liquid of chloride of lime, which was found to answer perfectly all the purposes of the bleacher. This was certainly a most important improvement, without which, the prodigious extent of business carried on by some bleachers could not possibly have been transacted. Such was the acceleration of processes effected by the new method that, it is stated, a bleacher in Lancashire received 1400 pieces of gray muslin on a Tuesday, which on the Thursday immediately following were returned bleached to the manufacturers, at the distance of sixteen miles, and were packed up and sent off on that very day to a foreign market.

In the year 1798 Mr Tennant took out a patent for his new invention, and offered the use of it to practical bleachers, for a fair and reasonable portion of the savings made by its substitution for potash, then in general use. Many of the bleachers, however, used it without paying him, and a combination was formed to resist the right of the patentee. In December 1802, an action for damages was brought against Messrs Slater and Varley, nominally the defendants, but who, in fact were backed and supported by a combination of almost all the bleachers in Lancashire. In consequence of this action, the patent right was set aside by the verdict of a jury and the decision of Lord Ellenborough, who used very strong language against the patentee. The grounds of this decision were, that the patent included a mode of *bucking* with quicklime and water, which was not a new invention. It was decided that, because one part of the patent was not new, therefore the whole must be set aside. Lime was indeed used previous to the patent of Mr Tennant, but it was employed in a quite different manner from his, and he would have allowed the bleachers to continue their peculiar method without any objection, because it would have been productive of no injury to his emolument.

In consequence of this decision the use of liquid chloride of lime in bleaching was thrown open to all, and speedily came to be universally employed by the bleachers in Britain. Mr Tennant, thus deprived of the fruits of several years of anxious and laborious investigation, advanced a step farther, to what may be considered as the completion of the new method. This consisted in impregnating quicklime in a dry state with chlorine, an idea originally suggested by Mr Charles McIntosh of Cross Basket, then a partner with Messrs Tennant and Knox. A patent for this was taken out on the 13th of April 1799, and he began his manufacture of solid chloride of lime at first upon a small scale, which has ever since been gradually extending, and the manufactory is now the largest of the kind in Great Britain.

The various processes for the preparation of the so-called chloride of lime, or bleaching-powder, as conducted at the present day, and its other applications in arts, will be found described under the head of CHLORINE.

#### BLEACHING OF COTTON

Of the two great staples, cotton and linen, to the whitening of which the art of the bleacher is directed, cotton is the more easily and expeditiously bleached. The basis of all vegetable fibres is cellulose or ligneous tissue, a pure white substance, and it is to obtain this body in a state of purity, free from the resinous matter naturally associated with it as well as from adventitious impurities

imparted in the process of spinning and weaving, that is the object of bleaching. The operations, although apparently complex and numerous, are essentially simple, though frequently repeated, and the greatest variety of detail is connected with the finishing of cloth, which is in reality a separate industry, frequently conducted in distinct establishments under the name of calendering and finishing works. Bleaching proper resolves itself into washing with suitable detergents, and subjecting the washed material to the influence of chlorine, whereby the colouring matter either belonging to the fibre or imparted to it is oxidized and discharged.

The general arrangements of a bleach-house will be made plain from the ground-plan (fig. 1). The various pieces

FIG. 1.—Ground-Plan of Bleach-House

of apparatus, the positions of which are there indicated, will be described in connection with the sequence of operations through which the cloth passes in the process of bleaching. In the best arranged works, it should be mentioned, where power is required to work any machine, it is generally supplied by a separate engine attached to the machine itself, instead of by gearing carried from one engine for all the machinery. For this plan, as well as for the greater portion of the illustrations which follow, we are indebted to Mr William Mather, of the eminent firm of Mather and Platt, Salford, to whom we are also under obligation for much valuable practical information. We have also to express our indebtedness to Mr Alexander Crum of Thornliebank, for the fullest access to the important works of his firm, and for the cordial assistance afforded by the managers of its various departments.

The sequence of operations in the bleaching and finishing of calico has undergone no change in its general details since the bleaching-powder process was first introduced; but the mechanical arrangements by which the operations are conducted have been the subject of frequent improvements. The ingenuity of engineers and bleachers has been chiefly directed towards the decreasing of manual labour, economy of fuel and materials, and the rapid completion of the various processes. The application of factory legislation to bleach-works by the Bleaching and Dyeing Works Act of 1860, by imposing a necessity for regular and stated hours of work, still further stimulated the production of apparatus and arrangements for prompt and certain completion of the various operations. Consequently a great part of the old machinery and arrangements of a bleach-house have now disappeared, and the processes are carried on in a continuous series of operations by machinery and appliances to a large extent self-acting. Formerly each piece of goods was separately treated and carried by hand or on barrows from one stage to the next; now the pieces are sewn end to end, as many as 1000 pieces, measuring perhaps 20 miles, being operated on in one stretch.

As various pieces of old machinery are yet in use for certain kinds of work, it has been considered desirable to

give descriptions and figures of some of them, and these, at the same time, will serve the further purpose of indicating the nature of the mechanical improvements which have been carried out, in recent years, in bleaching establishments. The important and frequently repeated operation of washing was formerly conducted either at the wash-stocks or washing-mill or in the dash-wheel. The wash-stocks, which are yet in use in many large works, especially where linen is the bleacher's staple, consists of a trough or box for holding the goods to be washed, through which a constant stream of water is passing. A pair or more of heavy hammer-headed wooden beams, hung by long shafts, and playing into the trough, are alternately tilted against the cloth, causing the water by their momentum to work through and squirt out of the mass. This process of washing is rather tedious, occupying on an average about half an hour, and requiring besides a great amount of manual labour. The dash-wheel (fig. 2) is a cylindrical box revolving on its axis. It has four divisions, as shown by the dotted lines, and an opening into each division. A number of pieces are put into each, abundance of water is admitted behind, and the knocking of the pieces as they alternately dash from one side of the division to the other during the revolution of the wheel effects the washing. The process lasts from four to six minutes. The dash-wheel is used to the present day in the bleaching of curtain materials and fine muslins. In nothing have greater improvements been effected than in the arrangement of the kiers or vessels in which the cloth is boiled or "bowked." An old form of kier is seen in fig. 3. It consisted of a cylindrical vessel

FIG. 2.—Section of a Dash-Wheel.

AA, 9 feet wide, of wood or iron, having a false bottom BB, on which the goods were placed, about 6 inches from the real one. A small pipe E, in the centre of a wider one CC, conveyed the steam from the steam-boiler. When the liquid boiled at the bottom, where the steam issued, the steam forced its way up the pipe CC, carrying with it a quantity of the lye, which was thrown back by the small cover D, spreading itself over the surface of the goods, and filtering through them into the space below the false bottom, where it was again heated by the steam, reascended the pipe CC, and so on in constant succession, till the boiling was completed. FF is a wooden cover which prevented the cooling of the materials below a boiling heat.

FIG. 3.—Section of Kier (old form).

The bleaching of common calico is divided into two branches—1st, print bleaching, in the case of which the goods are bleached as a preliminary to the process of calico printing; and 2d, white bleaching, which applies to goods to be finished white or unprinted. The processes differ in some of their details, as in white bleaching it is only neces-

sary to

easy to satisfy the eye, whereas in print-bleaching the material must be rendered chemically pure, otherwise the colours in the subsequent printing process would be dull and blotchy. The print bleaching must therefore be more thoroughly done than the other; but as the processes are generally the same, it will be sufficient to indicate the points of difference in the various stages through which the material in both cases passes. A process preliminary to bleaching is

**Singeing.**—Gray calico as received from the looms is generally in lengths of  $37\frac{1}{2}$  and 50 yards. A large number of these, sometimes as many as 1000, measuring more than 20 miles in length, are sewn into a continuous web. At the extremities of each owner's lengths, the name of the firm, or some distinguishing mark, is either stamped on in tar, or marked by means of coloured threads. These long lengths are then submitted to the operation of singeing, which has for its object the removal of the downy pile and short threads from the surface of the cloth, which would interfere with the appearance of finished white goods, and with the uniformity and sharpness of patterns in the case of prints. Several methods of accomplishing this have been employed, but that most commonly used is the system of plate singeing illustrated in fig. 4. A pair of

FIG. 4.—Section of Singe Stove.

singe-plates, *a* and *b*, made of thick bent sheets of copper, are mounted over the flues of a fire sufficient to raise a white heat. The plate *b* is most highly heated, *a* being at the end of the flue furthest removed from the fire. The cloth enters over a rail *a*, and in passing over the plate *a* is thoroughly dried and prepared for the singeing it receives when it comes to the highly-heated plate *b*. A block *d*, carrying two rails in the space between the plates, can be raised or lowered at pleasure so as to increase or lessen the pressure of the cloth against the plates, or, if necessary, to lift it quite free of contact with them. The system of plate singeing is found generally sufficient in practice, but the caking of paste and dirt on the plates from the cloth as it passes over them, and variations in the heat of the plates, often lead to irregularities in singeing. A combination of plate and gas singeing is frequently employed to overcome the deficiencies of plate singeing alone. In this case the cloth is passed first over an ordinary plate, and then on to another, along the ridge of which is a long narrow slit, which allows the issue of a gas flame produced from coke burning immediately under it. By this means long loose threads are more effectually burned off than in plate singeing, and a more uniform heat is applied to the gray cloth. Fig. 5 is a sectional view of a very efficient singeing apparatus introduced by Messrs Mather and Platt. The figure represents the first half of the machine, the second portion being precisely similar in arrangement. The singeing in this case is accomplished by the burning of a mixture of coal-gas and atmospheric air admitted by a pipe

*a*, and driven by a fan *o*ast to the burners *b*, *b*, which are regulated by stop-cocks. The mixture burns with an

FIG. 5.—Gas Singeing Apparatus.

intense heat and a blue smokeless flame. The cloth is carried by a series of rollers to the gas jets, and in passing over the rollers *c*, *c*, *c*, the one side of the cloth impinges laterally four times against the flame, which is never permitted to pass through the fabric, but only shaves its surface. The back is thus singed in the first portion of the apparatus, and being turned over on roller *d* it is carried forward to another pair of jets, where, being thoroughly dry, the face side of the cloth is completely singed by going over exactly the same course through which the back is carried in the first part. By an arrangement not shown in the illustration, the attendant of the machine can instantaneously lower the gas burners by a treadle movement in case of any stoppage or accident, and thus prevent the cloth from being burned. With a proper pressure of gas this machine singes at the rate of 60 yards per minute.

At this stage the cloth has now in addition to the brown coloured incrusting substance and the resinous material proper to the fibre, a dark-coloured carbonized surface, caused by the singeing process, the weaver's paste or dressing, tallow or other fat introduced in the process of weaving, and the accumulation of dirt which the handling of weavers and others may have produced. The object of the subsequent processes is to wash out the mechanical impurities and resinous substances from the cloth, to render soluble by chemical agencies such as are otherwise insoluble in water, and to oxidize the colouring matter of the cotton by the chloride of lime as already explained.

**Liming.**—In some cases it is the practice immediately after singeing to steep the pieces in water and pile them up wet for a night, in order to loosen and partly ferment the weaver's paste, which is then in large part removed by washing in a machine to be subsequently described. The "gray-backs" which have been used in calico-printing have always to be thus steeped, and at one time it was the practice to leave the cloth so long in this steep that it acquired a most offensive odour. This preliminary steeping and washing facilitates the percolation of the liquor through the fabric in the process of boiling, but notwithstanding this advantage it is generally dispensed with, and the goods pass direct from the singeing to the liming process. The pieces are formed into a loose coil or rope by being passed through circular rings of glass or pottery called "pot-eyes," and worked up and down several times in a strong milk of lime, in order that the whole may be uniformly and thoroughly impregnated. The arrangement for liming will be understood from fig. 6, which is a sectional view of a "squeezer," an apparatus used repeatedly in subsequent operations as well as in this of liming. The cloth passes up and down as indicated by the arrows, dipping several times into the solution, and before passing finally on to the kiers for boiling it is slightly "nipped" between the

'bowls' of the squeezer to extract superfluous moisture. These bowls are thick cylinders of wood, usually in this case made of beech. From the lime squeezer the cloth is carried over winches, and guided through pot-eyes into the kiers.

FIG. 6—Section of Lime Squeezer.

**Bowling.**—A bowling kier is an apparatus in which the cloth is boiled. To one old form of kier allusion has already been made. Bowling is now mostly accomplished in closed kiers worked up to a considerable pressure of steam. In the boiling for white bleaching about 80 lb of lime are required for 2700 lb of cloth, and the boiling is continued for ten hours at a pressure of about 30 lb. A form of kier very generally employed consists of a strong vessel made of boiler plate, with a man-hole in the upper part, which can be screwed tightly down. The vessel is about 10 feet in depth, and 5 or 6 feet in diameter, and has a false bottom made of a grid of wood or iron, on which the lowest layer of cloth rests. Up the centre of the kier passes a pipe or tube which reaches higher than the cloth can be piled, and is surmounted by an umbrella-shaped plate. Steam is admitted at the lower part of the kier,

FIG. 7—Taylor's Circulating Kier

and as the pressure accumulates it gradually forces the liquor upwards through the central pipe till, by-and-by, it is dashed with great violence against the umbrella-shaped

plate, and thrown over the upper surface of the cloth. It gradually percolates down through the cloth to the bottom, where it is again caught and forced up through the central pipe, and thus a constant circulation is maintained. A very efficient circulating kier, the invention of Mr Taylor of Berchvaley, has recently been introduced, of which a sectional representation is given in fig. 7. This kier in outline is like the previous, but it has no central distributing pipe. Instead, the liquor is carried by an external pipe to the top of the kier, where it enters and is forcibly thrown against the surface of the cloth. The kier has a false bottom B as in the previous case, and when filled with cloth and liquor, the liquor percolates by a pipe C into the receiver D, where it finds its own level in the ascending pipe E. Steam is admitted at the lower part of the receiver by the steam-pipe F, and forces the liquor upwards through the pipe E to the top of the kier. The vacuum created in the receiver is supplied from the lower part of the kier, and the flow is facilitated by the pressure of steam from above, and thus a constant steady circulation is maintained. This kier is very useful in cases where a comparatively low pressure is desirable, as in white bleaching, where the coloured headings of the cloth (Turkey red or other coloured threads introduced at the end of a web) have to be preserved.

The bowking apparatus generally used by printers is Barlow's high-pressure kiers, an arrangement in which the kiers are worked in pairs. A pair is shown in fig. 8, one

FIG. 8—Barlow's High-Pressure Kiers

being seen in section, the dimensions of the vessels are inserted in the figure.

The novelty these kiers introduced when first brought out, was that in using steam of 40 lb instead of 5 lb, a greater economy of time and drugs would be effected. Their world-wide application has proved that the inventor's theory has found ample confirmation. The cloth is carried or rather drawn by winches, and dropped into the wrought iron boilers or kiers AA, through the man-holes in the top, two pieces in all cases running side by side. As the pieces are delivered continuously in the kiers, a lad in each spreads a pile of the cloth all round the kier, as equally as possible, so that, when full, the kier shall be packed uniformly to the top. This cloth rests on what is termed a false bottom, simply a grid or plate with holes in it, as shown at B. Upon the grid are generally placed a few smooth stones, through the spaces between which the liquor drains from the cloth.

Down the centre of the kier is a pipe C, perforated with holes, for the purpose of distributing the liquor freely into the mass of cloth. The kiers are connected by a pipe D, leading from the bottom of one to the top of the other, and vice versa. The steam is introduced, through the valves E.E. After the kiers are filled with cloth, each holding about 6000 lb, the man-hole lids are screwed down and all made steam tight. A little steam is then turned on to discharge the air from the cloth, which escapes through the pipes F.F. This steam, moreover, gradually warms the goods. The alkaline liquor or lime water, having been mixed to the proper strength,

is then let into the kier A, through the tap G, until the necessary quantity has been supplied, about 20 gallons of caustic soda at 70° Tw., and 400 lb lime for the full charge being used. The steam is then turned on slowly, and by its pressure the liquor in kier A is made to pass with great force through the cloth, and then up the pipe D, through the 3-way valve, into the kier A'. When all the liquor has passed over, the steam valve E' is reversed, steam is shut off from A, communication is opened to pipe D', and valve E' turned so as to admit steam to A', when the action of forcing the liquor through the cloth up the pipe E' into kier A is performed. This alternate passing of the liquor backwards and forwards, see-saw fashion, through the cloth, constitutes the operation of boiling. The steam also has great effect if left in contact with the cloth for a few minutes in one kier, after the liquor has gone over to the other kier. This process is continued for eight hours (nearly one-third the time formerly required in what are termed low-pressure kiers), with steam of from 30 to 50 lb, during which time the liquor passes about 16 times from one kier to the other; then the valves HH' are opened, and all the liquor expelled by the steam from the cloth into a drain. The steam is then shut off, the man-hole lids removed, and the ends of the two chains of cloth taken out and passed through pot eyes, which guide the pieces to the washing-machine.<sup>1</sup>

**Washing.**—The cloth as it issues from the kiers is found to have assumed a very dirty brown aspect. Formerly, the apparatus used for washing was either the wash-stocks or the dash-wheel, to which allusion has already been made. The machine now generally employed is represented in section in fig. 9. It consists of a pair of wooden bowls

FIG. 9. -Section of Washing-Machine.

of cylinders *a* and *b*, about 9 feet long, mounted in a strong framework, and arranged to press against each other in their revolution. Plane tree is the wood most suitable for making these bowls. Running underneath the whole length of the bowls is a box or trough *c* filled with water, near the bottom of which a rectangular roller *d* is fixed. The water in the box is constantly renewed during washing operations by a current flowing in at the middle and escaping at each end. Two chains of cloth are washed in this machine at the same time, one being introduced at each extremity of the roller. The cloth passes down into the water under the roller *d* and up to the wooden bowls, between which it is caught and nipped, and down again

into the water, working its way in a spiral manner from the end to the centre of the machine, passing nine times through the water and between the bowls in its progress. Its course inwards is guided by a strong wooden rail, from which pegs project, arranged according to the number of turns to be given to the cloth. In the centre part of the upper bowl there is a lapping of cotton rope, which projects a little above the surface of the wood, and serves to give the cloth, as it finally issues from the machine, a much stronger squeeze than it would obtain between the long even bowls, and thereby expels a large proportion of moisture. As the cloth travels inwards towards the centre of the trough, while the flow of water is outward to escape at each end, the cloth on each revolution is meeting water more nearly pure, till just at the point where it issues from the trough for the last time, the clean water entering the trough is powerfully spurted upon it, thus giving it a thorough rinse before it is finally squeezed. It is usual to pass the cloth from the lime boil either through a pair of such washing-machines, or twice through the same, in order to expel the last trace of calcareous soap and uncombined lime from the texture.

In addition to this machine various other devices have from time to time been proposed and introduced to perform the important operations of washing. Among these the continuous washer of Mr Henry Bridson of Bolton-le-Moors, Lancashire, patented in 1852, is deserving of notice as a simple and efficient washing machine. Mr Bridson's washer consists of an oblong tank or trough of cast-iron which, in use, is kept about half filled with water. Within this tank, just dipping into the water, two cross shafts are fixed, which are geared to revolve in the same direction by spur-gearing mounted outside the trough. Each shaft carries a pair of discs of large diameter, and between the discs of the two shafts a pair of bars placed diametrically opposite each other are mounted. These bars form flat winces or revolving frames, by the revolution of which the fabric is not only carried forward, but is in its progress caused to strike with great violence against the surface of the water. The intermittent flapping and shaking motion thus communicated to the material has a powerful effect in detaching adhering impurities from the cloth. Another form of washing-machine in use in Lancashire consists of a row of eight vats or troughs arranged in an ascending series, so that the overflow of water from the highest or last runs into the second highest, and so downwards till it escapes from the lowest or first. The cloth enters at the lowest trough, and is carried by guide-rollers up and down through the entire series, issuing at the top between a pair of squeezing rollers.

**Gray Sour.**—From the washing-machine the chain of cloth is passed through a pair of squeezers, by which a large proportion of moisture is expelled. The operation of souring, which comes next, is performed in an apparatus of the same construction as the washing-machine, the trough under which contains the souring liquor. For white bleaching a solution of hydrochloric acid of a strength of 2° Twaddle (sp. gr. 1010) is used, and for print bleaching the solution is made up to 4° Tw. Through this the cloth is passed up and down twice by the revolution of the bowls, and piled up in the sour in stillages for some hours. The object of the souring is to dissolve any traces of free lime which may have been left in the washing, and to decompose the calcareous soap.

**Second Boil.**—After having lain in the sour for a sufficient length of time the cloth is passed through squeezers to expel as much as possible of the acid, and again washed in the machine. It is next passed into a kier or set of kiers, precisely as after liming, for the second boil, which in the

<sup>1</sup> For this description of the Barlow kiers we are indebted to Mr William Mather

case of print bleaching is done with a solution of soda-ash and rosin. For a pair of Barlow kiers boiling 12,000 lb of cloth, the quantities used are 350 lb of soda-ash and 200 lb of rosin dissolved with 30 gallons of caustic soda at 70° Tw. The boiling is carried on for ten hours, in a like manner and at the same pressure as in the case of the lime boiling. The soda-ash and rosin form a soap, which dissolves out the free fatty acid in the cloth, and acts on the calcareous soap remaining by forming carbonate of lime and a soluble soda soap. In the white bleaching of 2700 lb of cloth, the boiling solution is 8 gallons of caustic soda at 70° Tw., but by some bleachers soda-ash is employed in the proportion of 80 lb to 2700 lb of cloth. From this boil the cloth is passed on to the washing-machine, and then squeezed, when it is ready for "chemicking" with the bleaching-powder solution.

**Chemicking.**—When the previous processes have been efficiently carried out, the cloth will, at this point, have attained a considerable appearance of whiteness and purity. The "chemicking" or liquoring with bleaching-powder which it now undergoes is conducted in a similar manner to the souring already described. The chemick is used as weak as possible, the solution varying from  $\frac{1}{2}^{\circ}$  to  $\frac{3}{4}^{\circ}$  Tw. (sp. gr. 1.009625 to 1.00125) according to the weight and condition of the cloth under treatment. It is run through this liquor, gently squeezed, and piled up for four or six hours. It is then squeezed and washed; and at this stage the bleacher has to judge whether the cloth requires to be chemicked a second time, which, in the case of heavy goods, is frequently necessary. If a repetition of the process is required, the cloth is again passed into the kiers, boiled with a solution of soda-ash, and the other processes repeated as before.

**White Sour.**—After lying in the chemick the goods are again washed and squeezed, and afterwards soured in machine with sulphuric acid, used at a strength of about 4° Tw. (sp. gr. 1.020), and piled up for a period of at least three hours. Thereafter, in order thoroughly to expel all acid the goods are twice washed, and finally squeezed, which concludes the operation of bleaching proper. The calico should now present a snow-white aspect, and should be fit to take the most delicate shades of colour when it is to be used for printing purposes.

**Opening.**—In passing through the numerous processes detailed in the foregoing statement, the cloth has been always in the form of a coil or loose rope. In the drawing from one machine to another it has been also pulled somewhat to the length at the expense of breadth, and in places it is likely to have become a little twisted. The pieces have therefore now to be opened out to their full width, and, if necessary, evened. The opening out is effected by passing the pieces to a winch placed at a considerable height when the weight of the cloth itself in passing upwards unfolds it, and the selvages are caught and extended by a boy just before it passes on to the winch. When necessary it is caught beyond the winch by an opening-machine, such as that patented in 1871 by Mr Wm. Birch of Salford. It is a complex apparatus, working by endless bands, on which are toothed projections, and these, travelling from the centre to the sides in opposite directions, open and spread out the cloth before it passes over the roller which is mounted on the machine. From the opener the cloth passes at once to the drying-machine (hereafter described), after passing over which cloth intended for printing is folded or batched on rollers, and its further treatment belongs to the art of calico-printing.

**Finishing.**—So far as regards bleaching proper the process is now at an end, and the further operations which white calicoes undergo have only for their object the improvement of their appearance for the market. But

although the finishing adds in no way to the quality of the material, it is regarded as of great value by the merchants, and the finish of a bleacher is of more importance than his bleaching. A great variety of finishing operations have to be employed, according to the different qualities of textiles, and the purposes to which they are devoted. Finishes are "beetled," "calendered" (either "stiff," "medium," or "soft," or "glazed,") and, for dress muslins, &c., "elastic." As the processes and appliances for these finishing operations are very numerous and varied, they cannot here be described in detail. In most cases they are the same as used in the finishing of calico prints, and more information will be found under that head. We shall here confine our remarks chiefly to the finishing of ordinary white beetled calicoes.

**Water Mangle.**—The cloth, when brought into the finishing-room, is passed over a stretching rail into a trough of boiling water and between a series of calender rollers, in which it is powerfully pressed. A common arrangement of the cylinders of the water mangle is to have a series of four, two of small diameter being made of copper, and two larger of condensed cotton; but wooden bowls are also sometimes employed with only a single intermediate copper cylinder. By this mangling process the water is equalized throughout the whole piece, the threads are flattened, and the cloth stretched, smoothed, and wound upon a roller, and thus rendered fit for receiving the starch.

**Starching.**—It is in this stage that so much is done by some bleachers to give cloth a factitious appearance of weight and bulk by filling up the interstices between the fibres with compounds which have no other object than to please or deceive the eye, and some of which have a decidedly deleterious influence on the tissue they are intended to improve in appearance. A great variety of mixtures, both cheap and nasty, are used by some finishers in place of starch with a view to produce weight and appearance, but, naturally, as little information as possible on this point is permitted to leak out to the public. What ought to be, and by reputable bleachers really is, used is pure starch, either of Indian corn or wheat, or both, made up into a stiff mucilage and blued with ultramarine or indigo. The cloth passes over a stretching rail into a trough of this starch, in which a roller is mounted. As it comes out of the starch it is caught between a pair of bowls, by which the superfluous starch is squeezed out and thrown back into the trough, the cloth passing on to the drying-machine. The starching mangle and drying-machine are seen together in fig. 10.

**Drying.**—The drying-machine (fig. 10), consists of a

FIG. 10.—Starching Mangle and Drying Cans.

number of cylinders made of tinned iron or copper, and filled with steam of low pressure. The cloth passes alternately back and face over one and the other, and emerges to be placed down at the end perfectly dry. This system of drying was introduced among the first mechanical appliances used in calico-printing, and has not as yet been superseded by any other plan. Various improvements in detail, we learn from Mr William Mather, as to the construction of the cylinders and the mode of applying steam to them have been recently introduced, but the machine remains the same. One important defect has been recently

removed by an alteration in the construction of the cylinders, to prevent collapse, in case a vacuum were formed by the rapid condensation of the steam. A spiral rib or stay is made to run from end to end of the body of the cylinder, giving support uniformly the whole length, and serving at the same time as a screw to drive the condensed water, as the cylinder revolves, to one end, where it is ejected through a nozzle. The steam enters at a nozzle, from the framing which is cast hollow, and serves as a pipe to distribute the steam to all the cylinders in the machine, while the framing on the other side serves in like manner to receive and discharge the water.

*Damping.*—From the drying cans the cloth is passed on to the damping-machine, where it is uniformly moistened by an exceedingly fine spray of water thrown upon it. The spray is thrown up by a circular brush, the tips of which are allowed to dip into water in a trough over which it revolves. Mather and Platt have introduced a manifest improvement on this plan by throwing the water in fine jets on the brush from a pipe which runs parallel with it. By this means the quantity of water and degree of moisture can be regulated with the utmost nicety. Fig. 11 shows the damping-machine in section as modified by

FIG. 11.—Damping-Machine.

Mather and Platt. *a* represents the circular brush revolving in a trough, and *b* is the pipe from which the water is squirted on the brush. The spray from the brush is confined by two sloping boards *c, c*, which work on quadrants, and the lever *d* raises or depresses the brush at

FIG. 12.—Elevation of Belt-Stretching Machine.

pleasure. The course of the cloth over the machine is indicated by arrows, and after damping it is batched on

an iron or wooden beam *e*, when it is ready for the process of beetling. When goods are to be finished of any particular width, they are at this stage broadthened by such an apparatus as the belt-stretching machine of Mather and Platt shown in elevation in fig. 12 and in plan in fig. 13. In

FIG. 13.—Plan of Belt-Stretching Machine.

this machine the full width of the cloth is obtained by the selvages being held firmly by a belt and pulley on each side, the pulleys revolving at such an angle that the stretch on the cloth has to compensate for the difference in distance between these pulleys at *A* and *B*.

*Beetling.*—The beetles ordinarily employed are a series of long heavy wooden piles arranged in a frame. These piles are alternately raised and allowed to fall with their full weight against the beamed cloth by the revolution of roller having a spiral series of notches, which catch a corresponding range of projections on the piles. The beam with the cloth is made to revolve gently by a ratchet motion as it is submitted to this hammering, which goes on for two or three hours. Recently Mr John Patterson of Belfast has patented and introduced a form of beetling-machine (fig. 14), which from its highly effective action

FIG. 14.—Patterson's Patent Beetle.

is likely to come into very extensive use. The advantages claimed for his machine over the common beetle Mr Patterson thus states: "Heretofore, the beetling of textile fabrics has been done by means of beetles, or stampers, falling upon the fabric by the action of gravitation, each stamper or beetle falling 55 or 60 times per minute through a space of 13 to 15 inches. This rate of speed cannot be accelerated by gravitation, and the consequence has been that in order to increase the quantity of work done by the ordinary beetles, very bulky and massive machinery has been employed, requiring large and expensive buildings and driving gear. The new beetling-machine requires not one-tenth of the space very much lighter gearing, and

instead of making 60 blows per minute, each beetle makes from 420 to 500 blows per minute. The blows are not by the action of gravitation, but are actuated by a series of cranks cut upon a solid steel shaft. There are connecting rods from the steel cranks to semicircular springs. The beetles are attached to, or suspended between, the points of the semicircular springs by means of leather straps. When the crank shaft is set in motion the beetles are snatched up in regular sequence by the upward motion of the cranks, and the springs are compressed by the weight of the beetles, as in fig. 15, and by the combined upward motion of the cranks and the springs the beetle is thrown upwards with great impetus. The upward motion is stopped as the cranks pass the top centres, and the beetles are thus met by the springs and thrown violently into them, causing them to be again compressed, as in fig. 16.

FIG. 15.

FIG. 16.

Hammers of Patterson's Beetle.

When by the downward motion of the cranks the springs are allowed to throw the beetles on the cloth beam, a rapid forcible whipping blow is imparted to the cloth, which does not cut or injure it in the manner often done by the slow dropping blows of the ordinary beetles. The weight of the blows can be instantly varied by varying the speed of the crank shaft, from the slightest touch to the heaviest penetrating blow. It is found that twice or thrice the number of folds of cloth can be beetled effectively on the cloth beams more than can be done on ordinary beetles, that is, instead of 200 folds on the beam, 400 or 600 folds can be equally well beetled on the new machine."

**Calendering**—When it is desired to finish cloth with a stiff or with a glazed finish, instead of being submitted to the operation of beetling, it is finished in the calender. The calender, as its name *κάλυδρος* implies, is a series of cylinders mounted above each other in a strong framework. The number of cylinders and the material of which they are constructed vary. In some only three cylinders or bowls are employed, and in others they are four or five. One or two of the bowls are made of metal, and two or three are either of wood, of condensed cotton, or of paper, and they must always be turned with great accuracy and be free from all warping. Cylinders of paper or condensed cotton have a very smooth surface and a considerable amount of elasticity. Between these cylinders the cloth as it comes from the damping-machine is passed, and twice, thrice, or four times, according to the construction of the calender, it is powerfully pressed. The pressure gives the cloth a very even surface, condensing the fibres, and produces a shining lustre. When the cloth is submitted to friction, as well as to pressure in a heated calender, a glazed finish is produced. The frictional effect is produced by the cylinders being geared to move at different rates of rapidity, so that in their revolution they rub over the surfaces of each other in addition to communicating pressure. Fig. 17 shows a finishing or friction calender in section. The metal cylinder *a* is made hollow so that it may be heated by the introduction of steam or gas, *b* and *d* are of compressed cotton or paper of the same diameter as *a*, and *c* is a smaller metal cylinder. The pressure of the cylinders is regulated by means of the screw *e*, and the compound lever *f*, which is adjusted by the double screw on the con-

necting rod at *g*. The cloth enters over stretching rails and rollers, passes through the calender in the manner indicated by the arrows, and is batched on roller *h*.

FIG. 17.—Section of Calender.

**Elastic Finish**—This particular kind of finish is applied to muslins and similar thin fabrics, and has to be done in highly-heated apartments called stentering stoves. Formerly the work was entirely done by manual labour, and consisted in holding the fabric by the selvages, and pulling it forward and backward while it was drying in the heated air. In this way the threads were made to rub against each other, and the cloth was thus deprived of the hard, stiff board-like appearance it would have possessed if left motionless when drying. Mr Ridgway Bridson was the first who introduced a machine which successfully supplanted hand labour in producing the elastic finish in muslins. His stentering frame is thus described:—Two horizontal rails or frames extend side by side the whole length of the machine, carrying at each end a large wheel or pulley, with small pins fixed at equal distances in its periphery. These pins pass through corresponding holes in an endless band which passes round the pulleys. On the surface of the endless bands are fastened very fine needle or tenter points to hold the selvages of the fabric as it passes through the machine. The horizontal rails can be moved away from each other laterally, so as to stretch the fabric breadthwise. The rails are of equal length with the fabric to be treated, which is fastened by the selvages at one end to the centre pins, and the pulleys being set in motion, the entire piece is carried on and stretched out over the machine, and the rails are then moved outwards to broaden the fabric. The elastic finish is given by communicating alternate vibrating motions to the two rails, by which a diagonal stretching is given to the muslin while in the process of drying.

At the conclusion of any of these various finishing processes, the goods are folded either in a plaiting-machine or by girls hooking plaits of definite length by the selvages on steel spikes. The end of each separate piece is then stamped with some device or motto intended to serve as a trade-mark. After the goods have been regularly folded, they are placed piece by piece, separated by sheets of

pasteboard, in a Bramah press, and after a certain interval an iron plate is substituted for the pasteboard, to prevent any inequality in the pile. Finally, the folded pieces are prepared for the market by fastening a band of gilt and ornamented paper around each end, which with the imprinted device is in some way regarded as a guarantee of good quality.

The whole operations of bleaching and finishing occupy on an average eight days, although goods can be hurried through much quicker if occasion arises. The cost, which of course will vary with the price of fuel and other circumstances, is very small as compared with the value of the material, and does not on an average, for shirting calicoes and the like, exceed 1½d. per lb weight of cloth.

#### BLEACHING OF THREAD.

We have been favoured by Messrs J and P. Coats of Paisley with the following outline of the processes in the bleaching of thread:—

1. The various Nos. of thread are prepared before boiling.
2. The first boil. The kier used is a common vanner, into which are put water and a solution of caustic lye,—the proportions being regulated by the number of pounds of thread to be treated.
3. The first bleach. The thread is placed in a box, and a sieve let down upon it. Underneath the box is a well which is filled with water and chlorine. The liquor is drawn up by a pump, and thrown upon the sieve, through which it passes, and filters through the thread into the well.
4. The thread is next moved into a souring-box, also covered with a sieve, where it is washed to take out the chlorine of the previous process.
5. A souring-well under the souring-box is now filled with water and sulphuric acid, and this mixture, called the *sour*, is pumped up on the sieve over the souring-box, through which it runs back into the souring-well, in the same manner as described in process No 3.
6. Before removing the thread from the souring-box it is washed with water through the sieve.
7. It is next washed in a washing-machine.
8. The scald, or second boil in kier. Various mixtures are used for it. Some prefer black soap and crystals of soda; others use caustic lye.
- 9-13. Repetition of Nos. 3, 4, 5, 6, and 7.
14. The thread is now extracted, i.e., dried in hydro-extractors.
15. Stocking. The stocks are boxes about 3 ft. long, by 2 ft. wide, and 2 ft. deep, with a large wooden mallet hung in each, similar to those used in bleaching linen. The thread banks having been properly prepared, so that they will not get loose, are put into the stocks with a mixture of hot soap and water, and beat there till of the proper colour. It is then taken out, and
16. Washed in washing-machine, and
17. Extracted.
18. The bluing process is done in a box filled with a solution of water and extract of indigo. As much thread is put in as the box will contain. It is let stand for a time, after which it is taken out and thrown on a barrow.
19. It is next taken to extractor and dried, and
20. Placed in the stove. After being a sufficient time there it is
21. Removed to cooling shed, where it is hung up to cool
22. It is now taken to stretching-machine, where it is passed over hot rollers to take out the curl and moisture received in cooling shed
23. Taken to warehouse, where Nos. are classed and made up in bundles.

#### BLEACHING OF LINEN.

The bleaching of linen is a much more tedious and difficult operation than the bleaching of cotton. The process of water-retting, or rotting, by which the fibre is separated from the woody portion of the stalk, lodges a large proportion of colouring matter in the fibre, with which it enters into very intimate combination. The amount of colouring matter which has thus to be dealt with in the bleaching of linen is very great, being as much as one-third of the entire weight of the fibre. In the early part of the century a great amount of public attention was given to a plan proposed by Mr James Leo for preparing flax fibre without the process of steeping or retting, by

which it was affirmed that, among other advantages, it would only be necessary simply to wash, in soap, linen fabrics made from fibre so prepared, to render them pure and white. Mr Lee obtained a special Act of parliament allowing the specification of his patent to remain sealed for seven years, and his plans were entered into in a most full and laborious manner by the Irish Linen Board. After the expenditure of many thousands of pounds on his machines and experiments, the plan had to be entirely abandoned as a failure. More recently, Chevalier Claussen renewed the attempt to prepare flax without steeping, by breaking it by means of machinery, separating the refuse part of the stalk from it, and then by a chemical process splitting the hollow fibres, so as to reduce them to a soft cottony state fit for spinning by means of the cotton-spinning machinery. The fibre was proposed to be split by steeping the prepared flax in a solution of carbonate of soda, and then plunging it into dilute sulphuric acid. The sudden evolution of carbonic acid gas within the hollow tube of the flax was said to have the effect of splitting up the fibre and reducing it to fine flat threads possessing the felting properties of cotton. Sir Robert Kane, in his Report to the House of Commons, May 20, 1852, states that the whole process failed. The machinery for the beating and cleansing of the flax failed to separate it sufficiently from the refuse part of the stalk; and the chemical process for the splitting of the hollow tube only broke up small portions of the exposed ends, leaving the greater portion untouched. Various other plans of preparing flax fibres without water or dew-retting have from time to time been proposed and patented, but hitherto none of them has stood the test of extended practical operation. Till towards the end of last century the bleaching of linen both in the north of Ireland and Scotland was accomplished by bowking in cow's dung and souring with sour milk. In the year 1764 Dr James Ferguson of Belfast received a premium of £300 from the Irish Linen Board for the application of lime in the bleaching of linen. Notwithstanding this reward the use of lime in the bleaching of linen was for a long time afterwards forbidden in Ireland under statutory penalties, and so late as 1815 "Mr James Barklie, a respectable linen-bleacher of Linen Vale, near Keady, was prosecuted for using lime in the whitening of linens in his bleach-yard." The bleaching of linen to the present day is conducted much more in the primitive fashion of last century than is the practice with cotton-bleaching. Owing to the stiffness and inelasticity of flax fibres, a great part of the machinery used for cotton is not available for linen, and solutions of acid and bleaching-powder require to be used in a very dilute condition for linen fabrics, involving frequent repetitions of the various processes before a satisfactory white is produced. "Crofting," or exposure to the air on grass, is also very largely resorted to in the bleaching of linens, especially for plain shirting and sheeting, which necessitates the possession of very extensive grass parks in connection with works, and renders the process both tedious and subject to the influences of the weather. A large proportion of linen cloth is half-bleached or improved in the yarn before being woven, and it consequently requires less bleaching than that which comes in its original "green" condition. The following is an outline of the two chief methods, with and without crofting, as pursued in the principal Scotch linen bleachfields at the present day:—

#### 1. WITHOUT CROFTING.

- |                                           |                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------|
| 1. Limed.                                 | 4. Soured with hydrochloric acid, and piled in <i>sour</i> for some hours. |
| 2. Boiled in open kier for about 6 hours. | 5. Washed at stocks.                                                       |
| 3. Washed at washing-mill or stocks.      |                                                                            |

- |                                                 |                                        |
|-------------------------------------------------|----------------------------------------|
| 6. Boiled in soda-ash for 8 or 10 hours.        | 10. Boiled in alkali for 6 or 7 hours. |
| 7. Again boiled.                                | 11. Liqueured in chlorine solution.    |
| 8. Liqueured in chlorine solution and piled up. | 12. Washed.                            |
| 9. Washed.                                      | 13. Soured with sulphuric acid.        |
|                                                 | 14. Washed.                            |

When necessary the processes from 10 to 14 are repeated. The whole processes occupy, on an average, four weeks.

#### 11. WITH CROFTING.

- |                                  |                                                          |
|----------------------------------|----------------------------------------------------------|
| 1. Boiled in lime.               | 10. Liqueured.                                           |
| 2. Washed.                       | 11. Washed.                                              |
| 3. Soured.                       | 12. Soured with sulphuric acid.                          |
| 4. Washed.                       | 13. Washed.                                              |
| 5. Boiled in alkali and washed.  | 14. Boiled in alkali.                                    |
| 6. Exposed on grass 3 or 4 days. | 15. Liqueured.                                           |
| 7. Boiled in alkali.             | 16. Washed.                                              |
| 8. Washed.                       | 17. Soured with sulphuric acid.                          |
| 9. Exposed on grass.             | 18. Washed, and processes 14 to 18 repeated if required. |

With exposure on the grass the bleaching of plain linens usually occupies from 4 to 6 weeks. The finishing processes are essentially the same as in the case of calicoes. The following are the stages in finishing linen damasks:—

- |                                               |                                            |
|-----------------------------------------------|--------------------------------------------|
| 1. Nipped in squeezers.                       | 7. Calendered.                             |
| 2. Blued in ultramarine blueing-water mangle. | 8. Dried on steam cans.                    |
| 3. Starched in starching-mangle.              | 9. Again calendered.                       |
| 4. Dried on steam cans.                       | 10. Viewed to detect rust spots and holes. |
| 5. Damped with fine spray.                    | 11. Lapped.                                |
| 6. Beetled.                                   | 12. Pressed in hydraulic-press.            |

Charles Tennant of St Rollox made some experiments in 1831 to determine by which parts of the process the chief loss was sustained during bleaching. The result was that in 1000 parts by weight, linen yarn lost—

|                                                |           |
|------------------------------------------------|-----------|
| In the now abandoned fermenting alkaline steep | 57 parts. |
| In 4 boils with caustic soda                   | 70 "      |
| In 4 steeps with chloride of lime              | 170 "     |
| In 4 steeps in the sour                        | 18 "      |

Total.....315 parts in 1000.

#### BLEACHING OF PAPER-MAKING MATERIALS.

In addition to cotton and linen rags, esparto or Spanish grass (*Macrochloa tenacissima*) is now very largely used for the manufacture of the better classes of paper. Wood, especially the wood of the aspen (*Populus tremula*), is also now applied as a paper-making material. Jute has been used for printing paper, and straw is very largely employed, but chiefly for brown and packing papers. These and the numerous other substances used for paper-making are all reduced to the condition of "half-stuff" before they come to undergo the operation of bleaching, and the treatment they receive in this stage varies only in the amount of whitening required, and consequently in the proportions of bleaching solution used. It is therefore unnecessary to notice more than the process followed in the bleaching of the "half-stuff," which in Great Britain is very frequently prepared from a mixture of esparto fibre and rags. The bleaching solution of chloride of lime is either prepared in specially constructed cisterns, fitted with revolving agitators and stored in a reservoir for use, or prepared for immediate use in a wooden vessel. When the solution is made up to the requisite strength, and all insoluble sediment has sunk to the bottom of the vessel, it is ready for pouring into the engine. From 4 to 10 lb of ordinary bleaching powder are used for every 100 lb of rag half-stuff, but a much larger proportion is required for esparto. Sulphuric acid in not more than a proportion of 1 lb to 4 lb of bleaching-powder is thereafter added to a highly dilute condition, and the whole, after mixing in the engine, is turned into the drainer, which is a large tank provided with a false bottom of perforated wood covered with wire-netting or bagging. In some cases the bleaching-liquids are not added to the pulp material till it is deposited in the drainer; and the acid

solution may be poured in first, or both solutions may be alternately used in small quantities. The bleaching process is sometimes carried on in separate engines constructed of materials not affected by the corrosive action of acid substances. Drained half-stuff may also be bleached in a suitable apparatus by the direct application of chlorine gas.

It is of the greatest importance to free the pulpy material from the last traces of chlorine before it is made into paper, as it would react upon the manufactured product and render it brittle. To eliminate the free chlorine and acid, &c., the pulp is washed in the beater with pure water till it ceases to redden litmus paper, or give other characteristic indications of the presence of such compounds. The prejudicial effects of chlorine and its combinations are also overcome by the addition of "antichlor," the hyposulphite of soda or of lime, which forms with them compounds that do not affect the colour of the paper, although it is desirable, as far as possible, to remove such compounds also by washing with water.

#### BLEACHING OF STRAW.

The fine wheat-straw used in Tuscany and elsewhere for straw-plaiting, after being cut, dried, and tied up in bundles, is stacked for a month. It is then spread out in a meadow, and exposed to the action of the sun and air, being frequently turned during that period. The lower joint of the straw is then separated, leaving only the upper joint with the ear attached,—this being the only part of the straw used. It is then steamed, and after that exposed to the action of sulphurous acid gas prepared by burning sulphur, which complete the bleaching. It is then tied up in bundles, in which state it is ready for the market. In the strawplait-making centres of Great Britain—Luton, Dunstable, &c., in Bedfordshire—straw is bleached, chiefly after plaiting, by the influence of sulphurous acid gas.

#### WHITENING AND CLEANING PRINTS, MAPS, BOOKS, AND OTHER ARTICLES OF PAPER.

Chlorine was first applied to this purpose by Chaptal, and his method was employed with the greatest success by Vialard and Heudier, who by Chaptal's process restored several of the most valuable books of the French National Library. Chaptal's *modus operandi* is thus described in his own words:—

"They begin by unsewing the book and separating it into leaves, which they place in cases formed in a leaden tub, with very thin slips of wood or glass, so that the leaves, when laid flat, are separated from each other by intervals scarcely sensible. The acid is then poured in, making it fall on the sides of the tub, in order that the leaves may not be deranged by its motion. When the workman judges, by the whiteness of the paper, that it has been sufficiently acted upon by the acid, it is drawn off by a cock at the bottom of the tub, and its place is supplied by clear fresh water, which weakens and carries off the remains of the acid, as well as its strong smell. The leaves are then to be dried, and, after being pressed, may be again bound up.

"The leaves may be placed also vertically in the tub; and this position seems to possess some advantage, as they will then be less liable to be torn. With this view I constructed a wooden frame, which I adjusted to the proper height, according to the size of the leaves which I wished to whiten. This frame supported very thin slips of wood, leaving only the space of half a line between them. I placed two leaves in each of these intervals, and kept them fixed in their place by two small wooden wedges, which I pushed in between the slips. When the paper was whitened, I lifted up the frame with the leaves, and plunged them into cold water, to remove the remains of the acid, as well as the smell. This process I prefer to the other.

"By this operation books are not only cleaned, but the paper acquires a degree of whiteness superior to what it possessed when first made. The use of this acid is attended also with the valuable advantage of destroying ink spots. This liquor has no action upon spots of oil, or animal grease; but it has been long known that a weak solution of potash will effectually remove stains of that kind.

"When I had to repair prints so torn that they exhibited only scraps pasted upon other paper, I was afraid of losing these fragments in the liquid, because the paste became dissolved. In such cases I enclosed the prints in a cylindrical glass vessel, which I inverted on the water in which I had put the mixture proper for extracting the oxygenated muriatic acid gas. This vapour, by filling the whole inside of the jar, acted upon the print, extracted the grease as well as ink spots, and the fragments remained pasted to the paper."

A solution of peroxide of hydrogen ( $H_2O_2$ ) has been used with great success in the restoration of valuable prints, as well as for cleaning and reviving oil painting darkened by the action of sulphurous vapours.

#### BLEACHING OF WOOL

The bleaching of wool and animal fibres generally is a much simpler and less important operation than is the whitening of vegetable fibres. Wool is covered with a peculiar varnish or greasy matter which impairs its qualities, and which it is the object of the bleacher to remove. To this varnish the name of "yolk" or "suint" is given. It is a fatty unctuous matter, chiefly derived from the cutaneous perspiration, but, no doubt, also secreted by the pores of the wool itself; and it imparts that peculiar heavy odour to sheep with which all must be familiar. From the researches of Vanquelin it would appear that this unctuous varnish consists chiefly of a kind of soap, together with a small quantity of waxy matter, a peculiar odorous animal substance, a mixture of potash salts, and a little lime. This varnish, in consequence of its soapy nature, is soluble in water, so that washing in pure water would remove the greater portion of it; but it is found more advantageous to remove it by the process termed "scouring."

Scouring is performed by means of an ammoniacal lye, prepared of river or other soft water mixed with stale purified urine, which is found to contain a large quantity of ammonia, upon which its action probably depends. The mixture is heated by steam to a temperature at which the hand of the workman can be easily held in it for a considerable time. In this bath the wool is left for from half an hour to two hours, according to the quantity of greasy matter it contains. It is then to be taken out and drained into a basket, so that the drainings may drop into the vessel in which it was steeped, that nothing may be lost. It must now be completely rinsed by exposing it in baskets to a continuous stream of clear water, while a workman is perpetually employed in stirring it with a pole, till the water passes off perfectly clear. As a substitute for urine pig's dung is sometimes used, and various other substances have been proposed and introduced, such as ammoniacal salts, soda-ash, phosphate of soda, and soluble glass. Recently a machine, Petrie's wool-washer, has been introduced for scouring wools. It consists of a range of three or four long tanks, clean water entering at one end of the series and flowing through the whole. The wool is introduced at the end of the range where the water escapes, and where it is consequently most highly charged with the impurities of the washing process, and it is carried forward from one tank to another till it is lifted out at the point where the pure water enters.

It is known that the wool is properly scoured by its filaments being smooth, long, slender, white, and perfectly free from foreign substances, and not having lost their natural tenacity. If this scouring be properly done there is no need of further washings in soaps, or otherwise, till the wool is subjected to the process called "sulphuring;" and in point of fact it is very rarely passed through any other process. Some, however, recommend for the finer wools, where a very delicate white is wished, that they should be passed through one, two, or more baths of soft soap. No caustic

alkaline lyes can be employed, as they destroy the wool altogether, dissolving it, and forming with it a kind of soap.

The process of sulphuring is applied to yarns and woven goods only when they are intended to be finished white or light bright colours. Formerly, the method of sulphuring woollen goods was to expose them in a close apartment to the vapour of burning sulphur. The goods were hung on poles, and when the chamber was filled, a quantity of sulphur placed in very flat and broad dishes was allowed to burn away gradually in the chamber, while every aperture by which the vapour could escape was carefully closed. After exposure to the sulphurous acid vapours from six to twenty-four hours the bleaching process was complete, and the goods withdrawn from the chamber. The same process is now much more expeditiously performed by Thom's sulphuring process. The goods are passed on a long chain up and down over a series of rollers in a small chamber filled with sulphurous acid vapours, and a few minutes suffice for the operation. Sulphite of soda acidified with hydrochloric acid is also used in France for the bleaching of woollen fabrics.

Cloth which is to be finished white after the sulphuring process is run through a bath containing some indigo carmine, which increases the brilliancy of the white. When it is to be dyed it is treated with dilute sulphuric acid, thoroughly washed, and dried.

#### BLEACHING OF SILK

Raw silk is covered with a kind of varnish, the nature of which was first thoroughly investigated by M. Roard. He showed that this varnish, instead of being a gum, as was usually believed, resembled a mixture of bees' wax and oil, with a resinous colouring matter, and in raw silk constituted 23 or 24 per cent. of the weight. The varnish is soluble in water, and affords a solution which forms a lather like soap. The yellow varnish is of a resinous nature, and is insoluble in water, but is soluble in alcohol. The waxy substance exists in all silks, but the whiter the silk the less wax does it contain.

The comparative composition of yellow and white raw silk is shown by M. Mulder's analysis:—

|                                 | Yellow | White. |
|---------------------------------|--------|--------|
| Fibroine .....                  | 53.37  | 54.04  |
| Gelatine.....                   | 20.66  | 19.08  |
| Albumen .....                   | 24.43  | 25.47  |
| Wax.....                        | 1.39   | 1.11   |
| Colouring matter .....          | 0.05   | ..     |
| Fatty and resinous matter ..... | 0.10   | 0.30   |

This varnish, or "gum," as it is technically called, gives the silk a stiffness and elasticity which, for many of the purposes to which silk is applied, it is desirable to remove. This is called "ungumming" by the bleachers of silk. Though many different processes have been suggested for this purpose, none seems to answer so well as the old process of scouring in a weak solution of soap. If, however, the silk be kept in the soap too long after the varnish is removed, it begins to lose body, and has its qualities impaired, becoming dull, stiff, and discoloured, in consequence of being partly dissolved. White or yellow silks may be completely scoured in one hour in the soap bath, using about 15 lb of water for each pound of silk, and a suitable quantity of the finest soap. The soap and silk should be put into the water half an hour before it is brought to the boiling point, and then be boiled one hour. They are then removed, wrung out, washed in pure water, and either exposed to the vapour of sulphur or passed through a solution of sulphurous acid gas in water.

The following is the process usually followed by the scourer of silks. A quantity of water is put into a boiler over a fire, and for every 100 lb of silk to be scoured ...

of very fine soap are dissolved. The solution is generally boiled; but before the silk is put into it, the heat must be lowered to about 90° Fahr., and at this temperature it must be kept during the process. The silks are to be hung in the liquor on rods or frames, and left till the gum is sufficiently destroyed,—care being taken 'to alter their position now and then, so that every part may be exposed to the action of the bath. When perfectly ungummed, they are flexible and of a dull whiteness; in this state they are to be wrung out to clear them of the soapy water, then well shaken, and put into coarse linen bags, in parcels of from 20 to 30 lb each.

These bags are now to be steeped in a fresh bath, or, as the workmen say, are to be baked. The bath is prepared in a manner and proportion much as before, except that the quantity of soap may be somewhat diminished as the heat is to be increased; for the silk is now to be boiled for an hour and a half, taking care to keep the bags from sticking to the bottom of the boiler, by frequently stirring them with a stick. For silk that is intended to be dyed, the former steeping in the lukewarm soap-bath is unnecessary, and the boiling only is employed, using a greater quantity of soap in proportion to the fineness of the colour. After boiling the silk is wrung as before, and then washed, and if it is found to be not sufficiently or not uniformly secured, it must be submitted to a fresh bath.

The white silk usually sold has a bluish shade given it by a bath impregnated with litmus or indigo. This is prepared by dissolving a pound and a half of fine soap in about 90 gallons of water, in which a small quantity of litmus or indigo has been diffused. This process gives to the silk the tints known by the names of "silver white," "azure white," and "thread white," according to the depth of shade which has been imparted. The "China white" tint is given by adding annatto to the bath instead of indigo.

From these processes the silk acquires a tolerably clear white, but the highest degree is given to it by the action of sulphurous acid, the silk being either, as is usually the case, subjected to the acid in the state of vapour, or immersed in a solution. At Lyons no soap is used in the tinting process; but, after being boiled, the silk is washed, wrung dry, sulphured, and then passed through water properly blued.

#### BLEACHING OF BEES'-WAX, &c.

Bees'-wax in its raw condition, as it is first melted up from the comb, is a yellowish coloured substance somewhat greasy to the touch, and having a faint honey-like odour. It often contains mechanical impurities, besides traces of honey, and to remove these and discharge the colour the following process is adopted:—The wax is broken up into small pieces and melted in a copper boiler, with water sufficient to keep it from burning. When melted it is run into a tub containing hot water, and while in the hot fluid condition the mechanical impurities it may have contained subside to the bottom. From this tub the melted wax flows

into a vessel, the bottom of which is perforated with small holes. Through these thin streams of wax are received on a cylinder kept revolving in water below, and thus fine threads of solid wax are produced. These are exposed on moistened sheets to the air and light for some days, during which they are occasionally turned and watered. By this exposure the wax loses much of its colour. It is then melted up into solid blocks and left for some time, after which the operations of melting, forming into threads, and bleaching in the light are repeated till it has attained a pure white translucent lustre, is of very firm consistency, and is free from all odour. Yellow wax is also decolorized by treatment with nitric acid, but chlorine, although it bleaches most expeditiously, is not available, as it leaves traces incorporated with the wax, which on burning evolves irritating fumes of hydrochloric acid. Palm oil, used in the manufacture of soap and candles, is bleached by the action of bichromate of potash and acid.

For bleaching generally, but especially for the bleaching of animal fibres and substances, the use of a considerable variety of processes, and of chemicals other than chlorine and sulphur compounds, have from time to time been proposed and to some extent put into operation. To some of these proposals incidental allusion has already been made, and generally their success has not been such as to warrant special notice. Among other substances which have been recommended for scouring wools and silks are feeble solutions of sulphides of sodium and of potassium, or aluminates of these alkalies, the cyanide of potassium, and a mixture of common salt and oxalic acid. The alkaline permanganates have also been frequently regarded as hopeful bleaching chemicals; and a few years ago the permanganate of potash was introduced and used by MM. Tessié du Motay and Maréchal, who, in connection with the permanganate, used a solution of the peroxide of hydrogen. To this latter substance a peculiar bleaching application has recently been given. Under the name of *golden hair water*, or *auricome*, a liquid is sold by hair-dressers which is found to hold in solution a large percentage of peroxide of hydrogen. The use of this solution gives to the hair the brilliant golden yellow tinge which has come to be regarded as a highly fashionable colour. Other applications of this powerful oxidizing and reducing agent have been suggested by its toilet use, and it has been employed for the bleaching of ornamental feathers, hair, &c. Doubtless, if it could be prepared in stable solution at moderate price it would be found extensively useful in bleaching and other industrial applications. It has also long been hoped that a means of applying ozone as a direct bleaching agent might be devised, but hitherto little success has been attained in this direction. In Germany ivory is bleached by steeping it a week in light naphtha or other volatile oil, and exposing it thereafter to the air and sunlight, by which the atmospheric oxygen becomes ozonized in contact with the ivory and thus whitens it.

BLEEK, FRIEDRICH, one of the greatest Biblical scholars that Germany has produced in modern times, was born on the 4th July 1793, at Ahrensbök, in Holstein, a village near Lübeck. While attending the elementary school there, he gave evidence of such ability that his father sent him, after he had acquired some knowledge of Latin and Greek, in his sixteenth year, to the gymnasium at Lübeck, where he spent three years, and there imbibed so great a love for the languages of antiquity, that he abandoned the idea of a legal career, which he had once entertained, and resolved

to devote himself to the study of theology. After spending some time at the University of Kiel, he repaired to Berlin, and there, from 1814 to 1817, enjoyed the instructions of De Wette, Neander, and Schleiermacher. The teaching of these distinguished men, especially of the last named, exercised a decisive influence upon the whole of his after life. So highly were his merits appreciated by his professors—Schleiermacher was accustomed to say of Bleek that he possessed a special *charisma* for the science of "Introduction"—that in 1818, after he had passed the

necessary examinations for entering the church, he was recalled to Berlin to occupy the position of *Repetent* or tutor in theology, a temporary post which the theological faculty had obtained for him, with a view of retaining his services in connection with that department of the university. In this position, besides discharging his duties in the theological seminary, he published, in Schleiermacher's and Lücke's *Journal* (1819, 1820, 1822), two dissertations, one on the "Origin and Composition of the Sibylline Oracles," and another on the "Authorship and Design of the Book of Daniel." These articles attracted much attention, and were distinguished by those qualities of solid learning, thorough investigation, and candour of judgment, which characterized all the productions of his pen. Bleek's merits as a rising scholar were recognized by the minister of public instruction, who continued his stipend as *Repetent* for a third year, and promised further advancement in due time. But the attitude of the political authority underwent a change. The excitement caused in academic circles by the dismissal of De Wette from his professorship in 1819, in consequence of certain injudicious expressions in the letter of sympathy which he had written to the mother of Sands, the murderer of Kotzebue, had not died out, and the odium and punishment which fell upon De Wette were shared in a greater or less degree by his friends. Bleek, who had been a favourite pupil of the banished professor, incurred the suspicion of the Government as one who was believed to hold extreme democratic opinions. Not only was his stipend as *Repetent* discontinued, but his nomination to the office of extraordinary professor, which had already been signed by the minister Altenstein, was withheld for two years. The mystery at last was cleared up. Bleek had been confounded with another individual of a similar name, one Baueleven Blech. Tardy justice was at length done, and in 1823 Bleek received the appointment to which his merits so well entitled him.

During the six years that Bleek remained at Berlin he twice declined a call to the office of ordinary professor of theology, once to Greifswald and once to Königsberg. In 1829, however, he was induced, on the death of Lücke, to accept his chair in the recently founded university of Bonn, and entered upon his duties there in the summer of the same year. For the space of thirty years he laboured with ever increasing success, attracting students to his lectures, not by any attractions of manner nor by the enunciation of novel or bizarre opinions on theological subjects, but by the soundness and thoroughness of his investigations, the remarkable impartiality of his critical judgments, and the exceeding clearness of his method of presentation. In 1843 he was raised to the office of consistorial councillor, and was selected by the university to hold the office of rector, a distinction which has not since been conferred upon any theologian of the Reformed Church. After a long and honoured academic life he died suddenly of apoplexy on the 27th February 1859, having been able to lecture to his students as usual on the previous day.

Bleek's works belong entirely to the departments of Biblical criticism and exegesis. His great merits as a critic and exegete consist, as has been already observed, in the thoroughness of his investigations, and especially in the candour of his judgment. The latter quality, indeed, he possessed in so remarkable a degree, that, as a recent writer has remarked, it has become "proverbial." His views, indeed, on questions of *Old Testament* criticism would be regarded in this country as those of the "advanced" school; for on all the disputed points concerning the unity and authorship of the books of the *Old Covenant* he was led to form conclusions opposed to received opinions. But with respect to the *New Testament*, his position was highly conservative. His defence of the genuineness and

authenticity of the gospel of St John is still regarded as the ablest that has yet appeared; and although, on some minor points, his views did not altogether coincide with those of the traditional school, his critical labours on the *New Testament* must nevertheless be regarded as among the most important contributions to the maintenance of orthodox opinions that the present century has produced. Bleek's works were published partly during his lifetime, and partly after his death. His greatest work, his commentary on the epistle to the Hebrews (*Brief an die Hebräer erläutert durch Einleitung, Uebersetzung, und fortlaufenden Commentar*) appeared in three parts, in 1828, 1836, and 1840 respectively. Of it De Wette said that "It was so distinguished for comprehensive learning and thorough untrifling industry, for so pure and transparent a love of truth and so profound a theological feeling, that it was entitled to one of the foremost, if not the very foremost, place among the exegetical works of our time;" and Delitzsch adds that "every one acquainted with the subject will endorse the judgment." This work was abridged by Bleek for his college lectures, and was published in that condensed form after his death by Pfarrer Windrath in 1868. In 1846 he published his contributions to the criticism of the gospels (*Beiträge zur Evangelien Kritik*, pt. i.), which contained his defence of St John's gospel, and which arose out of a review of Ebrard's *Wissenschaftliche Kritik der Evangelischen Geschichte*.

After his death were published—(1), his *Introduction to the Old Testament* (*Einleitung in das Alte Testament*), 3d edition, by his pupil Prof. Kamphausen, 1869, English translation, by Venables (from 2d edition), 1869; (2), his *Introduction to the New Testament*, 3d edition, Mangold, 1875, English translation, by Urwick, 1869, 1870; (3), his *Exposition of the first three Gospels*, by Holzmänn, 1862; (4), his *Lectures on the Apocalypse*, English translation, 1875. Besides these there has also appeared a small volume containing *Lectures on Colossians, Philemon, and Ephesians*, Berlin, 1865. Bleek also contributed many articles to the *Studien und Kritiken*. For further information as to Bleek's life and writings the reader is referred to Kamphausen's article in the *Darmstadt Allgemeine Kirchen-zeitung*, 1859, No. 20; to the same writer's article in Herzog's *Real-Encyclopædie*, vol. xix.; and to Lichtenstein's *Histoire des Idées Religieuses en Allemagne*, vol. iii.; and to Diestel's *Geschichte des Alten Testaments*, 1869. (F. C.)

BLEEK, WILHELM HEINRICH IMMANUEL, son of the preceding, distinguished by his researches in African philology, was born in 1827 at Berlin. He studied first at Bonn and afterwards at Berlin, where his attention was directed towards the philological peculiarities of the South African languages. In his doctor's dissertation (Bonn, 1851), *De nominum generibus linguarum Africae Australis*, he endeavoured to show that the Hottentot language was of North African descent. In 1854 his health prevented him accompanying Baikie in the expedition to the Niger; but in the following year he accompanied Bishop Colenso to Natal, and was enabled to prosecute his researches into the language and customs of the Kaffres. Towards the close of 1856 he settled at Cape Town, and in 1857 was appointed interpreter by Sir George Grey. In 1859 he was compelled by ill-health to visit Europe, and on his return in the following year he was made librarian of the valuable collection of books presented to the colony by Sir George Grey. In 1869 he visited England, where the value of his services was recognized by a pension from the Civil List. He died at Cape Town on the 17th August 1875. His works, which are of the first importance for African and Australian philology, consist of the *Vocabulary of the Mozambique Language*, Lond., 1856; *Handbook of African, Australian, and Polynesian Philology*, Cape Town and Lond., 3 vols., 1858-63; *Comparative Grammar of the South African Languages*, vol. i., Lond., 1869; *Reynard the Fox in South Africa, or Hottentot Fables and Tales*, Lond., 1864; *Origin of Language*, Lond., 1869.

**BLLENHEIM** (German, **BLINDHEIM**), a small village of Germany, in the kingdom of Bavaria, and circle of Swabia, situated on the left bank of the Danube, a few miles below Hochstadt. It is only remarkable as the scene of the defeat of the French and Bavarians, on the 13th of August 1704, by the English and the Austrians under the duke of Marlborough and Prince Eugene. Population, 751.

**BLLENHEIM HOUSE**, a princely mansion erected by Parliament for the duke of Marlborough at Woodstock, near Oxford, and, with the manor of Woodstock, settled on the duke and his heirs, in consideration of his military services, and especially his decisive victory at Blenheim. The large sum of £500,000 was voted for the purchase of the manor and the erection of the building, which, notwithstanding the strictures of Swift and the criticisms of Evans and Walpole, is a magnificent pile, built by Sir John Vanbrugh, in a massive Italo-Corinthian style. The front from wing to wing extends to 348 feet, and the great hall is a lofty and noble apartment in good proportions. There are a considerable number of fine pictures in the Blenheim collection, the most noted being "The Young St Augustine and Pope Gregory," by Titian, "Europa," "Esther," and "The Massacre of the Innocents," by P. Veronese, "St Jerome," by Tintoretto, "Magdalen," by C. Dolce, many historical subjects, by Rubens, portraits by him and Vandyck, and "The Woman taken in Adultery," and "Isaac blessing Jacob," by Rembrandt.

**BLESSINGTON, MARGARET POWER, COUNTESS OF**, novelist and miscellaneous writer, was born near Clonmel, Tipperary, Ireland, September 1, 1790. Her childhood was made unhappy by the bad temper, improvidence, and loose living of her father, and by the reduced circumstances of the family. Her early womanhood was made unhappier still by her compulsory marriage at fifteen to one Captain Farmer, whose drunkenness involved him in debt, and whose debts brought him to the King's Bench prison where he was killed by a fall in one of his drunken fits, in October, 1817. His wife had some time before left his house, and in February 1818 she was married a second time to the earl of Blessington. Celebrated for her wit, her literary accomplishments, her generosity, and her social attractions, she was no less distinguished by her passion for pleasure and her craving for show and a high style of living. In the gratification of these tastes debts were accumulated, and the estates of the earl soon became burdened with "incumbrances." In the autumn of 1822 they set out on a Continental tour, and remained abroad till the death of the earl, which took place at Paris in May 1829. Some years earlier they had become acquainted with Count Alfred d'Orsay, a man of fashion and seeker of pleasure, who was then serving in the army but quitted it for the sake of joining them. In 1827 he had connected himself with the family by his marriage with the only daughter of the earl by a former wife. After Lord Blessington's death Count d'Orsay, who had separated from his wife, came to England with the countess, and they lived together in London till her death. The home of the beautiful and brilliant countess (first Seamore Place, and afterwards Gore House, Kensington) became a centre of attraction for whatever was distinguished in literature, learning, art, science, and fashion. Ambitious of the distinction of authorship, Lady Blessington had published in 1822 her first work entitled *Sketches*, in two volumes. Ten years later she made herself favourably known by a *Journal of Conversations with Lord Byron*, which appeared first in successive numbers of the *New Monthly Magazine*, and soon afterwards as a separate work. This was followed by a long series of works, most of them novels of high life, several of which obtained considerable popularity. Her *Idler in Italy* and *Idler in*

*France* were rendered temporarily attractive by personal gossip and anecdote, descriptions of nature, and sentiment. Lady Blessington was for some years editor of Heath's *Book of Beauty* and the *Keepsake*, the popular annuals of the day, and also contributed largely to magazines and newspapers. Early in 1849, in consequence of failing resources, the splendours of Gore House were extinguished; its furniture and decorations were sold to pay debts, and its presiding genius withdrew to Paris, whither her friend Count d'Orsay had previously gone. She died there, June 4, 1849. Her *Literary Life and Correspondence*, 3 vols., edited by R. R. Madden, appeared in 1855.

**BLICHER, STEEN STEENSEN**, Danish lyrical poet and novelist, was born at Vium in Viborg, Jutland, on the 11th October 1782. He was extremely delicate in constitution, and after having passed a year or two at the university, which he joined in 1799, was compelled to give up his studies on account of a consumptive complaint. He accepted a situation as tutor in a family at Falster, and by vigorous physical exercise and flute-playing succeeded in restoring himself to health. He afterwards returned to the university, and completed his course in 1809. Several years were then spent at his father's parsonage, preparing for the ministry and managing the farm. In 1819 he was called to the church of Thorning, and in 1825 to a more remunerative charge at Spentrup. Here he died in 1848. Blicher was first known by his translations of Ossian, but his early poems did not attract much attention. He then contributed to a literary journal, the *Nordlyset*, in which appeared the first of his Jutland tales (*Jydske Romanzer*). The popularity of these romances was surpassed by that of the *National Noveller*, which give an admirable picture of country life in Jutland. His collected poems, some of which had appeared as early as 1814, were published in 2 vols., 1835-36; the novels appeared in 5 vols., 1833-36. A short sketch of his own life and character was prefixed by him to the complete collection, — *Old and New Novels (Gamle og nye Noveller)* 7 vols., 1846-47. Blicher also translated Goldsmith's *Vicar of Wakefield*.

**BLIDAH**, the chief town of an arrondissement in the province of Algiers in Algeria, about 30 miles inland from the capital, on the railway from that city to Oran. It lies at the base of the Algerian Atlas, in the midst of the fertile plain of Metija, and is beautifully surrounded with orchards and gardens, which afford a pleasant contrast to its ramparts and towers. It has well-built modern streets with frequent arcades, and pumbers among its buildings several mosques and churches, a Franco-Arabic and a Protestant school, extensive barracks, and a military hospital. Water is abundantly supplied by an aqueduct fed by the Oued-el-Kebir. As the centre of a flourishing district and a post on one of the main routes in the country it enjoys an extensive traffic, and the inhabitants maintain a thriving trade in oranges, raisins, grain, cotton, and tobacco. The products of the neighbouring copper-mines and of the cork-tree and cedar-groves are also of importance. In the vicinity are the two villages of Joinville and Montpensier, which owe their origin to the military camps established by Marshal Valée in 1838, and on the road to Medeah are the tombs of the Marabout Mohammed-el-Kebir and his two sons. Blidah was a town of some importance under the Turks, but in 1825 it was nearly destroyed by an earthquake. It was not till 1838 that it was finally built by the French, though they had been in possession for a short time eight years before. In 1867 it suffered from another earthquake which also nearly ruined the village of Chiffa. Population in 1872, 8113.

**BLIGH, WILLIAM**, admiral, was born of a good family in the south of England in 1754. He accompanied Captain

Cook in his second expedition as sailing-master of the "Resolution," and in 1787 was despatched to the Pacific in command of H.M.S. "Bounty," for the purpose of introducing into the West Indies the bread-fruit tree from the South Sea Islands. Bligh sailed, in 1787, from Otaheite, where he had remained about six months; but, when near the Friendly Islands, a mutiny broke out on board the "Bounty," headed by Fletcher Christian, the master's mate, and Bligh, with eighteen others, was set adrift in the launch. This mutiny, which forms the subject of Byron's *Island*, did not arise so much from tyranny on the part of Bligh as from attachments contracted between the seamen and the women of Otaheite. After suffering severely from hunger, thirst, and storms, Bligh and his companions landed at Timor in the East Indies, having performed a voyage of about 4000 miles in an open boat. Bligh returned to England in 1790, and he was soon afterwards appointed to the "Providence," in which he effected the purpose of his former appointment by introducing the bread-fruit tree into the West India Islands. He showed great courage at the mutiny of the *Nore* in 1797, and in the same year took part in the battle of Camperdown, where Admiral Duncan defeated the Dutch under De Winter. In 1801 he commanded the "Glatton" at the battle of Copenhagen, and received the personal commendations of Nelson. He was subsequently made governor of New South Wales, and vice-admiral of the blue. He died at London in 1817. He was an active, persevering, and courageous officer, although, perhaps, somewhat exacting in his manner.

**BLIND.** The blind, as a class, are limited to such narrow spheres of action that those unacquainted with the subject fail to realize how large a number of the human race are deprived of sight. In the temperate regions of the globe about 1 in every 1000 of the population is blind, but in less favourable climates the percentage is much greater. When we consider what medical skill has already been applied in Europe and America, not only for the relief but the positive prevention of blindness, we may readily conclude that in warmer and less civilized countries the class is more numerous and their condition more deplorable.

We rejoice that much can still be done by proper care and treatment to prevent blindness; for instance, ophthalmia of infants is a very common cause, and ought not to terminate in loss of sight, which in most cases results from neglect and dirt. Glaucoma is also a fruitful source of blindness, invariably causing loss of sight if left to itself; but, thanks to Professor Graefe's brilliant discovery, these cases are generally curable if operated on early. Another very common cause of blindness is serious injury to one eye, which is thus lost, and if the injured organ be not at once removed, sympathetic inflammation and destruction of the other is very apt to follow, resulting in total blindness, whereas, if the injured eye be at once removed the other is generally preserved.

Loss of sight from small pox is now comparatively rare, owing to the general practice of vaccination, but much undoubtedly may still be done towards diminishing the frequency of blindness by further advances in the art of treating eye-disease, and especially by spreading among all classes a knowledge of what has already been done in this direction.

It often occurs that children become blind through the most trivial causes by parents consulting unskilful practitioners. The improvement and increase in the number of well-regulated hospitals now makes it possible for every parent, however poor, to have the best medical advice and attendance.

In all ages of the world the blind have been the objects of pity and commiseration, yet it has only been within the

past century that Christian civilization in its grand onward march has taken them in its embrace, and shed the influence of its light upon their midnight darkness. During recent years leading philanthropists have given much earnest thought to the best methods of ameliorating and improving the condition of the blind. Nearly all the European Governments and the States of the American Union have made liberal provision for their education and special training. In Great Britain the work has been left thus far to charitable enterprise. Much, however, has been done,—almost every large town having its asylum, workshop, or home teaching society.

The following summary, from *A Guide to Institutions and Charities for the Blind*, prepared by M. Turner and W. Harris in 1871, will show the state of these institutions at a recent date:—

"In the year 1800 there were only four institutions for the blind in the United Kingdom; during the next thirty years six others were added to the list; in the succeeding thirty years seventeen more were opened; while within the last ten years twenty new ones have been established, making a total now of fifty-three, without including societies for visiting the blind at their homes, and other charities.

Scotland with five institutions sold, in the last year of which we have any report, goods of the value of £21,930, while England with forty institutions only sold in the same period goods of the value of £33,598; and Ireland, only £454.

Scotland provides for, on an average, 76 blind in each institution; while England only provides for 43, and Ireland for 60.

The donations and subscriptions in Scotland for the same year amount to more than £20 per head of the number benefited; while in England they amount to about £21, and in Ireland to about £16.

So far as returns have reached us, it appears that Mr Moon's system of reading for the blind is adopted by 38 institutions and home-teaching societies, while only 22 use the books of other systems—Lucas's, 7; Roman, 4; Alston's, 4; Frere's, 3; Braille, 4 (Since 1871 the use of Braille has been introduced into many other institutions.)

Of the 30,000 blind in the United Kingdom, there are only about 2250 being instructed or assisted to work. The total amount received per annum for the benefit of the blind, according to the answers received, is about £66,000; besides, there are twelve societies from which no return has been made. Of institutions for the blind generally, we may remark that in each institution nearly the same difficulties appear to exist, the principal one being the difficulty of selling the goods manufactured at such prices as will secure a ready sale and cover the cost of production, and consequently in most instances there is a large surplus stock. In cases where the stock is wholly disposed of, our observations lead us to think that sales have been secured by selling at a loss.

The principal trades practised by the blind in the United Kingdom are the making of baskets, brushes, brooms, mattresses, rugs, mats, caning of chairs, with knitting and sewing for women."

Within a few years a great impetus has been given in England to the higher education of the blind, by the formation of the British and Foreign Blind Association, the establishment of the College for the Blind Sons of Gentlemen at Worcester, and the Royal Normal College and Academy of Music for the Blind, Upper Norwood.

The first mentioned association "has been formed for the purpose of promoting the education and employment of the blind, by ascertaining what has been done in these respects in this and other countries, by endeavouring to supply deficiencies where these are found to exist, and by attempting to bring about greater harmony of action between the different existing schools and institutions.

"The founders of the association took as an axiom that in all questions which relate to obtaining impressions by touch the blind are the best judges; the council of the association therefore consists entirely of gentlemen who are either blind, or so nearly so that they have to use the finger instead of the eye for the purpose of reading.

"One main difficulty in the way of educating the young blind is the great cost of most of the appliances; this the council have endeavoured to meet by the manufacture of cheaper and better apparatus than any hitherto in use.

British and Foreign Blind Association.

No one who has not made the attempt can have any idea of the extreme difficulty of combining great accuracy and durability with cheapness. This has been in a great measure accomplished as regards the Braille writing frames, which are now within the reach of every blind person who wishes to avail himself of the advantages of writing. The fact that a large number of these frames has been already sold speaks for itself, and, as the great majority of the purchasers are poor, the quick sale is evidence not only of the cheapness of the frames, but also of the widespread desire for self-education existing among the blind.

"Another obstacle to the diffusion of the knowledge of the Braille system has been the absence of printed books in English. With the view of meeting this want one of the council has perfected the process of stereotyping used in France, by which the cost of production of stereotype plates is greatly reduced, and as the blind can themselves produce these plates, a new and remunerative means of employment has been discovered. Some school books have already been issued by the association, and will shortly be followed by others. The work on the *Education and Employment of the Blind*, by the honorary secretary, has been published under the sanction and at the expense of the association."

The following extract from an address delivered by the honorary secretary before the Society of Arts on the various types for the blind, shows how thoroughly they are investigating the subject —

"The happy idea of printing on paper letters recognizable by the touch is due to M. Haüy of Paris, who printed his first book in 1784, and founded the Institut des Jeunes Aveugles, Paris. The type he adopted was the script, or italic form of the Roman letter. This was introduced into England by the present Sir C. Lowther, who printed the gospel of St. Matthew in 1832 with type obtained from Paris, and followed it with other portions of the Bible. In 1834, Gall, of Edinburgh, printed the gospel of St. John in Roman capitals, in which, however, all curves were replaced by angular lines, and the lines themselves were serrated, which changes, he believed, gave greater distinctness to the letter.

Alston, of Glasgow, adopted Fry's plan of using ordinary Roman capitals. Dr. Howe, of Boston, U.S., makes use of the small Roman letters, giving them angularity according to Gall's idea.

The Philadelphia type does not differ much from Alston's. The combination of capitals with small letters has also been tried, and a society has recently been formed at Worcester with the intention of printing on a large scale in this type. In Germany various modifications of the Roman letter exist, the principal of which, the so-called Stachelschrift of Stuttgart, consists of Roman capitals formed by finely dotted lines. All these modifications are suggestive of the strong tendency among those who have attempted to benefit the blind to retain for them the form of letter to which the seeing are accustomed, while the constant change of form indicates a fact with which most blind persons are familiar from personal experience, viz., that none of these modifications are satisfactory as to the primary condition of being easily felt. A better form than any which has obtained currency was suggested twenty years ago by Mr. Welch, a blind man, who has been the pioneer of education amongst the blind of London, and this is almost identical with one independently worked out by Mr. Littledale of Cheltenham.

The second great class is made up of alphabets deviating more or less widely from the Roman letter, and consists of a stenographic shorthand invented by Mr. Lucas, a phonetic shorthand due to Mr. Frere, and a full written system introduced by Mr. Moon, in which the Roman letter is retained in a more or less modified form whenever he considered this could be done compatibly with easy recognition, the simple line-signs employed by Mr. Frere being used to replace the more complicated of the Roman letters. It will be necessary to examine these systems in detail, and it will facilitate this examination if we compare them with each other in the following particulars:—(a.) As respects the shape of the letter; (b.) As respects the advantage of conformity with the Roman letter; (c.) As respects the reading from right to left and from left to right alternately; (d.) Advantage of a shorthand as contrasted with a full written system.

(a.) *As respects the shape of the letter.*—Mr. Lucas and Mr. Frere brought out their systems about the year 1838, Lucas preceding Frere by a few months. They employed at first almost identically the same characters; but, unfortunately could not agree to represent the same sound by the same symbol. Mr. Frere had the advantage

of having his plan carried out by a very ingenious and sensible blind man, who soon discovered that the letters formed by lines and curves upon which dots were placed were too similar to those formed by the corresponding lines and curves without dots; he, therefore, changed all his dotted characters, replacing the dotted curves by angles of 45°, and the dotted lines by lines in which a short line is substituted for the dot.

The result of this change is, that Frere's character is now far superior to Lucas's in the quality of easy recognition. Mr. Moon's character, in the large size which is used by him, is quite as easily distinguishable as Frere's, but in the form in which he now prints his characters, his right-angles are not true right-angles, but are rounded. In the size which he uses, this defect is of very little importance, but it effectually prevents any considerable diminution, because, if this is attempted, the rounded right angles cannot be distinguished from the hooked lines.

The importance of using a character as small as is compatible with easy recognition may be readily understood from the following statement.—The largest type used by Mr. Frere is that employed in the gospel of St. John. The character is  $\frac{1}{4}$ -sixteenths of an inch long, and is about the same size as Moon's character. The pages occupied by the gospel of St. John in Frere are 96. In his medium type, in which the length of the letter is  $\frac{1}{8}$ -sixteenths of an inch, the same matter would go into 67 pages, and in his smallest type, in which the length of the letter is  $\frac{1}{16}$ -sixteenths, it would occupy 46 and a third pages. It has been found, by an experience extending over 27 years, and embracing many hundreds of individuals of all ages and conditions, that all those who can read the largest type can read the medium, and almost all can read the smallest.

The medium type is very generally preferred, as being more pleasant to the finger, and many with delicate touch prefer the smallest for the same reason. Thus it will be seen that, by selecting a well-devised character, not only can a very considerable saving be made in the size, and therefore in the cost of books, but by diminution of size, within certain limits, the character is rendered absolutely more legible. The gospel of St. John, in Moon's type, occupies 140 pages.

(b.) *As respects the advantage of conformity with the Roman letter.*—Much has been said and written on this subject. A favourite argument with the advocate of the Roman letter is, that by its use a blind man can be assisted in his reading by those around him who are possessed of sight. This, no doubt, would be valid if no simpler character for the blind had been invented, but when we have to choose between a character in the reading of which the blind can be assisted by the seeing, and one which is so simple that no assistance is required, there can hardly be a doubt as to which ought to be used.

Another plea for the use of the Roman letter is, that by its means the blind can write in a character understood by everybody. This writing is, as we shall presently see, a very imperfect process, but this argument is undoubtedly of some weight. These remarks apply simply to the existing systems in which the Roman letter is employed. It is probable that a much more legible alphabet might be constructed, but, after our 96 years of experience and experiments with the Roman letter, another failure may well be feared. The small angularized Roman letter of Dr. Howe of Boston, which is used in most of the schools of the United States, is probably as good a form as any, and if printed in a larger size would not be difficult to feel; in its present size, however, it is far too small, and has signally failed in America. The American schools are all State institutions, and have to furnish accounts to their respective State Legislatures of the work done by them.

Out of 664 pupils in seven schools, where the Roman character of Dr. Howe is used, one-third learn to read fluently, one-third by spelling, while none fail, and it must be borne in mind that those who learn to read by this system also acquire an admirable method of writing. Moon's system retains those Roman letters which can be easily distinguished, and thus makes a transition between the systems in which the Roman character is used and those which employ purely arbitrary signs. For this reason, and from its great simplicity of construction, it is more easily learned than any other, and therefore is well suited to the great mass of the poor, who from want of intelligence or of application cannot learn one of the shorthand systems. Its great bulk, however, involving costliness of production and comparative slowness of reading, is a serious obstacle to its general use.

(c.) *Reading from left to right, and from right to left, alternately.*—In Frere's system the lines are read from left to right, and from right to left, alternately, an arc of a circle taking the finger from the end of the upper to the beginning of the lower line. The plan may be illustrated by imagining the letters to be fixed on the upper edge of a loop string. Let it be supposed that this string is doubled backwards and forwards upon itself in such a way that the letters always occupy its upper edge. This will give a good idea of Frere's method of reversing the line, but only is the line reversed, but every letter in it is also reversed, so that the finger, when

moving forwards, whether towards the right or towards the left, meets the characters in the same position, and is, in fact, never moving backwards, in the same manner that a person may walk to the end of a room, turn and walk back, yet is moving forwards in both directions. Moon, on the other hand, while borrowing the reversal of the line from Frere retains the letters in the returning line in the same position as the advancing, so that the finger in the return line meets the characters in the opposite direction from that in the advancing line; and to those accustomed to Frere's simpler method of reversal an unpleasant feeling is produced, exactly comparable to walking backwards.

The following example of both modes of reversal, in which Roman Capitals are used, will make this clear:—

*Frere's Method*

WILL MAKE DARKNESS  
MEHT 3POFEB THOIJ

*Moon's Method*

I WILL MAKE DARKNESS  
MEHT EROFEB THGIL

No doubt habit will accustom a reader to either plan, and probably there is not much difference in the difficulty of either, but, as we shall see by-and-by, it is absolutely necessary for writing that the pupil should thoroughly understand that, whichever way he goes, he is moving forwards; it is, therefore, wise to accustom him in reading to a process which he will have to follow in writing. Opinions differ widely among the blind whether it is best to read forwards in one direction and backwards in the other, or forward in both; it seems, however, among those who have had experience of the return line, that there can be no doubt of its great value, as by its use no time is lost by the reading finger having to return from the end of the upper to the beginning of the lower line, and the setting free of the left hand enables it to follow the right in reading, to take its place, or to rest.

(d.) *Shorthand*.—By a shorthand system, reading is more rapid, and a nearer approach is made to the way in which the eye takes in a whole word at a glance, than in a full-written system. The books are also more manageable and less costly, but the stereographic method is distinctive of correct spelling, and in the phonetic method this is not even attempted; yet it is advisable, for many reasons, that the blind should be able to spell. The shorthand systems seem therefore to be of the same use to the blind as to the seeing—not being of universal application, but extremely useful to those who have to read much.

In all the systems which we have hitherto considered, the letters, whether Roman or arbitrary, are formed by raised lines. The method employed for writing them is as follows:—Small cubes of wood are used with projecting pin points, so placed as to assume the form of each letter. The paper to be written on being laid on a soft surface, the pin-point letters are pressed into it; each point carries some of the paper before it, forming a little prominence on the reverse side, and as the pin points are very close together, the series of little prominences formed by them feel to the fingers like serrated lines. This plan ought rather to be called printing than writing. It requires great practice, and is at the best very slow and imperfect; yet it has its uses, as by employing Roman capitals the blind can correspond with the seeing. The letters, however, are not sufficiently distinct, and communications from blind correspondents written in this manner, or with pencil, are less satisfactory, both to writer and reader, than if the letter had been written from dictation. Printing from the Roman letter (not embossed) can be effected by the blind, with considerable rapidity, by means of Hughes's typograph or Foucault's writing-machine; but the blind writer cannot read what he has written, and the apparatus is so costly that it is not procurable by the poor.

[A new machine called 'the type-writer,' has lately been invented in America. It is largely manufactured, and is coming into general use for the seeing. It is equally well adapted to the use of the blind, is very simple, and can be manipulated very rapidly. A skilful operator can write at least twice as fast as an expert penman. It is not only a valuable invention, but one superior to all others of the kind.]

Various plans exist to enable the blind to keep their lines when writing with a pencil or with a stile on carbonized paper, but such writing can only be used for correspondence with the seeing, and cannot, of course, be read by touch.

We come now to the third class of systems, viz., those in which the letters are formed by a combination of dots. These are:—

1. The Braille system, universal in France, both for writing and printing, and very much used for both purposes in Switzerland, and employed as the written character in almost all countries, with the exception of the United Kingdom.

2. The Carton type, which was introduced into Belgium by the Abbé Carton.

3. Hughes's system consists of large and small dots, and lines placed in different positions. It never obtained much currency, and

seems never to have attracted the attention which its ingenuity merited.

4. A modification of the French method has been lately proposed in New York, and seems to have much to recommend it.

To begin with the French method. This was invented in 1834 by M. Braille, a blind pupil of the *Institut des jeunes Aveugles*. It spread with great rapidity, and has, as we have before seen, become almost the universal written language of the blind. Its signs are purely arbitrary and consist of varying combinations of six dots placed in an oblong, of which the vertical side contains three and the horizontal two dots. For writing, a frame is used consisting of a grooved metal bed, containing ten grooves to the inch; over this is fitted a guide whose vertical diameter is  $\frac{3}{8}$  inch, while the horizontal diameter is  $\frac{1}{2}$ . This perforated guide is fixed into a light wooden frame, like the frame of a slate, which is attached to the grooved metal bed by hinges. The paper is introduced between the frame and the grooved bed. The instrument for writing is a blunt awl, which carries a little cap of paper before it into the grooves of the bed, thereby producing a series of little pits on the side next the writer. When taken out and turned over, little prominences are felt, corresponding to the pits on the other side. The reading is performed from left to right, consequently the writing is from right to left; but this reversal presents no practical difficulty as soon as the pupil has caught the idea that in reading and writing alike he has to go forwards. The brass guide has a double row of openings, which enables the writer to write two lines; when these are written, he shifts his guide downwards until two little pins, which project from the under surface at its ends, drop into corresponding holes of the frame, when the writer writes two more lines, and this operation is repeated until he arrives at the bottom of the page.

The first ten letters, from 'a' to 'j,' are formed in the upper and middle grooves; the next ten, from 'k' to 't,' are formed by adding one lower dot behind to each letter of the first series; the third row, from 'u' to 'h' is formed from the first by adding two lower dots to each letter; the fourth row, from 'a' to 'w,' similarly, by adding one lower front dot.

The first ten letters, when preceded by the prefix for numbers, stand for the nine numbers and the cypher. The same signs, written in the lower and middle grooves, instead of the upper and middle, serve for punctuation. The seven last letters of each series stand for the seven musical notes—the first series representing quavers, the second minims, the third semibreves, the fourth crotchets. Rests, accidentals, and every other sign used in music, can be readily and clearly expressed, without having recourse to the staff of five lines which forms the basis of ordinary musical notation, and which, though it has been reproduced for the blind, can only be considered as serving to give them an idea of the method employed by the seeing, and cannot, of course, be written. By means of this dotted system a blind man is able to keep memoranda or accounts, write his own music, emboss his own books from dictation, and carry on correspondence.

But this French system, though extremely useful, is not perfect. The letter is too small for ready recognition by the unskilful or hard-handed, and if this is sought to be remedied by increasing the size, the reading finger does not cover the whole of the letter, and has to proceed up and down, feeling out each letter, instead of following the even gliding motion essential to good reading. The modification proposed in New York remedies this defect, though this does not appear to have been the intention of its promoters. It proceeds on the principle that the letters occurring most frequently in the English language should be represented by the fewest number of dots, and that the letters should be so spaced that a letter composed of one dot should not, as is the case in the French system, occupy the same room as one with six dots. For this purpose the oblong, consisting of six dots, composing the root-form of the letter, is placed horizontally instead of vertically, the greatest vertical depth of any letter in two dots instead of three. From these two changes results a saving of about one-third in space; this involves a saving of about one-third in the price of printed books; writing is rendered more rapid; and as the size can now be increased, owing to the diminution of the vertical length of the letter, it can be made sufficient for the duller touch. Ten-word and part-word signs have been introduced, which effect a further saving of nearly one-third, while they do not interfere in the least degree with correct spelling. These advantages make it well worth while to consider whether the modification of the Braille system ought not to be adopted as the written system of all English-speaking blind; but before such a step is recommended, the question should be carefully considered in all its bearings on musical notation as well as on ordinary writing."

Regarding the Worcester College for Blind Sons of <sup>Worcester</sup> Gentlemen, founded in 1866 by the Rev. R. H. Blair, the College Report informs us that—

"It was opened with the view of giving to families of the better class an opportunity of educating their children in a systematic

manner, with a due regard to home comforts, and with surroundings befitting their position.

The course of education projected by Mr Blair was such as would convert the pupils into intelligent home companions, if no other object were desired. But a conviction, based on personal knowledge, that the blind were capable of the highest competition with the seeing, lay at the root of this gentleman's endeavours. Self-helpfulness and usefulness in the ordinary affairs of life is therefore but one of the first results which reward the teaching of the blind; and it appears that blind men can be made reproductive also, not only in the particular instance, but in the bulk, and that the arts of teaching and lecturing, acting as deputations, translating, presiding over blind or other institutions, the law, and in the most favoured cases the church, are fully within the capacity of the well-educated blind. A prejudice has hitherto existed against the employment of blind men, owing to their supposed incapacity, and certain other drawbacks resulting from neglect. Let this impression be removed, and there will be an increase in the number of positions open to them.

For an entrance into these walks of life, the training must be such as to enable its recipients to compete for university distinctions. The objections to this course, if they are entertained, will be removed by a little reflection on the nature and uses of a university; and the difficulties which in the idea of inexperienced persons a blind man has to overcome, are greatly diminished by being met and grappled with in early years, and are actually being materially lessened by the earnest efforts now made by blind instructors and investigators.

It is impossible to rule definitely at what age the school education of a child born blind should begin. Children vary as much in natural quickness as parents in the power of educating. A quick and resolute child will, through the clumsiness of nurses or the carelessness of a parent, early acquire tricks which it takes years to eradicate, and acquire habits and ways of thought and action which may have a profound effect on his after life. The sooner, therefore, a child can consistently with his health and other considerations be admitted to cheerful and active society, where his character can have free play and find sympathy, yet be quietly trained, the more easy will his education be afterwards. For those who have become blind from accident or disease, in childhood or towards the age of adolescence, one word of advice may be given. As soon as it is ascertained that the blindness is past remedy, the child should be sent to school, so that the habit of study may be remitted as little as possible. It is in the highest degree impolitic to allow the faculties to degenerate through several years' disuse, as is often done; and it is in reality kinder to a child or youth to send him away to pick up strength and consolation by the example of his cheerful and patient fellows, and to distract his grief by learning the instruments which he will ultimately need in his education, than to keep him in the indulgences of home, brooding over his misfortune, or buoyed up by a hope which will not be realized.

No claim to exclusiveness is asserted in the use of English types. There are useful works to be found in all; and when a pupil arrives who has been educated in one or other form of type, he is never discouraged from its continued use. But as uniformity of class-books is desirable, and one system must be employed as a basis, the Roman form, in which are printed books suitable for higher education, is adopted for class purposes. Dr Moon's type is read by some for recreation or private study, and the American Bible, which is the most portable yet printed, and is beautifully executed, is read by those whose dexterity, acquired by long practice, enables them to master this somewhat difficult, because small, type. After some years of practice the desire for smaller type seems to become a passion for those possessed of a quick and nimble touch.

Dr Moon's type is large and easy, and comprises the Bible, Prayer Book, and a large number of religious and devotional works, together with numerous stories, biographies, and other works suitable for the young and aged. Dr Moon has also several educational works of a very useful character; but his plan of action has not yet led him to enter largely into the production of higher literature."

The Royal Normal College and Academy of Music for the Blind has for its object the affording of a thorough general and musical education to the youthful blind of both sexes who possess the requisite talent, so as to qualify them for self-maintenance. The Report of the institution states that

"As without previous trial it would in many cases be difficult to determine whether an applicant for admission has sufficient capacity for the kind of education given at the college, candidates will first be received as probationers for a term of three months, or less. If, at the end of that period, they are found to possess adequate ability, they may become permanent pupils.

With a view to adapting the methods of instruction to pupils of different ages and capacities, the following classification has been adopted, viz.—A. The elementary section, the instruction in which

is designed especially for children from seven to nine years of age; B. The intermediate, for pupils from nine to twelve years of age; C. The junior, for pupils from twelve to fifteen years of age; D. The senior, for pupils from fifteen to twenty-one years of age. Exceptional cases over twenty-one years of age can only be admitted by special vote of the committee.

The college embraces three distinct departments—1. General education; 2. The science and practice of music; 3. Pianoforte tuning.

The department of general education embraces all the ordinary branches of a sound English education. Special care is bestowed on the intellectual training of the pupils; for experience has shown that in order to qualify the blind for self-support, it is essential to afford them a thorough general as well as musical education.

In the musical department both vocal and instrumental instruction is given, according to the improved methods which have been employed during late years with marked success in the leading institutions of France and America. This department embraces the culture of the voice, the study of the piano, organ, and other solo instruments, harmony, counterpoint, composition, the history of music, and the art of teaching.

In the department for training the pupils in the art of regulating and tuning pianos, pupils are instructed who have passed the age at which they might have become qualified for remunerative employment in other departments. Though a superficial knowledge of the art of tuning may be readily acquired by those deprived of sight, a prolonged course of careful training is necessary in order to enable them to become thoroughly successful.

Experience has shown that the blind can seldom fully support themselves merely by manual labour, and the great majority of those who have been trained to industrial trades continue to require charitable assistance during their whole life.

It is well known that many of the blind possess musical talent, yet only a small number in the United Kingdom have ever been qualified to earn their living by the profession of music.

Such was formerly the case in other countries, but during recent years great improvements in the general and musical education of the blind have been effected abroad, particularly in France and America, and large numbers of this class educated in the institutions of those countries have been enabled to maintain themselves fully by various pursuits, especially as skilled organists, teachers, pianists, and pianoforte tuners.

In view of the practical results of the improved education of the blind in other countries, the Normal College and Academy of Music was founded in order to afford similar advantages to the youthful blind of the United Kingdom.

The college was opened in March 1872, under the direction of a committee, including members of the governing bodies of various metropolitan societies and institutions for the blind, with an experienced principal, and a staff of highly-trained teachers.

Upwards of seventy pupils from London and other large towns have been under instruction; a number have already left the college, and are now regularly employed as thoroughly competent pianoforte tuners."

As it will be impossible in this article to give any lengthened account of the institutions on the Continent and in America, we will briefly sketch the plan of working in a few of the most progressive.

The following extracts from addresses delivered at the first European Congress of Teachers of the Blind at Vienna in 1873, will best give an insight into the schools of Saxony:—

Herr Reimer, superintendent of the *Preparatory School for the Blind* at Hubertusberg, pointed out that, "even among the families which are not very poor, blind children often grow up without learning to wash or feed themselves, with hands hanging soft and helpless at their sides, and thus become more incapable than the poorest, who are forced to exert themselves by the necessity of the case.

If they are not taught to help themselves at home, it is very difficult to teach them at school, and as the existing blind institutions cannot admit young children without injuring the education of the older ones, they ought to be taught in preparatory schools or Kindergarten separately, which should be established by the State.

In the preparatory school at Hubertusberg in Saxony, the first thing aimed at is the strengthening of the limbs, then to make the children use them properly, to make them help themselves instead of relying on others, to correct their bad habits and to improve their mental condition, arousing in their minds the love of God and of truth as well as conscience. All this must be done methodically, and each lesson must be given separately and repeatedly as well as most patiently.

The change wrought thus is wonderful, if the teachers are experienced. They must be encouraged to move about as directed, and the 'Frobel play and exercises' will be found useful. Waiting

strips of leather, and other occupations which combine play with work, are carried on with advantage. A good manager of Kindergarten can do them great good, and gymnastics give them the power of controlling their limbs; but every exercise must be first taught singly.

Object lessons must be given by means of models, stuffed animals, birds, fish, &c., to bring out the powers of memory and reason. Simple hymns and ballads are practised.

Very little technical work can be taught, except making rush baskets, &c., as the children are all under ten. This school has been carried on for eleven years, and the benefits of teaching blind children so early are plainly seen by all who watch the progress which they make when removed to the Blind Institution; they are fit for independent work at an age three years less than the average of those who do not go through it.

As the children pass through the institution more rapidly, there is also more room for those who become blind as adults."

Of the *National Blind Institution* at Dresden, Dr Reinhard, the director, said—"It is organized so that the working school forms an essential part of it, and when children enter it, consideration is at once given, not only to their physical, religious, and intellectual education, but also to their instruction in work. Whilst between the ages of six and eleven they remain in the preparatory school, and find inexhaustible occupation in Frobel's system of play and exercise.

'Playwork' is given them as they become fit for it; for the feeling that they can make something useful rejoices the little workers and excites their activity; it is important that they should learn early to aim at real work. They learn to plait reed mats, which is an excellent means of strengthening the muscles of the arm and hand, and they also make little rush baskets.

The range of their work is extended when they are transferred to the higher class, which is usually during their eleventh year; and from that time till their confirmation, which is generally at the end of their fourteenth year, they have at least three hours' work every day in the shops.

The work of the girls is, unfortunately, much restricted, and it is doubtful whether their learning to make baskets and rope is without injury to their constitution. Besides, we must not lose sight of the evils arising from their working with male overseers and workmen.

Hence, girls learn in general only knitting, plaiting counterpanes, chair-caning, hair-working, and sewing—as much as is required for mending their linen.

Hair-work has already been adopted in another institution, and is the most profitable work for blind girls, as a clever one can earn 7 or 8 groschen (about 9d.) a day by it, whilst the quickest knitter can scarcely make 2 groschen a day.

The boys learn either basket-making or rope-making; they learn in the rope factory various kinds of light work, and, when they have been confirmed, choose for themselves between these two trades, their muscles being strengthened by alternately being employed at both.

It is important to consider the grounds of fitness for these trades. Rope-making requires strength and health of body, for much of the work must be carried on in places exposed to the weather; and besides this it requires a great deal of dexterity which is not indispensable in basket-making. It is also of great importance that each should learn the trade in which he is most likely to succeed after leaving the institution; for the great object is that pupils should be fitted for independent work eventually.

All those who understand the subject are now convinced that the blind cannot be really helped by building asylums. If there were three times as many asylums as there are schools, there would not be room for all, and the inmates would never be satisfied with their condition. Even women prefer an independent life full of care to the sameness of an asylum, where one quarrelsome person often embitters the whole life of the institution.

If there is any possibility of establishing pupils of either sex without exposing them to the risk of losing their health, there can be no doubt that it is to be preferred to placing them in asylums.

"The Dresden Blind Institution is managed on the principle that the pupils, on commencing independent work, require much assistance before they can support themselves by it, and that the institution must give the necessary help. The director of the institution makes known to the manufacturers that a blind worker is coming to settle near them, and induces some of the families around to take an interest in him, and recommend him for employment. He also inserts in the newspapers short notices describing his capacity for work, and his difficulty in finding customers, &c., and requesting people to employ him.

The outfit required for pupils on leaving the institution consists of tools and clothing, and materials must also be provided at first. The cost of these is partly defrayed by the fund established for the purpose, partly by the savings of the pupils, and partly, if necessary, by a grant from the parish.

It is indispensable that the blind worker should have some person near in whom he can fully confide, and from whom he can

get advice and help in any time of temporary difficulty, whilst the manager of the institution can rely on his taking an interest in the worker, and seeing that he obeys the rules.

The purchase of raw material causes the greatest difficulty; the blind man has not the means of buying much at a time, and must, consequently, pay highly for it; therefore the institution helps him by buying it at wholesale prices and letting him have it at the same price in small quantities. The number of his applications for materials shows the managers whether the man is industrious.

More than 200 blind support themselves in Saxony by means of the aid afforded by the fund and their own exertions. The fund amounted, in 1873, to 85,000 dollars, subscribed in all parts of the country."

Previous to the Franco-German War, Mr Liebreich, a celebrated oculist and practical friend of the blind, by order of the empress of the French, prepared a report in regard to the *Institution Impériale des jeunes Aveugles* of Paris, in which he says that the institution—

"Is an establishment of the State, in which children of both sexes deprived of sight receive an intellectual, musical, and industrial training. Children are received at the age of 13 years. They remain in the institution 8 years, and are made professors, musicians, tuners of pianos, workmen and workwomen.

During the last ten years 110 male pupils have left the institution, concerning whom we have received satisfactory information. The workwomen, on the contrary, earn but very little; among 166 blind, 108 have received a very good education, which ensures to them an easy and independent living; 56 have received an elementary training, and have not been put entirely beyond the charge of public charity.

The annual expense for 200 pupils is very nearly 240,000 francs (of which 146,000 francs are given by the State), making an average of 1200 fr. (£48) per pupil,—the workman costing a little less, the artist a little more. This sum is not excessive for the education of a tuner, a professor, or an organist, but it certainly is for the education of a workman, who only receives an elementary training, and is not even qualified to earn his own living.

M. Gaudet, chief instructor of the institution, expresses disapproval of the simultaneous education of artists and workmen. He says, 'Realizing from the first the great difference which exists between the future of an organist or a piano tuner on one side, and of a blind workman on the other, the apprentices regard themselves as sacrificed; therefore they do all they can to become tuners, and thus often lose much time in fruitless efforts before they resign themselves to become workmen, and even then toil reluctantly. On quitting the establishment to follow their occupations, they are not habituated to assiduous toil; returning to their indigent families they regret the comfortable life of the institution, and finally become discouraged.'

Tuners begin ordinarily to work with piano manufacturers, and earn easily 1500 francs per year. If a little later they succeed in obtaining a town connection, they have no difficulty in earning double that or more. Some have even succeeded in uniting manufacture with tuning. The organists, by obtaining places in churches and by giving music lessons, very soon earn a good livelihood.

In short, the tuners, organists, and teachers have, in spite of their infirmity, become independent men, exercising honourable and lucrative professions; some have married and reared families, others have come to the aid of their indigent relatives.

Very different is the lot of the blind workmen, who by toiling without relaxation many more hours than sighted workmen, barely succeed in gaining a part of what they need to support themselves. By perfecting as far as possible the industrial training of the institution, a greater number of the male pupils might be enabled to earn 300 or 400 francs, but none far exceed this sum. The workwomen seldom earn more than 100 or 150 francs per year."

The institutions of America are not asylums, but in the truest sense of the word educational establishments, in which the blind, without regard to their future, receive a thorough education. The blind in the United States are socially far above those of any other country; large numbers of them become eminent scholars and musicians, and even their blind workmen enjoy a degree of comfort unknown in England or on the Continent.

The results achieved by the Perkins Institution at Boston, U.S., are particularly instructive. High-class musical training appears to have been commenced there about 13 years ago, previous to which time the results in this respect were far from being satisfactory. The report of 1867 states that music is now taught to all of both sexes whose natural abilities make it probable that under proper

instruction, they will succeed as organists, teachers of music, or piano tuners, and goes on to say—"The teaching of music and playing is now the largest single field open to the blind as a means of support, and it seems to be growing larger. People are becoming more disposed to employ them; and as they go forth from the school they have more and more ground of hope that they will find opportunities to earn their living in this way." The whole tone of mind among the musical pupils has been changed, for instead of looking forward to the future with fear and anxiety, they now feel a well-grounded confidence in themselves. It seems that in Boston, and in America generally, the blind are able to earn more as teachers of music than as tuners, which is exactly the reverse of the state of things existing in Paris, and may arise either from differences in the condition of the two countries, or from the training for teachers being more thorough at Boston than at Paris; but their experience is identical in one respect, which is, that the blind who have the requisite amount of talent are almost certain to make a good income out of music; but to attain this end they must aim high. It will not do to be equal to the average seeing teacher or tuner; they must be superior; and this involves a good musical notation with first-rate masters, instruments, and appliances, and above all, a determination on the part of managers and teachers to overcome all obstacles.

A few paragraphs from American reports will sufficiently illustrate the enlightened views held in that country in regard to the education of the blind.

"A school for the higher education of the blind should be specially adapted to the condition and wants of the persons to be trained. In it the course of study should be the same as in our best colleges. All instruction should be oral, and the apparatus and modes of illustration be addressed to the touch. It should be supplied with text-books, maps, diagrams, and the like, in raised characters. It should have large collections of models of various kinds, such as weights, measures, tools, machinery, and the like; mannikins and models showing the anatomy of plants and animals, as well as their outward form. It should have collections of shells, crystals, minerals, and the like; models and sections showing geological strata; philosophical apparatus adapted to the touch; in short, everything that can be represented by tangible forms.

It would amaze those who have not reflected upon it to know how much can be done in this way. Saunderson, the blind pro-

fessor of mathematics in Cambridge, not only knew ordinary money well, but he was an expert numismatist, and could detect counterfeits in a collection of antique coins better than ordinary persons could do by the sight.

Such an institute should have able professors and teachers, with special aptness for adapting their lessons to the condition of their scholars. It should furnish special facilities for the study of languages, ancient and modern, of mathematics, of pedagogy, and especially of music. It should also be well provided with everything necessary in a good conservatory of music, and have funds for the payment of competent teachers.

It is evident that there are a large number of persons to whom such an institute would be a source of great happiness, and a means of preparation for great usefulness.

A little reflection will show what a great advantage generous culture would be to a blind man, even if he were to be only a musician. Let him be ever so accomplished in his immediate art, he is under great disadvantages as compared with his competitors who can see. But if he has generous culture in other branches of knowledge, he will have advantages which few of them possess, and of course he will be more nearly on a level with them, and more capable of earning a living and enjoying it. Human effort will in such a case be successful in counteracting the principal evil which flows from the infirmity of blindness."

"The careful observer will see a marked difference between a hundred youths in a blind institution and the same number of boys in an ordinary school. This is especially true of the male sex. He will find among the blind a larger proportion of scrofulous, narrow-chested, angular, pallid, and feeble boys, who move sluggishly and soon tire; and a smaller proportion of those full-chested, chubby, rosy, elastic creatures, whom nothing can keep still, and nothing tire out.

Now, if the blind, as a class, have a much smaller *quantum* of life than ordinary persons, it must be either on account of some flaw in the stock whence they sprung, or of some peculiarity in their mode of life, induced by their infirmity, such as bodily inactivity; but it probably results from both causes. At any rate, it is a matter worth considering.

The following tables have been calculated from data furnished by *Vitality* seven American State Institutions for the Blind—namely, those of the New York, Ohio, Pennsylvania, Illinois, Missouri, Tennessee, and Blind Massachusetts, and are the results of careful discussion of data, by far the most extensive and trustworthy, it is believed, yet published in any country.

In each of these tables the number of the blind actually surviving in 1859 are compared with the numbers that *should* then be surviving, according to two different Life Tables—first, the Massachusetts Life Table, prepared by Mr Elliott, from the State Census and Registration Returns for the year 1855; and secondly, the English Life Table, prepared by Dr Farr of London, from the returns for the year 1841:—

TABLE 1.—Comparing the relative vitality (or ability to resist destructive influences) of the Blind, at divers ages of life, according to the combined experience of seven American State Institutions for the Blind, with that of the populations of Massachusetts and of England respectively. Calculated by Mr E. B. Elliott, Consulting Actuary, Boston.

| Ages on Admission. | Number of Persons Admitted (known whether Surviving or Deceased). | Average Age on Admission. | Average Years elapsed, to middle of 1859. | Number Deceased (before the end of 1859). | Number Surviving (to 1859). | According to Elliott's Massachusetts Life Table. |                                                                                  |           | According to Farr's English Life Table.    |                                                                                  |           |
|--------------------|-------------------------------------------------------------------|---------------------------|-------------------------------------------|-------------------------------------------|-----------------------------|--------------------------------------------------|----------------------------------------------------------------------------------|-----------|--------------------------------------------|----------------------------------------------------------------------------------|-----------|
|                    |                                                                   |                           |                                           |                                           |                             | Number that should be Surviving (to 1859).       | Deficiency of Actual Survivors, relative to the Number that should be Surviving. |           | Number that should be Surviving (in 1859). | Deficiency of Actual Survivors, relative to the Number that should be Surviving. |           |
|                    |                                                                   |                           |                                           |                                           |                             |                                                  | Number.                                                                          | Per cent. |                                            | Number.                                                                          | Per cent. |
| 0-6                | 14                                                                | 4.4                       | 19.1                                      | 1                                         | 13                          | 12.0                                             | -1.0 <sup>2</sup>                                                                | ...       | 12.0                                       | -1.0 <sup>2</sup>                                                                | ...       |
| 6-10               | 210                                                               | 7.7                       | 14.3                                      | 39                                        | 171                         | 189.2                                            | 18.2                                                                             | 9.6       | 189.8                                      | 18.8                                                                             | 9.9       |

Note.—This table may be read thus:—Between the ages of 6 and 10 the number of persons admitted to the above-mentioned Institutions, of whom it is known whether they were living in 1859 or had previously deceased, was 210; their average age on admission was 7.7 years; the average period elapsed since admission, and previous to the middle of the year 1859, was 14.3 years; the number of those who died before the end of the year 1859 was 39,—the number surviving in 1859 being 171. The number that should be surviving, according to the Massachusetts Life Table, is 189.2. Hence the number of actual survivors was 18.2 less than the number demanded by the Massachusetts Table, which deficiency is 9.6 per cent. of (189.2) the number so demanded. The number that should be surviving, according to the English Life Table, is 189.8. Hence the number of actual survivors was 18.8 less than the number demanded by the English Table, which deficiency is 9.9 per cent. of (189.8) the number so demanded.

<sup>1</sup> Calculated on the assumption that the average age on admission of the persons whose ages were not specified was the same as the average age of those whose ages were specified, to wit, 15.4 years. <sup>2</sup> Excess.

TABLE II.—Comparing the relative vitality (or ability to resist destructive influences) of the Blind, at different periods after admission, according to the combined experience of seven American State Institutions for the Blind, with that of the population of Massachusetts and England respectively. Calculated by Mr E. B. Elliott, Consulting Actuary, Boston.

| Years. | Number of Persons Admitted (known as Surviving or Deceased). | Number Deceased (Previous to the middle of 1859). | Number Surviving in 1859. | Average Age on Admission. | Average Number of Years Elapsed (to middle of 1859). | According to Elliott's Massachusetts Life Table. |                                                                             |           |                                            | According to Farr's English Life Table.                                     |                  |               |               |

Note.—This table may be read thus:—Of the 68 persons admitted to the before-mentioned institutions during the year 1844, 14 died previous to the middle of the year 1859, and 54 were surviving in that year. The average age on admission of the 68 persons was 13.9 years, and the average number of years elapsed between the time of admission and the middle of the year 1859 was about 15 years. According to the Massachusetts Life Table, the number that should be surviving in 1859 was 58.6, showing the number of actual survivors to have been 4.6 less than the number demanded by such table. The deficiency (4.6 + 5.3 + 2.6 = 12.5) of actual survivors relative to the number that should survive of those admitted during the three years 1844, 1845, and 1846, was, according to the Massachusetts Table, 8.9 per cent. of (58.6 + 37.3 + 44.6 = 140.5) the number demanded; and the deficiency of actual survivors relative to the number that should survive of those admitted during the seven years 1839 to 1845 inclusive, was, according to the same life table, 6.7 per cent. of the number demanded. In like manner may be read the results derived from comparison with the English Life Table.

TABLE III.—Summary of the results presented in the two preceding Tables, comparing the relative vitality (or ability to resist destructive influences) of the Blind, at divers ages of life, and also at divers periods after admission, according to the combined experience of seven American State Institutions for the Blind, with that of the population of Massachusetts and England respectively. Calculated by Mr E. B. Elliott, Consulting Actuary, Boston.

Deficiency in the number of the Blind that survived in 1859, relative to the number that should then be surviving.

| Ages on Admission. | According to the                   |                           | Date of Admission (in Periods of Three Years). | Average Years Elapsed (to middle of 1859). | According to the                   |                           | Date of Admission (in Periods of Seven Years). | Average Years Elapsed (to middle of 1859). | According to the                   |                           |

| All ages...        | 8.9                                | 10.3                      |                                                |                                            |                                    |                           |                                                |                                            |                                    |                           |

Note.—This table may be read thus:—Of the number of persons admitted to the above-mentioned institutions, between the ages of 10 and 14, the number that was surviving in 1859 was 8.6 per cent. less according to the Massachusetts Life Table, and 9.4 per cent. less according to the English Life Table, than the number that should then be surviving. Of the number of persons admitted during the three years 1838-40, from which the average time elapsing to the middle of 1859 was 20.0 years, the number that survived in 1859 was 12.3 per cent. less according to the Massachusetts Table, and 15.4 per cent. less according to the English Table, than the number that should then have been surviving. Of the number of persons admitted during the seven years 1839-45, from which the average time elapsing to the middle of 1859 was 16.6 years, the number that survived in 1859 was 8.7 per cent. less according to the Massachusetts Table, and 11.1 per cent. less according to the English Table, than the number that should then have been surviving.

According to the first table, it appears that, of the entire 1102 persons admitted whose after-history is known, 878 now survive, whereas the Life Table of Massachusetts calls for about 979 survivors, thereby indicating that the power of the blind, represented by the returns of these institutions, to resist destructive influences is about 9 per cent. (10%) less than that of the population of all England, and that the number of deaths is from 60 to 80 per cent. greater, according to the tables employed for the comparison, than the number required by such tables.

If we could draw our statistics from the blind as a whole, and not from the favoured few who have been taught in schools, the average duration of life would be much less. We should probably find the average amount of vital force, or power to resist destructive agencies, to be nearly one-fifth less than that of ordinary persons.

It is well known that the blind as a class are happy, contented, and cheerful. There are exceptions, of course, and it is unfortunate that Milton should have been one of them, because his eminence as a poet and scholar makes his example conspicuous, and his words to be taken as the natural language of a class of unfortunates. There have been others more admirable in this respect, for they set forth in their lives and conversation the sublime moral height to which men may attain by grasping courageously the nettle misfortune, and 'plucking thence the flower' happiness." (F. J. C.)

**BLOCH, MARK ELIEZER**, a German naturalist, born at Ansbach, of very poor Jewish parents, about the year 1730. Having entered the employment of a surgeon at Hamburg, he was enabled by his own exertions to supply the want of early education, and made great progress in the study of anatomy, as well as in the other departments of medical science. After taking his degree as doctor at Frankfort-on-the-Oder he established himself as a physician at Berlin, and found means to collect there a valuable museum of objects from all the three kingdoms of nature, as well as an extensive library. His first work of importance was an essay on the different species of worms found in the bodies of other animals, which gained the prize offered by the Academy of Copenhagen. Many of his papers on different subjects of natural history, comparative anatomy, and physiology, were published in the collections of the various academies of Germany, Holland, and Russia, particularly in that of the Friendly Society of Naturalists at Berlin. But his greatest work was his *Allgemeine Naturgeschichte der Fische* (12 vols., 1782-95), which occupied the labour of a considerable portion of his life, and is considered to have laid the foundations of the science of ichthyology. The publication was encouraged by a large subscription, and it passed rapidly through five editions in German and in French. Bloch made little or no alteration in the systematic arrangement of Artedi and Linnaeus, although he was disposed to introduce into the classification some modifications depending on the structure of the gills, especially on the presence or absence of a fifth gill, without a bony arch. To the number of genera before established he found it necessary to add nineteen new ones; and he described 176 new species, many of them inhabitants of the remotest parts of the ocean, and by the brilliancy of their colours, or the singularity of their forms, as much objects of popular admiration as of scientific curiosity. In 1797 he paid a visit to Paris, in order to examine the large collections of such subjects of natural history as had been inaccessible to him on the shores of the Baltic; and he returned to Berlin by way of Holland. His health, which had hitherto been unimpaired, began now to decline. He went to Carlsbad for its recovery, but his constitution was exhausted, and he died there on the 6th of August 1799.

**BLOCK MACHINERY.** A block is a case with its contained pulley or pulleys, by means of which weighty objects are hoisted or lowered with facility. There is nothing in the appearance of a block which, to an unpractised eye, would seem to require any stretch of mental ingenuity or of manual dexterity to manufacture. It is a machine apparently so rude in its structure, and so simple in its contrivance, that the name was probably given to it from its

general resemblance to a log or wood, as is obviously the case with a butcher's block, a barber's block, the block of the executioner, &c. Of the two constituent parts of a ship's block, the external *shell* and the internal *sheave*, every carpenter might make the one, and every turner the other; but still block-making is a separate branch of trade, and it is necessary that it should be, for the whole efficiency of the block depends upon the proper proportions being observed between the various parts and the accuracy with which they are adjusted.

Mr Walter Taylor of Southampton took out a patent in the year 1781, to secure the benefit of some improvement he had made in the construction of the sheaves. He also shaped the shells, cut the timber, &c., by machinery driven by water, and carried on so extensive a manufacture of blocks as to be able to contract for nearly the whole supply of blocks and blockmakers' wares required for the use of the Royal Navy. Mr Dunsterville of Plymouth had a similar set of machines wrought by horse-power. Both his blocks and Taylor's were said to be superior to those constructed by the hand, though still deficient in many respects.

It would appear that it was the enormous quantity of blocks consumed in the course of a long protracted war that first called the attention of the Admiralty or Navy Board to the possibility of some reduction being made in the expense of so important an article, and to the imprudence of depending entirely on a single contractor. On these considerations, it seems to have been the intention of Government to introduce, among other improvements in Portsmouth Dockyard about 1801, a set of machines for making blocks there. About this time, too, Mr Brunel had completed a working model of certain machines for constructing, by an improved method, the shells and sheaves of blocks. This model was submitted to the inspection of the lords commissioners of the Admiralty, and it was decided to adopt Mr Brunel's more ingenious machinery.

The advantages to be gained were those common to all cases in which machine work supersedes hand labour, and consisted in the fact that, after the proper sizes of each part had been determined by careful calculation and experience, the machine could be made to observe these sizes with unerring accuracy, and so avoid all variations due to the carelessness or ignorance of the workman; these considerations are in blocks, perhaps more than in most things, of the utmost importance. Another advantage was, that the blocks could be made by Brunel's machinery about 30 per cent. cheaper than hand-made blocks had been previously obtained by contract, and the importance of this to the Admiralty in those days, when all ships were so heavily rigged, having no steam to supplement their sail power, will be sufficiently seen when it is stated that the remuneration which Brunel was to receive for his invention was agreed to be the savings of one year, and that these savings were estimated at £16,621; in addition to this he received an allowance of a guinea a day for about six years while engaged on the work, and was paid £1000 for his working model—the total amount paid to Brunel for the invention amounting to about £20,000.

The process may be described as follows:—Pieces of wood are cut roughly to the size of the block, and the first operation is then performed by the *boring-machine*, which bores a hole for the pin, and one, two, or three holes, as the case may be, for single, double, or treble blocks, to receive the first stroke of the mortising chisel; the block is next taken to the *mortising-machine*, where the mortise or mortises for the sheaves are cut; after this, to a *circular saw*, conveniently arranged for cutting off the corners and so preparing the block for the *shaping-machine*, which consists principally of two equal and parallel circular wheels

moving on the same axis, to which one of them is firmly fixed, but on which the other is made to slide, so that these two wheels may be placed at any given distance from each other, and blocks of any size admitted between their two rims or peripheries. For this purpose, both rims are divided into ten equal parts, for the reception of ten blocks, which are firmly fixed between the two wheels. When the double wheel with its ten attached blocks is put in motion, the outer surface of the blocks, or those which are farthest from the centre, strike against the edge of a chisel or gouge fixed in a movable frame, which, being made to slide in a curved direction in the line of the axis, cuts those outward faces of the blocks to their proper curvature. A contrivance is attached to the cutting tool which allows of the curvature being altered in any required way. One side being shaped, the ten blocks are then, by a single operation, each turned one fourth part round, and another side is exposed to the cutting instrument moving in the same direction as before. A third side is then turned outwards, and after that the fourth side, when the whole ten blocks are completely shaped.

The velocity with which the wheels revolve, and the great weight with which their peripheries are loaded, would make it dangerous to the workmen or bystanders, if, by the violence of the centrifugal force, any of the blocks should happen to be thrown off from the rim of the wheels; to prevent the possibility of such an accident, an iron cage or guard is placed between the workman and the machine.

The last operation is performed by the *scoring-machine*, which cuts a groove to receive the binding or strapping of the block. The binding may be of iron or rope, and is very frequently of wire rope.

*The Sheaves.*—The machinery employed for making this part of the block consists of a *circular saw*, by which the log is cut into plates of the thickness required for the sheaves, according to their several diameters. These plates are next carried to a *crown saw*, which bores the central hole, and at the same time reduces them to a perfect circle of the assigned diameter. The sheave, thus shaped, is next brought to the *coaking-machine*, a piece of mechanism not inferior in ingenuity to the shaping machine for the shells. A small cutter, in traversing round the central hole of the sheave, forms a groove for the insertion of the *coak* or *bush*, the shape of which is that of three semicircles, not concentric with each other, nor with the sheave, but each having a centre equally distant from that of the sheave. The manner in which the cutter traverses from the first to the second, and from this to the third semicircle, after finishing each of them, is exceedingly ingenious. So very exact and accurate is this groove cut for the reception of the metal coak, and so uniform in their shape and size are the latter cast, the casting being made not in sand but in iron moulds, that they are invariably found to fit each other so nicely that the tap of a hammer is sufficient to fix the coak in its place. The coaks are cast with small grooves or channels in the inside of their tubes, which serve to retain the oil or grease for the pins.

The sheave, with its coak thus fitted in, is now taken to the *drilling machine*, which is kept in constant motion. In casting the coaks a mark is left in the centre of each of the three semicircles. This mark is applied by a boy to the point of the moving drill, which speedily goes through the two coaks and the intermediate wood of the sheave. Rivets are put in these holes and clenched by hand. The next operation is performed by the *facing-machine*, which has two cutters, so arranged as to finish the side and groove the edge simultaneously; then the hole for the pin is enlarged to its exact size by the *broaching-machine*. The pins, which form a very important part of the block, are

now made at Portsmouth, not of *iron* but of *steel*, carefully tempered by special appliances. They are turned by a *self-acting lathe*, and are then reduced to the exact required diameter, and polished in the *pin-polishing machine*. They are also, in this machine, subjected to a proof strain proportional to their sectional area, and thus the strength of the pin is guaranteed.

The blocks are invariably made of English elm, the grain of the wood running lengthways of the block; but in Germany recently, blocks have been made with the grain of the wood running across the block, the reason being that they are less likely to be split by the pressure on the pin of the sheave. The sheaves are made of *lignum vitæ*.

Three machines of each description for each operation, up to and including the facing-machine, are required. The smallest sized machines will make blocks of from 4 inches to 7 inches in length, the second size from 8 inches to 11 inches, and the largest from 12 inches to 17 inches. Two sizes of the *broaching-machine*, and one *pin-polishing machine*, are sufficient. Blocks larger than 17 inches are made by hand, 26 inches being the largest used in the Royal Navy.

As will be seen from the foregoing account, all machine-made blocks are cut out of a solid piece of wood; whereas hand-made blocks, larger than about 8 inches, are usually made in pieces, filled in at the ends and riveted together. It is questionable whether a block so made is not stronger than one cut out of the solid, as in the latter case the short-grained wood at the ends of the mortises is very liable to give way. In hand-made blocks the brass coak or tail of the sheave is not made of the peculiar shape described for machine-made blocks, but is usually of a circular shape.

The machinery for Portsmouth Dockyard, on Brunel's plans, was made by Maudslay, whose firm—now the very eminent firm of Maudslay Sons and Field—has since supplied block-making machinery to the Spanish, Turkish, and Russian Governments, and also to Chatham Dockyard; the last mentioned, however, has never been used, as the machinery at Portsmouth is capable of supplying all the dockyards, the demand for blocks being much less for the steamships and ironclads than it was formerly for the old sailing ships. The first cost of this machinery is so great that no private firm has yet ventured to set it up, and by whole of the blocks used in merchant ships are made by hand-labour, assisted by a lathe and two or three other simple mechanical contrivances. (T. M.)

**BLOCKADE.** It appears to have been the ancient practice of belligerents at the outset of a war to forbid by proclamation all trade on the part of neutrals with the enemy, and to treat as enemies all those who contravened the proclamation; and neutrals acquiesced tacitly in this practice until the commencement of the 17th century. In the course of that century the ancient practice came into question, as imposing on the commerce of neutrals an inconvenience not justified by any adequate necessity on the part of belligerents, and it has since fallen into desuetude. Belligerents, however, have still maintained, without any question on the part of neutrals, the practice of intercepting supplies going over sea to an enemy under certain conditions, namely, when a belligerent has invested an enemy's port, with the intention of reducing the enemy to surrender from the failure of supplies, and for that object a stoppage of all supplies to such port has become a necessary operation of the war. Any attempt, under such circumstances, on the part of a neutral merchant to introduce supplies into the invested port is a direct interference with the operations of the war, and is inconsistent with neutrality, and it accordingly subjects the offending party to be treated

as an enemy by the belligerent. The question, What constitutes such a belligerent investment of an enemy's port as to create an obligation on the part of neutrals to abstain from attempting to enter it, has been much controverted since the "armed neutrality" of 1780; but all uncertainty as to the principle upon which the decision in each case must proceed, has been put an end to by the declaration of the powers assembled in congress at Paris in 1856, that "Blockades, in order to be binding, must be effective, that is to say, must be maintained by a force sufficient really to prevent access to the enemy's coast." The question of fact will still be a subject for judicial inquiry in each case of capture, whether the conditions under which a blockade has been maintained satisfy the above declaration. If an asserted blockade is maintained in a manner which satisfies the above declaration, there is no limit to the extent of an enemy's coast which may be placed under blockade. There is also a general consent amongst nations that a neutral merchant must have knowledge of a blockade in order to be liable to be treated as an enemy for attempting to break it; but there is not any uniform practice amongst nations on this subject further than that when a blockade has become notorious, the knowledge of it will be presumed against every neutral vessel which attempts to enter the blockaded port. On the other hand, where a blockade is not notorious, it is in accordance with the practice of nations to give some notice of it to neutrals; and this notice may be communicated to them either by actual warning given to each neutral vessel which seeks to cross the line of blockade, or by a constructive warning to all neutrals resulting from an official notification of the blockade on the part of the blockading power to all powers in amity with it. It is a growing practice, if not altogether an established practice, amongst nations which accredit to one another resident envoys, for belligerents to notify diplomatically to the neutral powers the fact that they have placed an enemy's port under blockade; and it is the rule of the prize courts of Great Britain and of the United States of America to hold that, where such an official notification has been made, all the subjects of the neutral powers may be presumed to have knowledge of the blockade. Other powers, amongst which France may be mentioned, have been accustomed to direct their blockading cruisers to give warning of the blockade to each vessel that attempts to cross the line of blockade, and not to capture any vessel unless she attempts to break the blockade after such warning; but the practice of France agrees with the practice of other powers in not giving such warning after a blockade has become notorious. There is, further, a general practice amongst nations to treat the act of sailing with an intention to enter a blockaded port as an unneutral act, which will warrant the capture of a neutral merchant vessel by a belligerent cruiser on any part of the high seas, unless clear evidence is forthcoming from the captured vessel that the intention has been abandoned, or that its execution was contingent on the blockade being raised. After a port has been placed under blockade, egress is prohibited to all neutral vessels, except to such as have entered the port before the blockade was established, if they come out either in ballast or with cargoes taken on board before the commencement of the blockade. No warning is required to affect such vessel with a knowledge of the blockade, and if any such vessel should succeed in passing through the blockading squadron it becomes liable to capture as good prize by a belligerent cruiser on any part of the high seas, until it has reached its port of destination, when the offence is considered to be purged. Under the ancient practice both ship and cargo were confiscable for the breach of a blockade, and even the captain and crew were liable to be treated as enemies. A milder practice is now generally

observed as regards the captain and crew, and a certain equity is administered in the British and American prize courts towards the owners of cargo, where the ship and the cargo do not belong to the same parties, and the owners of the cargo have not any knowledge of the blockade, or have been unable to countermand the shipment of the cargo since the blockade has become known to them. In such cases the cargo is released, although the ship may be rightfully condemned to the captors. (T. T.)

BLOIS, the chief town of the department of Loir-et-Cher in France, is situated in the form of an amphitheatre on the steep slope of a hill on the right bank of the Loire, 35 miles S.W. of Orleans, in 47° 35' N. lat. and 1° 29' E. long. It is united by a bridge of the 17th century with the suburb of Vienne on the other side of the river. The houses of the older part of the town are frequently of antiquarian interest, and the streets, which are in many cases rather stairways than streets, have often a picturesque appearance. The castle is an immense structure built at different periods, part as early as the 13th century. It was the birth-place of Louis XII., and is noted as the scene of the assassination of the duke of Guise and his brother the cardinal by command of Henry III. Among the other remarkable buildings in the town are the Hotel de Ville, the episcopal palace, now occupied by the prefecture, the cathedral of St Louis (a modern structure), and the churches of St Vincent and St Nicholas. An ancient aqueduct, cut in the solid rock by the Romans, conveys the water of several springs to a reservoir, whence it is distributed to different parts of the town. Blois is the seat of a bishopric founded by Louis XIV., and has a communal college, a normal school, and two diocesan seminaries; an exchange, a hospital, a theatre, a botanical garden, a public library, and an agricultural society. It manufactures gloves, hosiery, hardware, and pottery, and has a considerable trade in wine, brandy, and timber. Population in 1872, 17,475. Though possibly existing under the Roman empire, Blois is first distinctly mentioned by Gregory of Tours in the 6th century, and does not become of much importance till the 9th or 10th, when it forms the chief town of a countship. From that date it appears very frequently in French history. In 1577 and 1588 the States-General were held in the city.

BLOMFIELD, CHARLES JAMES, bishop of London, was born on the 29th May 1786, at Bury-St-Edmund's. He received his first education at his father's school in that town, and was then transferred to the grammar school, where, under the able instruction of the Rev. M. T. Becher, he laid the foundations of an unusually sound and thorough classical scholarship. His career at Trinity College, Cambridge, which he entered in 1804, was brilliant. He gained the Browne medals for Latin and Greek odes, and carried off the Craven scholarship. In 1808 he graduated as third wrangler and first medallist, and in the following year was elected to a fellowship at Trinity College. The first-fruits of his scholarship was an edition of the *Prometheus of Æschylus*, in 1810; this was followed by editions of the *Septem contra Thebas*, *Persæ*, *Choephore*, and *Agamemnon*, of Callimachus, and of the fragments of Sappho, Sophron, and Alcæus. Blomfield, however, soon ceased to devote himself to mere scholarship. He had been ordained in 1810, and held for a short time the curacy of Chesterford. He was then presented to the rectory of Quarrington, and shortly afterwards to that of Dunton, in Buckinghamshire, where he remained for about five years. In 1817 he was moved to the benefices of Great and Little Chesterford and Tuddenham, and he was in the same year appointed private chaplain to Howley, bishop of London. In 1819 he was nominated by Lord Liverpool to the rich living of St Botolph's, Bishopsgate, and in 1822

he became archdeacon of Colchester. Two years later he was raised to the bishopric of Chester, and in that position began his career of incessant labour for the advancement of the church. Many reforms were needed in the diocese, and the new bishop's energy and ardour succeeded in effecting much, though not without stirring up enemies. In 1828 he was transferred to a wider sphere of activity, being raised to the bishopric of London. This important office he held for eight-and-twenty years, labouring incessantly in a field where unremitting exertion was absolutely necessary. He gave his whole heart to the endeavour to extend the influence and efficiency of the church, and his strenuous activity was not without result. In all political or social movements which concerned the church the bishop took a prominent part. He was noted as being one of the best debaters on the episcopal bench in the House of Lords; he took a leading position in the action for church reform, which culminated in the Ecclesiastical Commission; and he did much for the extension of the colonial episcopate. His health gave way under his unceasing labours, and in 1856 he was permitted to resign his bishopric, retaining Fulham palace as his residence, along with a pension of £6000 per annum. He died at Fulham on the 5th August 1857. In private life Blomfield was warm-hearted, genial, and kindly; he was fond of travelling and of intellectual society, in which he was well qualified to shine. His published works, exclusive of those above mentioned, consist of charges, sermons, lectures, and pamphlets, and of a *Manual of Private and Family Prayers*. He was a frequent contributor to the quarterly reviews, chiefly on classical subjects. An admirable memoir has been published by the bishop's son, *Memoirs of Charles James Blomfield, D.D., Bishop of London, with Selections from his Correspondence*, edited by his son, Alfred Blomfield, M.A., &c., 1863. See also Biber, *Bishop Blomfield and his Times*, 1857.

BLONDEL, DAVID, a Protestant clergyman, distinguished by his proficiency in ecclesiastical and civil history, was born at Chalons-sur-Marne in 1591, and died in 1665. In 1650 he succeeded G. J. Vossius in the professorship of history at Amsterdam. His works were very numerous, and were remarkable even at that period for obscurity of style. The most celebrated of them was the dissertation on Pope Joan, in which he came to the conclusion that the whole story was a mere myth. Considerable Protestant indignation was excited against him on account of this book.

BLOOD. See ANATOMY and PHYSIOLOGY

BLOOD, THOMAS, generally known by the appellation of *Colonel Blood*, was a disbanded officer of the Parliamentary army. Bearing a grudge against the duke of Ormond, who had defeated a conspiracy he engaged in to surprise the castle of Dublin, Blood seized the duke one night in his coach in St James's Street, and carried him off a considerable distance, resolving to hang him at Tyburn; but Ormond struggled for his liberty and was rescued by his servants. Soon after, in 1671, Blood formed the design of carrying off the crown and regalia from the Tower,—an attempt which very nearly proved successful. He had bound and wounded Edwards, the keeper of the jewel-office, and had escaped out of the Tower with his prey; but he was overtaken and seized, together with some of his associates. One of these was known to have been concerned in the attempt upon Ormond, and Blood was immediately concluded to be the ringleader. When questioned, he frankly avowed the enterprise, but refused to discover his accomplices. All these extraordinary circumstances induced Charles II. to seek an interview with him, which not only led to his pardon, but to the king's granting him an estate of £500 a year in Ireland, encouraging his attendance about his person,

and showing him great favour. He died August 24, 1680.

BLOOMFIELD, ROBERT, was born of very humble parents at the village of Honington in Suffolk, in 1766. Losing his father at the age of eleven, he was apprenticed to a farmer, and could only cultivate his literary tastes by perusing such books as he could borrow. Thomson seems to have been his favourite author, and *The Seasons* inspired him with the ambition of being a poet. He came to London, and composed *The Farmer's Boy* in a garret in Bell Alley. The manuscript fell into the hands of Capel Loft, who encouraged him to print it, and it succeeded so well, that above 26,000 copies of it were sold. His reputation was increased by the appearance of his *Rural Tales, Songs and Ballads, News from the Farm, Wild Flowers*, and *The Banks of the Wye*. These are of unequal merit; but all breathe a spirit of purity and enthusiasm for the beauties of nature, that place the name of Bloomfield among the most natural and amiable of our pastoral poets. The extensive sale of *The Farmer's Boy* and *Wild Flowers* seems to have done little for the benefit of the poet, who died in poverty at Shefford in Bedfordshire in 1823. His *Remains in Poetry and Verse*, 2 vols., appeared in 1824, and another edition of his poems in 1866. A selection from his correspondence, edited by Hart, appeared in 1871.

BLOUNT, CHARLES, younger son of Sir Henry Blount, was born at Upper Holloway, April 27, 1654, and died 1693. He gained considerable reputation as a politician and man of letters, but his abilities were not great, and his strength lay in scoffing infidelity. His *Anima Mundi, or an Historical Narration of the Opinions of the Ancients concerning Man's Soul after this Life, according to Unenlightened Nature*, gave great offence, and his translation of Philostratus's *Life of Apollonius Tyanæus* was suppressed for the flippancy and impertinence of its attacks on revealed religion. A similar work of his, called *Great is Diana of the Ephesians*, under colour of exposing superstition, struck at revelation. In 1684 he printed a kind of introduction to polite literature, under the title of *Janua Sequentiarum*. His *Just Vindication of Learning and of the Liberty of the Press* (1693) is a shameless plagiarism from the *Areopagitica*. The pamphlet which he sent anonymously to Bohun, the censor, entitled *King William and Queen Mary Conquerors*, set all London in a flame, and completely attained its object, the ruin of Bohun. Indirectly it had a good result in directing attention to the folly of the censorship. After the death of his wife, he proposed to marry her sister, and wrote a letter on that subject with great learning and address, but the archbishop of Canterbury and other divines decided against him, and the lady having therefore refused him, he is said to have shot himself, or, according to Pope's account, to have given himself a mortal wound in the arm. A collected edition of his works was published in 1695 by Gildon, with a life by the editor. See Macaulay, *History*, iv. 352, *sqq.*; Lechler, *Ges. d. Englisch. Deismus*, 114-127.

BLOW, JOHN, an English musical composer, was born in 1648 at North Collingham in Nottinghamshire. He was educated at the chapel royal, and distinguished himself by his proficiency in music, having composed several anthems at an unusually early age. In 1673 he was made a gentleman of the chapel royal, and in 1685 was named one of the private musicians of James II. In 1687 he became master of the choir of St Paul's Church; in 1695 he was elected organist of St Margaret's, Westminster, and in 1699 composer to the chapel royal. In 1700 he published his *Amphion Anglicus*, a collection of pieces of music for one, two, three, and four voices, with a figured-bass accompaniment. Doctor Burney says that in the *Amphion*

*Anglicus* "the union of Scottish melody with the English is first conspicuous." Blow died in 1708, and was buried in the north aisle of Westminster Abbey. None of his compositions, most of which are anthems, attain the highest order of merit.

**BLOWPIPE**, a tube for directing a jet of air into a fire or into the flame of a lamp or gas jet, for the purpose of producing a high temperature by complete and rapid combustion. The blowpipe has been in common use from the earliest times for soldering metals and working glass; and since 1733, when Anton Swab first applied it to analysis of mineral substances, it has become a valuable auxiliary to the mineralogist and chemist, in the chemical examination and analysis of minerals. Its application has been variously improved at the hands of Cronstedt, Bergmann, Gahn, Berzelius, Plattner, and others, but more especially by the two last-named chemists.

The simplest and oldest form of blowpipe (still used by gasfitters, jewellers, &c.), is a conical brass tube, about 7 inches in length, curved at the small end into a right angle, and terminating in a small round orifice, which is applied to the flame, while the larger end is applied to the mouth. Where the blast has to be kept up for only a few seconds, this instrument is quite serviceable; but in longer chemical operations inconvenience arises from the condensation of moisture exhaled by the lungs in the tube. Hence many blowpipes are made with a cavity for retaining the moisture. Cronstedt placed a bulb in the centre of his blowpipe. Dr Black's convenient instrument consists of a conical tube of tin plate, with a small brass tube, supporting the nozzle, inserted near the wider end, and a mouth-piece at the narrow end. One of the most suitable forms of blowpipe is that shown in fig. 1. It is Gahn's instru-

FIG. 1.—Extremities of Gahn's Blowpipe,—ordinary size.

ment as improved by Plattner. The tube A is ground to fit accurately into a socket at the top of the water-trap B, as is also the jet-pipe C. The nozzle D, of platinum, is fitted in the same manner, so that it can be easily removed and replaced while hot; e.g. when it is desired to remove the crust of soot which deposits upon the point when an oil lamp or candle is used. The sizes of orifice recommended by Plattner are 0.4 and 0.5 millim. The trumpet mouthpiece, from the support it gives to the cheeks when inflated, conduces to a more steady and long-continued blast being kept up without fatigue than when the mouthpiece is inserted between the lips. Mr David Forbes has suggested the use of a double jet-pipe in connection with this instrument, so that a large or small orifice may be obtained without stopping the point; but it is doubtful whether the advantage gained is counterbalanced by the extra cost and complication. For the majority of blowpipe workers, there is probably no better instrument than Dr Black's, if provided with a properly-shaped nozzle, if possible of platinum; but where it is much used, the large-sized trumpet-mouthed instrument of Plattner is to be preferred. The instrument should be held with the first and fourth fingers passed round it, and the thumb laid along the side of the tube, the hold being steadied by resting

the elbow on the table. The mode of blowing is peculiar, and requires some practice, an uninterrupted blast is kept up by the muscular action of the cheeks, while the ordinary respiration goes on through the nostrils.

If the flame of a candle or lamp be closely examined, it will be seen to consist of four parts—(a) a deep blue ring at the base, (b) a dark cone in the centre, (c) a luminous portion round this, and (d) an exterior pale blue envelope. The blue ring is formed chiefly by combustion of carbonic oxide. In the central cone the combustible vapours from the wick, though heated, are not burned, atmospheric oxygen not reaching it. In the luminous portion the supply of oxygen is not sufficient for complete combustion, the hydrogen takes up all or most of it, and carbon is precipitated in solid particles and ignited. In the exterior envelope, lastly, the temperature is highest, and combustion most complete,—sufficient oxygen being supplied to convert the carbon and hydrogen into water and carbonic acid.

In blowpipe work only two of these four parts are made use of, viz., the pale envelope, for *oxidation*, and the luminous portion, for *reduction*. To obtain a good *oxidizing flame*, the blowpipe is held with its nozzle inserted in the edge of the flame close over the level of the wick and blown into gently and evenly. A conical jet is thus produced, consisting of an inner cone, with an outer one commencing near its apex:—the former, corresponding to (a) in the free flame, blue and well defined; the latter, corresponding to (d), pale blue and vague. The heat is greatest just beyond the point of the inner cone, combustion being there most complete. Oxidation is better effected (if a very high temperature be not required) the farther the substance is from the apex of the inner cone, so far as the heat proves sufficient, for the air has thus freer access.

To obtain a good *reducing flame* (in which the combustible matter, very hot, but not yet burned, is disposed to take oxygen from any compound containing it), the nozzle, with smaller orifice, should just touch the flame at a point higher above the wick, and a somewhat weaker current of air should be blown. The flame then appears as a long, narrow, luminous cone,—the end being enveloped by a dimly visible portion of flame corresponding to that which surrounds the free flame, while there is also a dark nucleus about the wick. The substance to be reduced is brought into the luminous portion, where the reducing power is strongest.

The flame of an oil-lamp is the best for blowpipe operations where gas is wanting, candle flame may be used when great heat is not required. The blowpipe lamp of Berzelius, supplied with colza oil, is probably the most suitable. The wick, when in use, should be carefully trimmed and clean, so as to avoid a smoking flame. The general introduction of gas has quite driven out the use of oil-lamps for blowpipe purposes in laboratories.

Various materials are used as supports for substances in the blowpipe flame; the principal are charcoal, platinum, and glass. *Charcoal* is valuable for its infusibility and low conductivity for heat (allowing substances to be strongly heated upon it), and for its powerful reducing agency by the production of carbonic oxide when ignited, so that it is chiefly employed in trying the fusibility of minerals, and in reduction. The best kind of charcoal is that of close-grained pine or alder, it is cut in short prisms, having a flat smooth surface at right angles to the rings of growth. In this a shallow hole is made with a knife or borer, for receiving the substance to be held in the flame. *Platinum* is employed in oxidizing processes, and in fusion of substances with fluxes with a view to try their solubility in them, and note the phenomena of the bead; also in observing the colouring effect of substances on the blowpipe flame (which effect is apt to be somewhat masked

by charcoal. Most commonly it is used in the form of wire, with a small bead, or loop at the end. In flux experiments this loop is dipped when ignited in the powdered flux (e.g., borax), then held in a lamp flame till the powder is fused; and the process is repeated, if necessary, till the loop is quite filled with a bead of the flux; to this is now added a little of the substance to be examined. Platinum is also used in the form of foil and of spoons, and for the points of forceps. Metals and easily reducible oxides, sulphides, or chlorides should not be treated upon platinum, as these substances may combine with and damage it. Tubes of hard German glass, 5 to 6 inches long, about  $\frac{1}{8}$ th inch diameter, and open at both ends, are useful in the examination of substances containing sulphur, selenium, arsenic, antimony, and tellurium; these, when heated with access of air, evolve characteristic fumes. They are put in the tube near one end (which is held slightly depressed), and subjected to the blowpipe flame. The sublimes often condense on the cooler parts of the tube. Small tubes, closed at one end, are used, where it is required to detect the presence of water, mercury, or other bodies which are volatilized by heat without access of air.

The most important fluxes used in blowpipe analysis are carbonate of sodium, borax, and microcosmic salt. The first (which must be anhydrous and quite free from sulphates) serves chiefly in reducing metallic oxides and sulphides on charcoal, decomposing silicates, determining the presence of sulphur, and discriminating between lime and other earthy bases in minerals. Pure borax, or acid borate of sodium deprived of its water of crystallization by heating, is used for the purpose of dissolving up metallic oxides, when in a state of fusion at a red heat, such fused masses usually having characteristic colours when cold. In some cases the colour and transparency change on cooling. *Microcosmic salts*, or ammonio-phosphate of sodium, is used on platinum wire in the same way as borax; on heating, water and ammonia are given off. The following are some other reagents for certain cases—nitrate of potash, bisulphate of potash, nitrate of cobalt, silica, fluoride of calcium, oxide or oxalate of nickel, protoxide of copper, tin foil, fine silver, dry chloride of silver, bone ash, and litmus and Brazil-wood paper.

It may be useful here to pass briefly under review a few of the effects obtained in qualitative examinations with the blowpipe. Beginning with the *closed tube*, organic substances may be revealed by the empyreumatic odour given off, and by charring. Mercury condenses on the tube in minute globules. Selenium gives a reddish-brown, tellurium a grey, arsenic a black sublimate. Oxygen is sometimes given off, and will inflame an incandescent splinter of wood when introduced; while ammonia may be detected by red litmus paper, as also the acid or alkaline reaction of any liquid product. In the *open tube*, sulphur and sulphides give off pungent-smelling sulphurous acid gas. Selenium gives a steel-grey deposit, and an odour resembling that of horse radish. Arsenic, antimony, tellurium, yield their respective acids, forming white sublimes. The deposit from arsenic is crystalline, that from the others amorphous. In examination on charcoal, it is useful, in practice, to commence with pure materials and familiarize one's self with their phenomena. Most of the metals fuse in the heat of the blowpipe flame; and in the outer flame they oxidize. The noble metals do not oxidize, but they fuse. The metals platinum, iridium, rhodium, and palladium do not fuse. The incrustations (when such occur) are in each case characteristic, both in aspect and in the effects they give before the blowpipe flame. Among the most common oxides capable of reduction on charcoal alone, in the

inner flame, are those of zinc, silver, lead, copper, bismuth, and antimony. The principal minerals that cannot be so reduced are those containing alkalies and alkaline earths, and the oxides of iron, manganese, and chromium. Many substances give a characteristic colour, when held by platinum forceps in the oxidizing flame. For example, arsenic, antimony, lead, colour the flame blue; copper, baryta, zinc, green; lime, lithia, strontia, red; potash, violet. Heated with borax, some bodies give a clear bead, both while hot and cold, except when heated by the intermittent oxidizing flame, or the flame of reduction, when the bead becomes opalescent, opaque, or milky white. The alkaline earths, tantalum and titanic acids, yttria and zirconia are examples of this. The oxides of most of the heavy metals give coloured glasses with borax, similar to those obtained by their use in glass or enamel painting. Thus oxide of cobalt gives a showy blue, and oxide of nickel a reddish-brownish colour, both being very characteristic and delicate tests of the presence of these metals. Ferric oxide gives a feeble yellow colour, which is darker while hot; but when the bead so coloured is treated in the reducing flame the iron passes into the state of ferrous oxide, giving an intensely green or nearly black colour. This reaction may be more certainly brought about by touching the bead while melted with a fragment of tin, when the ferric oxide is probably reduced at the expense of the metal. With manganese the reverse effect is produced. A bead containing a considerable quantity of manganous oxide, such as is produced by a clean reducing flame, is colourless, but when treated in the oxidizing flame the showy violet colour of the higher oxide is brought out. This reaction is a very delicate one, and is to be recommended to beginners as a test exercise in blowing a clean flame, the bead being rendered alternately coloured and colourless according as the oxidizing or reducing flame is used. Molybdic acid, which gives a black bead in the reducing, and a clear bead in the oxidizing flame, but requires more careful management, was usually recommended by Plattner to his students for this kind of exercise. Copper salts give a green bead in the oxidizing and a deep sealing-wax red in the reducing flame. This latter indication is of value in detecting a trace of copper in the presence of iron, which is done by reducing with tin as already described for iron. The effects obtained with beads of microcosmic salt, or as it is more generally called *salt of phosphorus*, are generally similar to those described for borax, but in certain cases it is to be preferred, especially in the detection of silica, which remains undissolved, and titanic acid, which can be made to assume the form of crystals similar to the natural mineral anatase by particular treatment and microscopic examination. Several new phenomena, due to the crystallization of titanic acid and similar bodies, have been described by Gustav Rose.

With carbonate of sodium as flux (a paste of which and the substance to be examined is made with water, and held on charcoal to the flame), three reactions may occur. The substance may fuse with effervescence, or it may be reduced, or the soda may sink into the charcoal, leaving the substance intact on the surface. The first takes place with silica, and with titanic and tungstic acids. The oxides of tungsten, antimony, arsenic, copper, mercury, bismuth, tin, lead, zinc, iron, nickel, and cobalt are reduced. Lead, zinc, antimony, bismuth, cadmium, and tellurium are volatilized partially, and form sublimes on the charcoal. Mercury and arsenic are dissipated as soon as reduced. Silica and titanic acid are the only two substances that produce a clear bead. The bead in which silica is fused is sometimes rendered yellow by the presence of sulphur. Carbonate of soda, with addition of a little nitrate of potassa, is very useful for detecting minute quantities of manganese. The fused mass, when clear, has, from the production of man-

<sup>1</sup> In a paper to the Royal Society, Captain Ross points out that it is better to use boric acid and phosphoric acid, instead of borax and microcosmic salts, for various analyses.

ganate of sodium, a fine green colour. (For particulars of the behaviour of different minerals before the blowpipe, see the detailed description in the article MINERALOGY.) Of late years the spectroscope has been successfully used in connection with blowpipe operations, in the detection of certain of the rarer metallic elements.

The blowpipe was first applied in the quantitative determination of metals by Harkort in 1827, and was brought to a high degree of perfection by Plattner. The methods are substantially those adopted in the assay of ores on the large scale in the wind furnace or muffle, thin capsules of clay or cavities in charcoal blocks being substituted for crucibles, and steel basins faced with bone ash, for cupels, in silver and gold assaying. From the small size of the beads obtained, especially when the ores of the precious metals are operated upon, the results are often such as cannot be weighed, and they are then measured by a tangent scale, and the weight computed from the observed diameter. This method, devised by Harkort, gives very accurate results when carefully used, but owing to the difficulty of sampling the minute quantities operated upon so as to represent the bulk of the mineral fairly, the quantitative blowpipe assay has not made much progress. Perhaps the most useful quantitative application is in the determination of nickel and cobalt. This depends upon the fact that when the compounds of these metals, as well as those of copper and iron, with arsenic, are melted in contact with an oxidizing flux, such as borax or salt of phosphorus, iron is first taken up, then cobalt, and next nickel, and finally copper; and as the oxides of these metals give very different colours to the flux, we are enabled by examining the slag to detect the exact moment at which each is removed. For the details of the process the reader is referred to Plattner's work.

Among the various arrangements which have been contrived for supplying air to the blowpipe otherwise than with the mouth, we may select that represented in the annexed figure (2) as one which is generally sufficient for

FIG. 2.—Blowpipe with Bellows

practical purposes. It will be seen that the jet *i* is supported on a slide which can be fixed by screwing in any direction and at any height on the rod *s*, which is jointed on the board *b*. The blast can thus be adjusted variously, according to the position given to the blowpipe lamp *a*, which is of the form devised by Berzelius. The bellows *B*, the tube *k*, and the reservoir *R*, are of vulcanized india-rubber, *v* and *v'* are valves. The bellows being alternately compressed (with hand or foot) and allowed to expand, air is driven into the reservoir, and a fresh supply admitted into the bellows through *v*. After a few trials a constant blast may thus be maintained through the nozzle.

For glass-blowing ordinary coal gas is the best combustible, as the flame can be well controlled by a stop-cock, and requires no trimming. The nature of the apparatus will be understood from fig. 3, which shows the burner in horizontal section.

The tube *ab* is screwed into another tube which is connected with the gas pipe *ef*; *mn* and *op* are two annular disks which support the pipe *ab*; they have a series of openings round their edges, to admit a uniform flow of gas to the narrow annular mouth between the two tubes where it joins the blast. The stop-cock *f* regulates the supply of gas. The wind, supplied by double bellows fixed under the table, is sent through a lead pipe on which brass nozzles of various width can be screwed, opening into *ab*; the finer nozzles being pushed up nearly to the end of this. Elastic tubing may sometimes be used with advantage for the connections. A modified form of the apparatus is suitable for ordinary blowpipe

FIG. 3.—Section of Blowpipe for Glassblowing.

researches of the mineralogist or chemist (see Plattner's work, 4th edition), and the apparatus used in hand-soldering of metals and other operations of the workshop is on the same principle. With suitable trunnions the blowpipe may be made to point in any direction as required.

The soldering lamp of tinner's is an example of the æolipile, an instrument which deserves some notice here. The spirit lamp *a* (fig. 4) is inserted at the bottom of a sheet-iron cylinder *MN*, which is open on one side, as shown. The upper part of the cylinder supports a strong cup of hammered metal, with an opening for spirits at the top (closed by a screw or cock), and a bent tube coming down from its upper part, through a slit in the cylinder to the back of the flame. The weak spirits which are put in the cup are caused to boil by the heat of the lamp, and the vapour, escaping through the bent tube, produces a jet of very hot flame. (The cup is shown separately in fig. 5). Similar advantage is gained by causing air to pass through a quantity of some soluble hydrocarbon before it goes to the nozzle of a blowpipe.

FIG. 4.—Soldering Lamp.

FIG. 5.—Cap of fig. 4.

There are several forms of apparatus in which water-pressure is utilized for supplying a steady blast to the blowpipe. One of these consists of a tin case, with an oblique partition reaching nearly to the bottom. The case is filled nearly three-fourths with water. Air is blown into the compartment which narrows upwards (and with which the nozzle is connected above) by a pipe reaching nearly to the bottom. This air rises through the water and accumulates above it, forcing the water up into the other compartment, which communicates freely with the outer air. The difference of water-level in the two cham-

bers thus sustains a continuous blast through the nozzle. Blowpipes have also been made on the principle of the blowing-machine known as the *trompe*. Again, the blast is sometimes supplied from a chamber in which air is condensed by means of a syringe.

The absorption of heat when an ordinary blast of cold air (with its large proportion of nitrogen) is sent into a flame is considerable; and this has suggested the employment of a hot blast for blowpipe work. Mr T. Fletcher has constructed an apparatus on this principle, which yields a very intense flame, sufficient to fuse platinum wire. The arrangement is represented in fig 6. It will be observed that the pipe conveying the blast is coiled several times round the gas pipe (for ordinary coal-gas), and that both coil and core are heated by a row of burners placed below. The blast is furnished either with the mouth or with india-rubber bellows.

FIG. 6.—Hot-Blast Blowpipe.

The power of the blowpipe flame may be greatly increased by supplying oxygen in the place of atmospheric air, and a still greater heat is obtained by the combination of pure oxygen and hydrogen. In the latter arrangement, which constitutes the oxyhydrogen blowpipe, it is important that the oxygen and hydrogen be kept in separate reservoirs, and be only allowed to mix at the jet, otherwise explosion may occur through the flame running back through the jet to the reservoir of mixed gases. There are various methods of effecting this, which we do not stop to describe. The blue flame produced gives the most intense heat that is obtainable by artificial means, except by the electric current. Thick platinum wires are melted before it like wax in a candle flame; and earths, such as lime, magnesia, or zirconia, are raised to intense incandescence. For the application of the oxyhydrogen blowpipe to the fusion of the more refractory metals, see PLATINUM.

The literature of the blowpipe is very extensive. The earlier notices of the subject will be found in Berzelius's original work, of which there are English translations by Children, published in 1822, and by J. D. Whitney (of a later edition), published in Boston in 1845. The most complete work, however, is Plattner's *Probirkunst mit dem Löthrohre*, of which there are several editions; the fourth or latest, published since the author's death, has been edited by his pupil and successor, Professor Richter of Freiberg. An English translation, by Professor H. B. Cornwall, has been published in New York. For the use of the blowpipe in determining minerals, the best works are Scheerer's *Löthrohrbuch*, translated by Professor H. B. Blanford, and a *Manual of Determinative Mineralogy, with an Introduction to Blowpipe Analysis*, by Professor G. J. Brush of Yale College. In addition to these works, notices, more or less extensive, will be found in most mineralogical handbooks and works on chemical analysis. (A. B. M.)

BLÜCHER, GEDHARD LEBERFICHT VON, field-marshal of the Prussian armies, prince of Wahlstadt in Silesia, was born at Rostock in 1742. In his fourteenth year he entered into the service of Sweden; and in the war between that power and Prussia he was taken prisoner. He afterwards entered into the service of Prussia, in which he became distinguished by his activity; but conceiving himself neglected by the great Frederick, he became a farmer

in Silesia, and by his enterprise and perseverance in fifteen years he acquired an honourable independence. On the accession of Frederick-William II. he was recalled to military service, and replaced as major in his old regiment, the Black Hussars, where he distinguished himself in six general actions against the French, rose to the rank of colonel and major-general in 1793-4, and gained a high reputation by his energy, promptitude, and foresight. He was in a subordinate command in the disastrous battle of Jena in 1802; but he made a masterly retreat with his column to Lubeck, and extorted the praises of his adversaries, who testified on his capitulation that it was caused by "want of provisions and ammunition." He was soon exchanged for General Victor, and was actively employed in Pomerania, at Berlin, and at Königsberg, until the conclusion of the war. When Prussia shook off the French yoke in 1813, he first obtained a separate command. At the head of 60,000 troops, chiefly composed of raw militia, he defeated four French marshals at Katsbach, and rapidly crossing the Elbe, materially contributed to the signal victory of Leipzig. In several severe actions he fought his way to Paris, which he entered on 31st March 1814; and there, it has been stated, but for the intervention of the other allied commanders, he was disposed to make a severe retaliation for the calamities that Prussia had suffered from the armies of France. Blowing up the bridge of Jena across the Seine was said to be one of his contemplated acts. When war again broke out in 1815, the veteran was at the head of the Prussian armies in Belgium, and exhibited his wonted enterprise and activity. But partly owing to his own confidence and temerity, partly to the skilful strategy of his celebrated opponent, he was defeated in the severe battle of Ligny on 16th of June; yet, with his characteristic spirit and energy, Blücher rallied his defeated forces, and appeared on the field of Waterloo on the 18th, just as Wellington had repulsed the last attack of Napoleon on the British position. At that critical moment Blücher was seen emerging from the wood of Frichemont on the French right; and the simultaneous irresistible charge of the British forces converted the retreat of the French into a tumultuous flight. The allied commanders met on the Genappes road, near the farm called Maison du Roi, where the British forces were halted. The pursuit was continued through the night by sixteen fresh Prussian regiments with terrible carnage. The allies soon again entered Paris, where Blücher remained for several months; but the health of the aged commander having declined, he retired to his Silesian residence at Kirlowitz, where he died on the 12th September 1819, aged seventy-seven. The life of Blücher has been written by Varnhagen von Ense (1827), Rauschnick (1836), Biesko (1862), and Scherr (1862).

BLUMENBACH, JOHANN FRIEDRICH, a distinguished physiologist, was born at Gotha on the 11th of May 1752. He studied medicine at Jena, and afterwards at Göttingen, where he took the degree of doctor in 1775. His thesis on that occasion *De Generis Humani Varietate Nativa*, published in quarto, was the germ of those cranio-logical researches to which so many of his subsequent inquiries were directed; and such was the opinion entertained of his acquirements, that he was appointed an adjunct or extraordinary professor of medicine in the following year, and ordinary professor in 1778; soon after which period he began to enrich the pages of the *Medicinishe Bibliothek*, of which he was editor from 1780 to 1794, with various contributions on medicine, physiology, and anatomy. In physiology he was of the school of Haller, and was in the habit of illustrating his theory by a careful comparison of the animal functions of man with those of the lower animals. His reputation was much extended by

the publication of his excellent *Institutiones Physiologicae*, a condensed, well-arranged view of the animal functions, expounded without discussion of minute anatomical details. This work appeared in 1787, and between its first publication and 1821 went through many editions in Germany, where it was the general text-book of the science. It was translated into English in America by Caldwell in 1798, and in London by Elliotson in 1807.

Blumenbach was perhaps still more extensively known by his admirable *Handbuch* of comparative anatomy, of which the German editions were numerous, from its appearance in 1805 to 1824. It was translated into English in 1809 by the eminent surgeon Lawrence, and again, with the latest improvements and editions, by Coulson in 1827. This manual of Blumenbach's, though slighter than the subsequent works of Cuvier, Carus, and others, and not to be compared with such recent expositions as that of Gegenbaur, will always be esteemed for the accuracy of the author's own observations, and his just appreciation of the labours of his predecessors.

One of the most extensive of Blumenbach's works was the *Decas Collectionis suæ Craniorum Diversarum Gentium illustrata*, in which accurate though slight delineations of the skulls in his noble collection are given, with brief descriptions of each. It appeared in *fasciculi*, until sixty crania were represented,—exhibiting in a striking manner the peculiarities in form of the skulls of different nations, and justifying the division of the human race into several great varieties or families, of which he enumerated five—the Caucasian or white race, the Mongolian or Tatar, the Malayan or brown race, the Negro or black race, and the American or red race. The classification he thus proposed has been very generally received, and most later schemes have been modifications of it. For these see the article ANTHROPOLOGY, vol. ii. p. 113.

Although the greatest part of Blumenbach's long life was passed at Göttingen, in 1789 he found leisure to visit Switzerland, and gave a curious medical topography of that country in his *Bibliothek*. He was in England in 1788 and 1792. The Prince Regent conferred on him the office of physician to the royal family in Hanover in 1816, and made him knight companion of the Guelphic order in 1821. The Royal Academy of Paris elected him a member in 1831. He died at Göttingen on the 22d of January 1840.

BOA, a name formerly applied to all large Serpents, which, devoid of poison fangs, killed their prey by constriction; but now confined to that section of them occurring in America, the Old World forms being known as Pythons. The true boas are widely distributed throughout tropical America, occurring most abundantly in Guiana and Brazil, where they are found in dry sandy localities, amid forests, on the banks of rivers and lakes, and in the water itself, according to the habits of the various species. They feed chiefly on the smaller quadrupeds, in search of which they often ascend trees, suspending themselves from the branches by the tail, and thus awaiting motionless the approach of their victim. While so hanging they are partly supported by two spine-like hooks, situated one on each side of the vent, which are connected with several small bones concealed beneath the skin and attached to the main skeleton. These bones, terminating thus in an external claw, are characteristic of the family *Boidæ*, and are recognized by anatomists as the rudiments of those which form the hind limbs in all quadrupeds. The size of the boa's prey often seems enormously beyond its apparent capacity for swallowing, a difficulty which disappears on acquaintance with the peculiar structure of the creature's jaws. The bones composing these are not knit together as in Mammals, but are merely connected by ligaments, which

can be distended at pleasure. The mouth of the boa can thus be made to open transversely as well as vertically; and in addition to this the two jaws are not connected directly as in other animals, but by the intervention of a distinct bone, which adds greatly to the extent of its gape. It has also the power of moving one half of the jaw independently of the other, and can thus keep a firm hold of its victim while gradually swallowing it. The boa possesses a double row of solid sharp teeth in the upper jaw, and a single row beneath, all pointing inwards, so that, its prey once caught, it would be well-nigh impossible even for the boa itself to release it. After feeding, boas, like all other reptiles, become inactive, and remain so while the process of digestion is going on, which, in the case of a full meal, may extend over a few weeks, and during this period they are readily killed. All the species are ovoviviparous. The Jiboya or *Boa constrictor*—the latter name having been loosely given to all the species—is an inhabitant of the dry and sandy districts of tropical America, and rarely exceeds 20 feet in length. Its food consists chiefly of the agoutis, capybaras, and ant-bears, which abound in those districts. It seeks to avoid man, and is not feared by the inhabitants, who kill it readily with a sharp blow from a stick. The Water-Boa or Anaconda (*Eunectes murinus*) is a much more formidable creature, attaining, it is said, a length of 40 feet, and being thus probably the largest of living serpents. It inhabits the lakes, rivers, and marshes of Brazil and Guiana, and passes a considerable portion of its existence in the water. It is exceedingly voracious, feeding on fishes and on such animals as may come to the banks of the stream to drink, for which it lies in wait with only a small part of its head above the surface of the water. It also occasionally visits the farmyards, carrying off poultry and young cattle, and it has been known to attack man.

BOADICEA, a British queen in the time of the Emperor Nero. She was wife of Prasutagus, king of the Iceni, a people inhabiting the eastern coast of Britain. On his deathbed, 60 A.D., Prasutagus named the emperor heir to his accumulated treasures conjointly with his own two daughters, in expectation of securing thereby Nero's protection for his family and people; but he was no sooner dead than the emperor's officers seized all. Boadicea's opposition to these unjust proceedings was resented with such cruelty, that orders were given that she should be publicly whipped, and her daughters exposed to the brutality of the soldiers. The Britons took up arms, with Boadicea at their head, to shake off the Roman yoke; the colony of Camalodunum or Colchester was taken, and the Romans were massacred wherever they could be found. The whole province of Britain would have been lost to Rome, if Suetonius Paulinus had not hastened from the Isle of Mona, and at the head of 10,000 men engaged the Britons, who are said to have amounted to 230,000. A great battle was fought, which resulted in the complete defeat of the Britons (62 A.D.) Boadicea, who had displayed extraordinary valour, soon after despatched herself by poison. (Tac. *Ann.* xiv. *Agric.*, 15-16; Dion Cass. lxxii.)

BOAR, WILD (*Sus scrofa*), an important species of *Suida*, a family of Pachydermatous Mammals, and generally regarded as the original stock of our domestic breeds of swine. In size it is equal to the largest of the domestic kinds, while exceeding them all in strength of body and in ferocity of disposition. It is of a greyish-black colour, covered with short woolly hair, thickly interspersed with coarse stiff bristles, which assume the form of a mane along the spine. The canine teeth are largely developed, forming two pairs of prism-shaped tusks, which thus become formidable weapons. In old age those tusks in the lower jaw gradually curve inwards and upwards over

the snout until they are rendered useless for purposes of attack, when, according to Darwin, they become serviceable for defence in the frequent fights which take place during the rutting season. At the same time, the canines of the upper jaw begin to develop outwards and upwards, and these take the place of the lower ones as offensive weapons. The wild boar is a native of the temperate regions of Europe and Asia, where it inhabits the deepest recesses of forests and marshy grounds. Vambéry, in his recent journey through Central Asia, found them in enormous numbers in the extensive swamps of Turkestan. They appear to have been denizens of British forests at least till the reign of Henry II., after which they are not heard of till the time of Charles I., when an attempt to restock the New Forest with them failed. In the reign of William the Conqueror any one killing a wild boar was liable to have his eyes put out. After reaching maturity the boar becomes a solitary animal, unless during the breeding season, when it seeks the female, and at this time they engage in fierce contests with each other, although these, it is said, seldom lead to fatal results, as they contrive to receive the blows on their tusks, or on the specially tough skin which covers their shoulders. The Indian Wild Boar (*Sus indicus*) is undoubtedly polygamous, and there are several facts which point to a similar habit in the European boar. Both species are nocturnal, issuing from their coverts at twilight in quest of food. This is chiefly of a vegetable nature, consisting of roots which it ploughs up by means of its broad muscular snout and of grain; although they are also known to devour the smaller mammals, birds, and eggs. The female is ordinarily a timid creature, but shows great courage and fierceness in defence of its young. It associates with other females for mutual protection against wolves. The wild boar was for many centuries a favourite beast of chase with the nobility of Europe. It was hunted on foot with the spear,—its great strength, and its ferocity when at bay, rendering the sport alike exciting and dangerous. The gun has now superseded the spear in European boar-hunting, but owing to the comparative scarcity of the boars it is now little practised. In India, however, where these animals abound in the jungles, it is still a favourite sport, the boar being pursued on horseback and speared. The bristles of the boar are much used in the manufacture of brushes.

**BOAT-BUILDING.** See **SHIP-BUILDING.**

**BOBRUISK**, a town of Russia, in the government of Minsk, 110 miles S.E. of that city, in 53° 15' N. lat. and 28° 52' E. long., on the right bank of the Berezina, near the confluence of the Bobruiska, on the high road from Mogileff to Brest-Litovsk. Bobruisk was an unimportant place in 1508, when the Moscovite army, sent by the Emperor Basil against the Polish king Sigismund, advanced towards it. In the 17th century there existed a castle, which was burned down in 1649. When the Minsk government was incorporated with Russia, Bobruisk was a small borough; but in 1795 it was raised to the rank of chief town of a department in the Minsk government. In the beginning of the reign of Alexander I. there was erected at Bobruisk, by the advice of General Osterman, a fort, which obtained great importance in 1812, and was made equal to the best in Europe by the Emperor Paul I. The fort proper is built on a height exactly at the confluence of the Bobruiska with the Berezina, nearly a mile from the town. On the right bank of the former river is another small fort, called Fort Frederick William, well supported by a line of defences. In 1860 the population of Bobruisk was 23,761, of whom 11,394 were Jews. It has 2 Greek churches, 17 synagogues, a military hospital, and a departmental college. The only industrial establishments are two potteries. On the river near the town there is a har-

bour, by which grain and salt are imported from the southern governments.

**BOCCACCIO, GIOVANNI.** Comparatively little is known of Boccaccio's life, particularly of the earlier portion of it. He was born in 1313, as we know from a letter of Petrarch, in which that poet, who was born in 1304, calls himself the senior of his friend by nine years. The place of his birth is somewhat doubtful,—Florence, Paris, and Certaldo being all mentioned by various writers as his native city. Boccaccio undoubtedly calls himself a Florentine, but this may refer merely to the Florentine citizenship acquired by his grandfather. The claim of Paris has been supported by Baldelli and Tiraboschi, mainly on the ground that his mother was a lady of good family in that city, where she met Boccaccio's father. The balance of evidence is decidedly in favour of Certaldo, a small town or castle in the valley of the Elsa, 20 miles from Florence, where the family had some property, and where the poet spent much of the latter part of his life. He always signed his name Boccaccio da Certaldo, and named that town as his birthplace in his own epitaph. Petrarch calls his friend Certaldese; and Filippo Villani, a contemporary, distinctly says that Boccaccio was born in Certaldo.

Boccaccio, an illegitimate son, as is put beyond dispute by the fact that a special licence had to be obtained when he desired to become a priest, was brought up with tender care by his father, who seems to have been a merchant of respectable rank. His elementary education he received from Giovanni da Strada, an esteemed teacher of grammar in Florence. But at an early age he was apprenticed to an eminent merchant, with whom he remained for six years, a time entirely lost to him, if we may believe his own statement. For from his tenderest years his soul was attached to that "*alma poësis*," which, on his tombstone, he names as the task and study of his life. In one of his works he relates that, in his seventh year, before he had ever seen a book of poetry or learned the rules of metrical composition, he began to write verse in his childish fashion, and earned for himself amongst his friends the name of "the poet." It is uncertain where Boccaccio passed these six years of bondage; most likely he followed his master to various centres of commerce in Italy and France. We know at least that he was in Naples and Paris for some time, and the youthful impressions received in the latter city, as well as the knowledge of the French language acquired there, were of considerable influence on his later career. Yielding at last to his son's immutable aversion to commerce, the elder Boccaccio permitted him to adopt a course of study somewhat more congenial to the literary tastes of the young man. He was sent to a celebrated professor of canon law, at that time an important field of action both to the student and the practical jurist. According to some accounts—far from authentic, it is true—this professor was Cino da Pistoia, the friend of Dante, and himself a celebrated poet and scholar. But, whoever he may have been, Boccaccio's master was unable to inspire his pupil with scientific ardour. "Again," Boccaccio says, "I lost nearly six years. And so nauseous was this study to my mind, that neither the teaching of my master, nor the authority and command of my father, nor yet the exertions and reproof of my friends, could make me take to it, for my love of poetry was invincible."

About 1333 Boccaccio settled for some years at Naples, apparently sent there by his father to resume his mercantile pursuits, the canon law being finally abandoned. The place, it must be confessed, was little adapted to lead to a practical view of life one in whose heart the love of poetry was firmly rooted. The court of King Robert of Anjou at Naples was frequented by many Italian and French men of letters, the great Petrarch amongst the

number. At the latter's public examination in the noble science of poetry by the king, previous to his receiving the laurel crown at Rome, Boccaccio was present,—without, however, making his personal acquaintance at this period. In the atmosphere of this gay court, enlivened and adorned by the wit of men and the beauty of women, Boccaccio lived for several years. We can imagine how the tedious duties of the market and the counting-house became more and more distasteful to his aspiring nature. We are told that finding himself by chance on the supposed grave of Virgil, near Naples, Boccaccio on that sacred spot took the firm resolution of devoting himself for ever to poetry. But perhaps another event, which happened some time after, led quite as much as the first mentioned occurrence to this decisive turning point in his life. On Easter-eve, 1341, in the church of San Lorenzo, Boccaccio saw for the first time the natural daughter of King Robert, Maria, whom he immortalized as Fiammetta in the noblest creations of his muse. Boccaccio's passion on seeing her was instantaneous, and (if we may accept as genuine the confessions contained in one of her lover's works) was returned with equal ardour on the part of the lady. But not till after much delay did she yield to the amorous demands of the poet, in spite of her honour and her duty as the wife of another. All the information we have with regard to Maria or Fiammetta is derived from the works of Boccaccio himself, and owing to several apparently contradictory statements occurring in these works, the very existence of the lady has been doubted by commentators, who seem to forget that, surrounded by the chattering tongues of a court, and watched perhaps by a jealous husband, Boccaccio had all possible reason to give the appearance of fictitious incongruity to the effusions of his real passion. But there seems no more reason to call into question the main features of the story, or even the identity of the person, than there would be in the case of Petrarch's Laura or of Dante's Beatrice. It has been ingeniously pointed out by Baldelli, that the fact of her descent from King Robert being known only to Maria herself, and through her to Boccaccio, the latter was the more at liberty to refer to this circumstance,—the bold expression of the truth serving in this case to increase the mystery with which the poets of the Middle Ages loved, or were obliged, to surround the objects of their praise. From Boccaccio's *Ameto* we learn that Maria's mother was, like his own, a French lady, whose husband, according to Baldelli's ingenious conjecture, was of the noble house of Aquino, and therefore of the same family with the celebrated Thomas Aquinas. Maria died, according to his account, long before her lover, who cherished her memory to the end of his life, as we see from a sonnet written shortly before his death.

The first work of Boccaccio, composed by him at Fiammetta's command, was the prose tale, *Filocolo*, describing the romantic love and adventures of Florio and Biancafiore, a favourite subject with the knightly minstrels of France, Italy, and Germany. The treatment of the story by Boccaccio is not remarkable for originality or beauty, and the narrative is encumbered by classical allusions and allegorical conceits. The style also cannot be held worthy of the future great master of Italian prose. Considering, however, that this prose was in its infancy, and that this was Boccaccio's first attempt at remoulding the unwieldy material at his disposal, it would be unjust to deny that *Filocolo* is a highly interesting work, full of promise and all but articulate power.

Another work, written about the same time by Fiammetta's desire and dedicated to her, is the *Teseide*, an epic poem, and indeed the first heroic epic in the Italian language. The name is chosen somewhat inappropriately, as King Theseus plays a secondary part, and the interest of

the story centres in the two noble knights, Palemone and Arcito, and their wooing of the beautiful Emelia. The *Teseide* is of particular interest to the student of poetry, because it exhibits the first example of the *ottava rima*, a metre which has been adopted by Tasso and Ariosto, and in our own language by Byron in his *Don Juan*. Another link between Boccaccio's epic and our literature is formed by the fact of Chaucer having in the *Knight's Tale* adopted its main features.

Boccaccio's poetry has been severely criticized by his countrymen, and most severely by the author himself. On reading Petrarch's sonnets, Boccaccio resolved in a fit of despair to burn his own attempts, and only the kindly encouragement of his great friend prevented the holocaust. Posterity has justly differed from the author's sweeping self-criticism. It is true, that compared with Dante's grandeur and passion, and with Petrarch's absolute mastery of metre and language, Boccaccio's poetry seems to be somewhat thrown into shade. His verse is occasionally slipshod, and particularly his epic poetry lacks what in modern parlance is called poetic diction,—the quality, that is, which distinguishes the elevated pathos of the recorder of heroic deeds from the easy grace of the mere *conteur*. This latter feature, so charmingly displayed in Boccaccio's prose, has to some extent proved fatal to his verse. At the same time, his narrative is always fluent and interesting, and his lyrical pieces, particularly the poetic interludes in the *Decameron*, abound with charming gallantry, and frequently rise to lyrical pathos.

About the year 1341 Boccaccio returned to Florence by command of his father, who in his old age desired the assistance and company of his son. Florence, at that time disturbed by civil feuds, and the silent gloom of his father's house could not but appear in an unfavourable light to one accustomed to the gay life of the Neapolitan court. But more than all this, Boccaccio regretted the separation from his beloved Fiammetta. The thought of her at once embittered and consoled his loneliness. Three of his works owe their existence to this period. With all of them Fiammetta is connected; of one of them she alone is the subject.

The first work, called *Ameto*, describes the civilizing influence of love, which subdues the ferocious manners of the savage with its gentle power. Fiammetta, although not the heroine of the story, is amongst the nymphs who with their tales of true love soften the mind of the huntsman.

*Ameto* is written in prose alternating with verse, specimens of which form occur in old and middle-Latin writings. It is more probable, however, that Boccaccio adopted it from that sweetest and purest blossom of mediæval French literature, *Aucassin et Nicolette*, which dates from the 13th century, and was undoubtedly known to him. So pleased was Boccaccio with the idea embodied in the character of *Ameto* that he repeated its essential features in the Cimone of his *Decameron* (Day 5th, tale i.)

The second work referred to is a poem in fifty chapters, called *L'amorosa visione*. It describes a dream in which the poet, guided by a lady, sees the heroes and lovers of ancient and mediæval times. Boccaccio evidently has tried to imitate the celebrated *Trionfi* of Petrarch, but without much success. There is little organic development in the poem, which reads like the *catalogue raisonné* of a picture gallery; but it is remarkable from another point of view. It is perhaps the most astounding instance in literature of ingenuity wasted on trifles; even Edgar Poe, had he known Boccaccio's puzzle, must have confessed himself surpassed. For the whole of the *Amorosa visione* is nothing but an acrostic on a gigantic scale. The poem

is written, like the *Divina Commedia*, in *tersa rima*, and the initial letters of all the triplets throughout the work compose three poems of considerable length, in the first of which the whole is dedicated to Boccaccio's lady-love, this time under her real name of Maria. In addition to this, the initial letters of the first, third, fifth, seventh, and ninth lines of the dedicatory poem form the name of Maria; so that here we have the acrostic in the second degree. No wonder that thus entrammelled the poet's thought begins to flag and his language to halt.

The third important work written by Boccaccio during his stay at Florence, or soon after his return to Naples, is called *L'amorosa Fiammetta*, and although written in prose, it contains more real poetry than the elaborate production just referred to. It purports to be Fiammetta's complaint after her lover, following the call of filial duty, had deserted her. Bitterly she deplures her fate, and upbraids her lover with coldness and want of devotion. Jealous fears add to her torture, not altogether unfounded, if we believe the commentators' assertion that the heroine of *Ameto* is in reality the beautiful Lucia, a Florentine lady loved by Boccaccio. Sadly Fiammetta recalls the moments of former bliss—the first meeting, the stolen embrace. Her narrative is indeed our chief source of information for the incidents of this strange love-story. It has been thought unlikely, and indeed impossible, that Boccaccio should thus have become the mouthpiece of a real lady's real passion for himself—but there seems nothing incongruous in the supposition that after a happy reunion the poet should have heard with satisfaction, and surrounded with the halo of ideal art, the story of his lady's sufferings. Moreover, the language is too full of individual intensity to make the conjecture of an entirely fictitious love affair intrinsically probable. *L'amorosa Fiammetta* is a monody of passion sustained even to the verge of dulness, but strikingly real and therefore artistically valuable.

By the intercession of an influential friend, Boccaccio at last obtained (in 1344) his father's permission to return to Naples, where in the meantime Giovanna, grand-daughter of King Robert had succeeded to the crown. Being young and beautiful fond of poetry and of the praise of poets, she received Boccaccio with all the distinction due to his literary fame. For many years she remained his faithful friend and the poet returned her favour with grateful devotion. Even when the charge of having instigated, or at least connived at the murder of her husband was but too clearly proved against her, Boccaccio was amongst the few who stood by her and undertook the hopeless task of clearing her name from the dreadful stain. It was by her desire—no less than by that of Fiammetta—that he composed (between 1344 and 1350) most of the stories of his *Decameron*, which afterwards were collected and placed in the mouths of the Florentine ladies and gentlemen. During this time he also composed the *Filostrato*, a narrative poem, the chief interest of which for the English reader, lies in its connection with Chaucer. With a boldness pardonable only in men of genius, the great English poet has adopted the main features of the plot, and has literally translated parts of Boccaccio's work, without so much as mentioning the name of his Italian source.<sup>1</sup>

In 1350 Boccaccio returned to Florence, owing to the death of his father, who had made him guardian to his younger brother Jacopo. He was received with great dis-

tingtion, and entered the service of the Republic, being at various times sent on important missions to the margrave of Brandenburg, and to the courts of several popes, both in Avignon and Rome. Boccaccio boasts of the friendly terms on which he had been with the great potentates of Europe, the emperor and pope amongst the number. But he was never a politician in the sense that Dante and Petrarch were. As a man of the world he enjoyed the society of the great, but his interest in the internal commotions of the Florentine state seems to have been very slight. Besides, he never liked Florence, and the expressions used by him regarding his fellow-citizens betray anything but patriotic prejudice. In a Latin eulogium he applies to them the term "*Batrachos*" (frog), by which, he adds parenthetically—*Ego intelligo Florentinorum morem; loquacissimi enim sumus, verum in rebus bellicis nihil valemus*. The only important result of Boccaccio's diplomatic career was his intimacy with Petrarch. The first acquaintance of these two great men dates from the year 1350, when Boccaccio, then just returned to Florence, did all in his power to make the great poet's short stay in that city agreeable. When in the following year the Florentines were anxious to draw men of great reputation to their newly-founded university, it was again Boccaccio who insisted on the claims of Petrarch to the most distinguished position. He himself accepted the mission of inviting his friend to Florence, and of announcing to Petrarch at the same time that the forfeited estates of his family had been restored to him. In this manner an intimate friendship grew up between them to be parted only by death. Common interests and common literary pursuits were the natural basis of their friendship, and both occupy prominent positions in the early history of that great intellectual revival commonly called *Renaissance*.

During the 14th century the study of ancient literature was at a low ebb in Italy. The interest of the lay world was engrossed by political struggles, and the treasures of classical history and poetry were at the mercy of monks, too lazy or too ignorant to use, or even to preserve them. Boccaccio himself told that, on asking to see the library of the celebrated monastery of Monte Casino, he was shown into a dusty room without a door to it. Many of the valuable manuscripts were mutilated, and his guide told him that the monks were in the habit of tearing leaves from the codices to turn them into psalters for children, or amulets for women at the price of four or five *solidi* a piece. Boccaccio did all in his power to remove by word and example this barbarous indifference. He bought or copied with his own hand numerous valuable manuscripts, and an old writer remarks that if Boccaccio had been a professional copyist, the amount of his work might astonish us. His zealous endeavours for the revival of the all but forgotten Greek language in western Europe are well known. The most celebrated Italian scholars about the beginning of the 15th century were unable to read the Greek characters. Boccaccio deplored the ignorance of his age. He took lessons from Leone Pilato, a learned adventurer of the period, who had lived a long time in Thessaly and, although born in Calabria, pretended to be a Greek. By Boccaccio's advice Leone Pilato was appointed professor of Greek language and literature in the university of Florence, a position which he held for several years, not without great and lasting benefit for the revival of classical learning. Boccaccio was justly proud of having been intimately connected with the foundation of the first chair of Greek in Italy. But he did not forget, in his admiration of classic literature, the great poets of his own country. He never tires in his praise of the sublime Dante, whose works he copied with his own hand. He conjures his friend Petrarch to study the great Florentine, and to defend himself against

<sup>1</sup> Among the publications of the Chaucer Society for 1873 the reader will find a careful analysis of *Filostrato*, together with an English translation of the lines partly or entirely embodied in Chaucer's poem, by Mr W. M. Rossetti. The parallel between the treatment of the same story by two poets, both great in their individual spheres, and both in a manner representative of their national types of literature, is of enormous interest.

the charges of wilful ignorance and envy brought against him. A life of Dante, and the commentaries on the first 16 cantos of the *Inferno*, bear witness to Boccaccio's learning and enthusiasm.

In the chronological enumeration of our author's writings we now come to his most important work, the *Decameron*, a collection of one hundred stories, published in their combined form in 1353, although mostly written at an earlier date. This work marks in a certain sense the rise of Italian prose. It is true that Dante's *Vita Nuova* was written before, but its involved sentences, founded essentially on Latin constructions, cannot be compared with the infinite suppleness and precision of Boccaccio's prose. The *Cento Novelle Antiche*, on the other hand, which also precedes the *Decameron* in date, can hardly be said to be written in artistic language according to definite rules of grammar and style. Boccaccio for the first time speaks a new idiom, flexible and tender, like the character of the nation, and capable of rendering all the shades of feeling, from the coarse laugh of cynicism to the sigh of hopeless love. It is by the name of "Father of Italian Prose" that Boccaccio ought to be chiefly remembered.

Like most progressive movements in art and literature, Boccaccio's remoulding of Italian prose may be described as a "return to nature." It is indeed the nature of the Italian people itself which has become articulate in the *Decameron*; here we find southern grace and elegance, together with that unveiled *naïveté* of impulse which is so striking and so amiable a quality of the Italian character. The undesirable complement of the last-mentioned feature, a coarseness and indecency of conception and expression hardly comprehensible to the northern mind, also appears in the *Decameron*, particularly where the life and conversation of the lower classes are the subject of the story. At the same time, these descriptions of low life are so admirable, and the character of popular parlance rendered with such humour, as often to make the frown of moral disgust give way to a smile.

It is not surprising that a style so concise and yet so pliable, so typical and yet so individual, as that of Boccaccio was of enormous influence on the further progress of a prose in a manner created by it. This influence has indeed prevailed down to the present time, to an extent beneficial upon the whole, although frequently fatal to the development of individual writers. Novelists like Giovanni Fiorentino or Franco Sacchetti are completely under the sway of their great model; and Boccaccio's influence may be discerned equally in the plastic fulness of Machiavelli and in the pointed satire of Aretino. Without touching upon the individual merits of Lasca, Bandello, and other novelists of the *cinquecento*, it may be asserted that none of them created a style independent of their great predecessor. One cannot indeed but acquiesce in the authoritative utterance of the Accademia della Crusca, which holds up the *Decameron* as the standard and model of Italian prose. Even the Della Cruscan writers themselves have been unable to deprive the language wholly of the fresh spontaneity of Boccaccio's manner, which in modern literature we again admire in Manzoni's *Promessi sposi*.

A detailed analysis of a work so well known as the *Decameron* would be unnecessary. The description of the plague of Florence preceding the stories is universally acknowledged to be a masterpiece of epic grandeur and vividness. It ranks with the paintings of similar calamities by Thucydides, Defoe, and Manzoni. Like Defoe, Boccaccio had to draw largely on hearsay and his own imagination, it being almost certain that in 1348 he was at Naples, and therefore no eye-witness of the scenes he describes. The stories themselves, a hundred in number, range from the highest pathos to the coarsest licentiousness.

A creation like the patient Griselda, which international literature owes to Boccaccio, ought to atone for much that is morally and artistically objectionable in the *Decameron*. It may be said on this head, that his age and his country were not only deeply immoral, but in addition exceedingly outspoken. Moreover, his sources were anything but pure. Most of his improper stories are either anecdotes from real life, or they are taken from the *fabliaux* of mediæval French poets. On comparing the latter class of stories (about one-fifth of the whole *Decameron*) with their French originals, one finds that Boccaccio has never added to, but has sometimes toned down the revolting ingredients. Notwithstanding this, it cannot be denied that the artistic value of the *Decameron* is greatly impaired by descriptions and expressions, the intentional licentiousness of which is but imperfectly veiled by an attempt at humour.

Boccaccio has been accused of plagiarism, particularly by French critics, who correctly state that the subjects of many stories in the *Decameron* are borrowed from their literature. A similar objection might be raised against Chaucer, Shakespeare, Goethe (in *Faust*), and indeed most of the master minds of all nations. Power of invention is not the only nor even the chief criterion of a great poet. He takes his subjects indiscriminately from his own fancy, or from the consciousness of his and other nations. Stories float about in the air, known to all yet realized by few; the poet gathers their *disjecta membra* into an organic whole, and thus he inspires and calls into life with the breath of his genius. It is in this sense that Boccaccio is the creator of those innumerable beautiful types and stories, which have since become household words amongst civilized nations. No author can equal him in these contributions to the store of international literature. There are indeed few great poets who have not in some way become indebted to the inexhaustible treasure of Boccaccio's creativeness. One of the greatest masterpieces of German literature, Lessing's *Nathan the Wise*, contains a story from Boccaccio (*Decameron*, Day 1st, tale iii.), and the list of English poets who have drawn from the same source comprises amongst many others the names of Chaucer, Lydgate, Dryden, Keats, and Tennyson.

For ten years Boccaccio continued to reside in Florence, leaving the city only occasionally on diplomatic missions or on visits to his friends. His fame in the meantime began to spread far and wide, and his *Decameron*, in particular, was devoured by the fashionable ladies and gentlemen of the age. About 1360 he seems to have retired from the turbulent scenes of Florence to his native Certaldo, the secluded charms of which he describes with rapture. In the following year took place that strange turning-point in Boccaccio's career, which is generally described as his conversion. It seems that a Carthusian monk came to him while at Certaldo charged with a posthumous message from another monk of the same order, to the effect that if Boccaccio did not at once abandon his godless ways in life and literature his death would ensue after a short time. It is also mentioned that the revelation to the friar on his deathbed of a secret known only to Boccaccio gave additional import to this alarming information. Boccaccio's impressionable nature was deeply moved. His life had been far from virtuous, in his writings he had frequently sinned against the rules of morality, and worse still, he had attacked with bitter satire the institutions and servants of holy mother church. Terrified by the approach of immediate death, he resolved to sell his library, abandon literature, and devote the remainder of his life to penance and religious exercise. To this effect he wrote to Petrarch. We possess the poet's answer; it is a masterpiece of writing, and what is more, a proof of tenderest friendship. The message of the monk Petrarch is evidently inclined

to treat simply as pious fraud, without however actually committing himself to that opinion. "No monk is required to tell thee of the shortness and precariousness of human life. Of the advice received accept what is good; abandon worldly cares, conquer thy passions, and reform thy soul and life of degraded habits. But do not give up the studies which are the true food of a healthy mind." Boccaccio seems to have acted on this valuable advice. His later works, although written in Latin and scientific in character, are by no means of a religious kind. It seems, however, that his entering the church in 1362 is connected with the events just related.

In 1363 Boccaccio went on a visit to Naples to the seneschal Acciajuoli (the same Florentine who had in 1344 persuaded the elder Boccaccio to permit his son's return to Naples), who commissioned him to write the story of his deeds of valour. On his arrival, however, the poet was treated with shameful neglect, and revenged himself by denying the possibility of relating any valorous deeds for want of their existence. This declaration, it must be confessed, came somewhat late, but it was provoked by a silly attack on the poet himself by one of the seneschal's indiscreet friends.

During the next ten years Boccaccio led an unsettled life, residing chiefly at Florence or Certaldo, but frequently leaving his home on visits to Petrarch and other friends, and on various diplomatic errands in the service of the Republic. He seems to have been poor, having spent large sums in the purchase of books, but his independent spirit rejected the numerous splendid offers of hospitality made to him by friends and admirers. During this period he wrote four important Latin works—*De Genealogia Deorum libri XV.*, a compendium of mythological knowledge full of deep learning; *De Montium, Silvarum, Lacuum, et Marium nominibus liber*, a treatise on ancient geography; and two historical books—*De Casibus Virorum et Feminarum Illustrum libri IX.*, interesting to the English reader as the original of John Lydgate's *Fall of Princes*; and *De Claris Mulieribus*. To the list of his works ought to be added *Il Ninfale Fiesolano*, a beautiful love-story in verse, and *Il Corbaccio ossia Il Laberinto d'Amore*, a coarse satire on a Florentine widow who had jilted the poet, written about 1355, not to mention many eclogues in Latin and miscellaneous *Rime* in Italian (the latter collected by his biographer Count Baldelli in 1802).

In 1373 we find Boccaccio again settled at Certaldo. Here he was attacked by a terrible disease which brought him to the verge of death, and from the consequences of which he never quite recovered. But sickness could not subdue his intellectual vigour. When the Florentines established a chair for the explanation of the *Divina Commedia* in their university, and offered it to Boccaccio, the senescent poet at once undertook the arduous duty. He delivered his first lecture on the 23d of October 1373. The commentary on part of the *Inferno*, already alluded to, bears witness of his unabated power of intellect. In 1374 the news of the loss of his dearest friend Petrarch reached Boccaccio, and from this blow he may be said to have never recovered. Almost his dying efforts were devoted to the memory of his friend; urgently he entreated Petrarch's son-in-law to arrange the publication of the deceased poet's Latin epic *Africa*, a work of which the author had been far more proud than of his immortal sonnets to Laura.

In his last will Boccaccio left his library to his father confessor, and after his decease to the convent of Santo Spirito in Florence. His small property he bequeathed to his brother Jacopo. His own natural children had died before him. He himself died on the 21st of December 1375 at Certaldo, and was buried in the church of SS.

Jacopo e Filippo of that town. On his tombstone was engraved the epitaph composed by himself shortly before his death. It is calm and dignified, worthy indeed of a great life with a great purpose. These are the lines:—

"Hæc sub mole jacent cineres ac ossa Joannis;  
Mens sedet ante Deum, meritis ornata laborum  
Mortalis vite. Genitor Boccaccius illi;  
Patria Certaldum; studium fuit alma poeseis."

A complete edition of Boccaccio's Italian writings, in 17 vols., has been published by Montier (Florence, 1834). The life of Boccaccio has been written by Tiraboschi, Mazzuchelli, Count Baldelli (*Vita di Boccaccio*, Florence, 1806), and others. The first printed edition of the *Decameron* is without date, place, or printer's name; but it is believed to belong to the year 1469 or 1470, and to have been printed at Florence. Besides this, Baldelli mentions eleven editions during the 15th century. The entire number of editions by far exceeds a hundred. A curious expurgated edition, authorized by the Pope, appeared at Florence, 1573. Here, however, the grossest indecencies remain, the chief alteration being the change of the improper personages from priests and monks into laymen. The best old edition is that of Florence, 1527. Of modern reprints, that by Forloni (Florence, 1857) deserves mention. Manni has written a *Storia del Decamerone* (1742), and a German scholar, M. Landau, has published (Vienna, 1869) a valuable investigation of the sources of the *Decameron*. An interesting English translation of the work appeared in 1624, under the title *The Model of Mirth, Wit, Eloquence, and Conversation*. (F. H.)

BOCCALINI, TRAJANO, an Italian satirist, was born at Loretto in 1556. The son of an architect, he himself adopted that profession, and it appears that he commenced late in life to apply to literary pursuits. Pursuing his studies at Rome, he had the honour of teaching Bentivoglio, and acquired the friendship of the cardinals Gaetano and Borghesi, as well as of other distinguished personages. By their influence he obtained various posts, and was even appointed by Gregory XIII. governor of Benevento in the states of the church. Here, however, he seems to have acted imprudently, and he was soon recalled to Rome, where he shortly afterwards composed his most important work, the *Ragguagli di Parnaso*, in which Apollo is represented as receiving the complaints of all who present themselves, and distributing justice according to the merits of each particular case. The book is full of light and fantastic satire on the actions and writings of his eminent contemporaries, and some of its happier hits are among the hackneyed felicities of literature. To escape, it is said, from the hostility of those whom his shafts had wounded, he returned to Venice, and there, according to the register in the parochial church of Sta Maria Formosa, died of colic, accompanied with fever, on the 16th of November 1613. It was asserted, indeed, by contemporary writers that he had been beaten to death with sand-bags by a band of Spanish bravadoes, but the story seems without foundation. At the same time, it is evident from the *Pietra del Paragone*, which appeared after his death in 1615, that whatever the feelings of the Spaniards towards him, he cherished against their feelings of the bitterest hostility. The only Government, indeed, which is exempt from his attacks is that of Venice, a city for which he seems to have had a special affection. The *Ragguagli*, which was first printed in 1612, has frequently been republished; but its popularity seems exceeded by that of the *Pietra*, which has been translated into French, German, English, and Latin. The English translator was Henry Earl of Monmouth, and the title of his version, *The Politicke Touchstone*, London, 1674. Another posthumous publication of Boccacini was his *Commentarii sopra Cornelio Tacito*, Geneva, 1669, which ought rather to be called observations than commentaries, and has not done much for his fame. Many of his manuscripts are preserved still unprinted in various Italian libraries. (See Mazzuchelli's *Scrittori d'Italia*.)

**BOCHART, SAMUEL**, a learned writer of the 17th century, specially distinguished as an Oriental scholar, was born at Rouen in Normandy, May 30, 1599. He was many years pastor of a Protestant church at Caen, and became tutor to Wentworth Dillon, earl of Roscommon, author of the *Essay on Translated Verse*. While at Caen he particularly distinguished himself by his public disputations with Father Veron, a Jesuit, and celebrated as a polemic. The dispute was held in the castle of Caen, in the presence of a great number of Catholics and Protestants, the duke of Longueville being among the former. In 1646 Bochart published his *Phaleg* and *Chanaan*, which are the titles of the two parts of his *Geographia Sacra*. His *Hierozoicon*, which treats of the sacred animals of Scripture, was printed at London in 1675. In 1652, Christina, queen of Sweden, invited him to Stockholm, whither he repaired, accompanied by Huet. On his return to Caen he resumed his duties as a minister of the gospel, married, and was received into the academy of that city. Bochart was a man of profound erudition; he possessed a thorough knowledge of the principal Oriental languages, including Hebrew, Syriac, Chaldaic, and Arabic; and such was his zeal for extending his acquirements, that at an advanced age he wished to learn Ethiopic. He was remarkable for modesty and candour; but so absorbed was he in his favourite study, that he saw Phœnician, and nothing but Phœnician, in everything, even in the words of the Celtic, and hence the prodigious number of chimerical etymologies which swarm in his works. He died at Caen, May 16, 1667. A complete edition of his works was published at Leyden, under the title of *Sam. Bochart Opera Omnia: hoc est; Phaleg, Chanaan, seu Geographia Sacra, et Hierozoicon, seu de Animalibus sacris Sacre Scripturæ, et Dissertationes Variæ*, 1675, 2 vols. folio; 1692, 1712, 3 vols. folio.

**BOCHNIA**, the chief town of a district in Austrian Galicia, on the River Raba or Uswica, a tributary of the Vistula. It is built principally of wood, and has a gymnasium, a hospital, and various public offices. Its importance is mainly due to its extensive salt mines, entrance to which is obtained by a shaft in the very heart of the town. The excavations, carried on at different levels, have completely undermined the whole area of the place, which was greatly damaged by a subsidence of the ground in 1843, occasioned by heavy floods. About 290,000 cwt. of salt are obtained annually. Population in 1869, 7480.

**BOCHUM**, the chief town of a circle in the Prussian province of Westphalia and government of Arnsberg, on the railway between Duisburg and Dortmund. It is a busy industrial town, with manufactures of cassimeres, woollen cloth, carpets, and hardware of various descriptions. About 27,000 hand coffee-mills are turned out annually. There is an extensive steel factory in the hands of a company; coal-mines are worked, and coke is manufactured; and a considerable trade is carried on in grain. Population in 1871, 21,192.

**BODE, JOHANN ELERT**, a celebrated German astronomer, born January 19, 1747, at Hamburg, where his father kept a commercial academy. From his earliest years he was devoted to the mathematical sciences, especially astronomy. In the garret of his father's house, with the aid of a telescope constructed by himself, he eagerly made observations of the heavens; and at eighteen years of age he had acquired so great a knowledge of astronomy, that when Dr Reimarus visited his father, young Bode was found occupied in calculating an eclipse of the sun. This incident was the means of introducing him to the notice of Professor Büsch, who at once afforded him every facility for prosecuting his labours with success. Shortly afterwards Bode

gave the first public proof of his knowledge by a short work on the solar eclipse of August 5, 1766; and this was followed by his *Anleitung zur Kenntniss des gestirnten Himmels*, an elementary treatise on astronomy, which was eminently successful, and has since gone through numerous editions. In 1772, being called to Berlin by Frederic II., he was made astronomer to the Academy of Sciences, and afterwards a member of that institution. The well-known periodical work entitled *Astronomische Jahrbücher*, which is continued to the present day, was commenced by Bode in 1774; but that on which his fame chiefly rests is the *Uranographia*, published in 1801, in which the industrious author has given observations of 17,240 stars, or 12,000 more than are to be found in any older charts. This veteran observer, who may justly be said to have been the first to diffuse a general taste for astronomy in Germany, died at Berlin, Nov. 23, 1826. For the curious empirical law which bears Bode's name, see *ASTRONOMY*, vol. ii. p. 806.

**BODIN, JEAN**, one of the ablest political thinkers in France during the 16th century, was born at Angers in 1530. He studied law at Toulouse, and, after taking his degree, lectured there for some time on jurisprudence. Thence he proceeded to Paris, and began to practise at the bar. His want of success is said to have been the reason of his applying himself to literature; but this we may reasonably doubt, as he was only twenty-five years of age when he published his first work, a translation of Oppian's *Cynegeticon* into Latin verse, with a commentary. Almost immediately on its publication the celebrated scholar, Turnebus, complained that some of his emendations had been appropriated without acknowledgment. A discourse on public instruction, *Oratio de Instituenda in Republica Juventute*, which Bodin had delivered at Toulouse, was printed in 1559, and his *Methodus ad Facilem Historiarum Cognitionem* appeared in 1566. The latter is a work of considerable interest and value. It has, indeed, no title to the high honour which M. Baudrillart assigns to it of having laid the foundation of the philosophy of history; but it contains several thoughts of essential importance to that philosophy, as, for example, those relative to the nature of history, to progress and law in history, and to historical causation. Two years later Bodin published a work in refutation of the views of M. de Malestroiet, who maintained that there had been no rise of prices in France during the three preceding centuries. The *Responsio ad Paradoxa Malestroietti* not only completely established the contrary, but for the first time explained in a nearly satisfactory manner the revolution of prices which took place in the 16th century, pointing out not only its primary but most of its secondary causes with remarkable perspicacity. This tract, the *Discours sur les causes de l'extrême cherté qui est aujourd'hui en France* (1574), and the disquisition on public revenues in the sixth book of the *Republic*, undoubtedly entitle Bodin to a distinguished position among the earlier cultivators of political economy. His learning, genial disposition, and conversational powers recommended him to the favour of Henry III. and of his brother, the duke of Alençon. The former appointed him to the office of king's attorney at Laon in 1576. This was the most eventful year of his life, being that in which he married, performed his most brilliant service to his country, and completed his greatest literary work. Elected by the Tiers État of Vermandois to represent it in the states-general of Blois, he contended with great skill and boldness in extremely difficult circumstances for freedom of conscience, justice, and peace. The nobility and clergy favoured the League, and urged the king to force his subjects to abjure Protestantism and profess the Catholic religion. When Bodin found he could not prevent this

resolution being carried, he contrived to get inserted in the petition drawn up by the states the clause "without war," which practically rendered all its other clauses nugatory. While he thus resisted the clergy and nobility and their dependents, he opposed the demand of the king to be allowed to alienate the public lands and royal demesnes, and had influence sufficient to get it refused, although the chief deputies had been won over to assent to it. This lost him the favour of the king, who wanted money on any terms. His *magnum opus*—*Les six livres de la République* (Paris, 1576)—passed through various editions in its author's lifetime, that of 1583 having as an appendix *L'apologie de René Herpin* (Bodin himself). In 1586 he issued a Latin version, for the use chiefly of English students of law and politics. It is the first elaborate attempt in modern times to construct a system of political science. "From the time," says Sir William Hamilton, "when Aristotle wrote his eight books of *Politics*, until the time when Montesquieu wrote his thirty-one books on *The Spirit of Laws*, the six books of the *Republic* of Bodinus is the ablest and most remarkable treatise extant on the philosophy of government and legislation; and even until the present day these three authors stand out as the great political triumvirate." Bodin was, of course, greatly indebted to Aristotle for his knowledge of the working of political causes, but he made use of what his illustrious predecessor taught him in no servile way, and added much from his own reflections, his large acquaintance with history, and his vivid personal experience. The *Republic* is a work of which it is quite impossible to give a brief account, and as there have been many lengthened summaries of it, it may suffice to say that those to be found in Hallam's *Lit. of Europe* (vol. ii. 1st ed.), Heron's *History of Jurisprudence*, Lermnier's *Introduction à l'Histoire du Droit*, and Bluntschli's *Geschichte des Staatsrechts*, give a good general view of its character, while that in Professor Baudrillart's *J. Bodin et son Temps* is so exceedingly careful and excellent that scarcely a thought of any value in the original has escaped being indicated. With all his breadth and liberality of mind Bodin was an exceedingly credulous believer in witchcraft, the virtues of numbers, and the power of the stars, and in 1580 he published the *Demonomanie des Sorciers*, a work which is a most humbling evidence that even the greatest men may not be exempt from the most irrational prejudices of their age. Although he was himself regarded by most of his contemporaries as a sceptic, and by some as an atheist, he denounced all who dared to doubt of sorcery, and zealously urged the burning of witches and wizards. It might, perhaps, have gone hard with himself if his counsel had been strictly followed, as he confessed to have had from his thirty-seventh year a friendly demon who, if properly invoked, touched his right ear when he purposed doing what was wrong, and his left when he meditated doing good. To the duke of Alençon Bodin owed several important preferments. In 1581 he accompanied his patron as secretary when that prince came over to England to seek the hand of Queen Elizabeth. Here he had the pleasure of finding that the *Republic* was studied at London and Cambridge, although in a barbarous Latin translation. This was what determined him to translate his work into Latin himself. The latter part of Bodin's life was spent at Laon, the inhabitants of which he is said to have persuaded to declare for the League in 1589, and for Henry IV. five years afterwards. He died of the plague in that city in 1596, and was buried in the church of the Carmelites. In the year during which he died there appeared his *Universale Naturæ Theatrum*, which was translated into French by Foacrolles in the following year. He left behind him a very famous MS., the *Colloquium Heptaplomeris de additis rerum sublimium arcanis*, which

was published for the first time in a complete form by Noack in 1857, although it had been previously studied by others, e.g., Grotius, Huet, Ménage, Diekmann, &c. It is composed in the form of a conversation between seven learned men—a Jew, a Mahometan, a Lutheran, a Zwinglian, a Roman Catholic, an Epicurean, and a Theist. The conclusion to which they are represented as coming is that they will live together in charity and toleration, and cease from further disputation as to religion.

*Authorities.*—The works of Bodin above mentioned; H. Baudrillart, *J. Bodin et son Temps* (Paris, 1853); N. Planchenaull, *Études sur Jean Bodin* (Angers, 1858); and Thierry, *History of the Tiers État* (Engl. Transl.) As to the political philosophy of Bodin, see the works of Hallam, Heron, Lermnier, and Bluntschli, already indicated; as to his political economy, Kautz, *Geschichte der National-Oekonomik*, ii. 269–271; as to his ethical teaching, A. Desjardins, *Les Moralistes Français du Seizième Siècle*, ch. v.; and as to his historical views, Flint's *Philosophy of History in Europe*, i. 69–76. (R. F.)

BODLEY, SIR THOMAS, founder of the Bodleian library at Oxford, was born at Exeter in 1544. When he was about twelve years of age, his father, John Bodley, being obliged to leave the kingdom on account of his Protestant principles, settled with his family at Geneva, and continued there till the death of Queen Mary. In that university, then in its infancy, young Bodley studied under several eminent professors. On the accession of Queen Elizabeth he returned with his father to England, and was soon after entered of Magdalen College, Oxford. In 1563 he took the degree of bachelor of arts, and the year following was admitted a fellow of Merton College. In 1565 he read a Greek lecture in the hall of that college, took the degree of master of arts the year after, and read natural philosophy in the public schools. In 1569 he was one of the proctors of the university, and for some time after officiated as public orator. Quitting Oxford in 1576, he made the tour of Europe; and on returning to his college after four years absence he applied himself to historical and political studies. He became gentleman-usher to Queen Elizabeth; and in 1585 he married Anne Bali, a widow lady of considerable fortune, whose father, named Carew, was of Bristol. He was soon after sent as ambassador to the king of Denmark, and to several German princes. He was next despatched on a secret mission to France; and in 1588 he went as ambassador to the United Provinces. On his return to England in 1597, finding his preferment obstructed by the jarring interests of Burleigh and Essex, he retired from court, and could never afterwards be prevailed on to accept of any public employment. He now began the foundation of the Bodleian library; and soon after the accession of King James I. he received the honour of knighthood. He died at his house in London, January 28, 1612, and was buried in the choir of Merton College chapel, where a monument of black and white marble was erected to him, on which stands his effigy in a scholar's gown, surrounded with books. Sir Thomas wrote his own life to the year 1609, which, with the first draught of the Statutes and his Letters, has been published from the originals in the Bodleian library, by Hearn, under the title of *Reliquiæ Bodleianæ, or Authentic Remains of Sir Thomas Bodley*, London, 1793, 8vo. For a particular account of the Bodleian library, see LIBRARIES.

BODMIN, a parliamentary and municipal borough and market-town of England, in the county of Cornwall, 235 miles from London, and 30 from Plymouth by rail. It is situated between two hills, and consists of one narrow but well-paved street, about a mile in length. The church of St Petrock, which formerly belonged to the monastery of that name, is a spacious building dating from 1472; and the town hall consists partly of remains of the convent of the Grey Friars. A lunatic asylum, erected in 1866, the

county jail, rebuilt in 1859, and a market-house of recent date, are among the chief buildings. The principal manufacture is shoes. Four annual fairs for cattle and horses are held in the town, and at St Lawrence, one mile to the S.W., there is a fair in October for cattle and sheep. Bodmin returned two members to Parliament from the time of Edward I. till 1868, when its representation was reduced to one member. The assizes and quarter-sessions are held in the town, and it is one of the polling-places for the east division of the county. Bodmin or, as the name appears in charters, *Bosmana* or *Bod-munan*, grew up in the neighbourhood of a monastic building, which is said to have been founded as early as 926. At the time of the Conquest it was a flourishing town, but fell into decay at the Reformation, and only recovered its prosperity in the course of last century. In 1498 the Cornish insurrection was originated by the people of Bodmin, who again, in the reign of Edward VI., expressed their discontent at the change of religion by resorting to arms. Population of municipal borough in 1871, 4672, and of parliamentary borough, 6758.

Arms of Bodmin.

BODONI, GIAMBATTISTA, superintendent of the royal press at Parma, chief printer to His Catholic Majesty, member of various academies in Italy, and knight of several orders, was born in 1740, at Saluzzo in Piedmont, where his father owned a printing establishment. While yet a boy he began to engrave on wood. He at length went to Rome, and there became a compositor for the press of the Propaganda. He made himself acquainted with the Oriental languages, and thus was enabled to render essential service to the Propaganda press, by restoring and accurately distributing the types of several Oriental alphabets which had fallen into disorder. The Infante Don Ferdinand having established at Parma, about 1760, a printing-house on the model of those in Paris, Madrid, and Turin, Bodoni was placed at the head of this establishment, which he soon rendered the first of the kind in Europe. The beauty of his typography, &c., leaves nothing further to be desired; but the intrinsic value of his editions is seldom equal to their outward splendour. His Homer, however, is a truly magnificent work; and, indeed, his Greek letters are faultless imitations of the best Greek manuscript. His editions of the Greek, Latin, Italian, and French classics are all highly prized for their typographical elegance, and some of them are not less remarkable for their accuracy. Bodoni died at Padua in 1813, aged 73. In 1818 a magnificent work appeared in two volumes quarto, entitled *Manuale Tipografico*, containing specimens of the vast collection of types which had belonged to this celebrated typographer. See De Lama, *Vita del Cavaliere Giambattista Bodoni*, 1816, 2 vols.

BOECE, or BOYCE, HECTOR, a distinguished Scottish historian, was born at Dundee, about the year 1465, being descended of a family which for several generations had possessed the barony of Panbride or Balbride. The orthography of his surname is extremely fluctuating; it is to be found under the various modifications of Boece, Boeth, Boeis, Boys, Boyse, Boyis, Boiss, and Boyce. He received his early education at Dundee, and completed his course of study in the university of Paris, where he took the degree of B.D. He was appointed a professor of philosophy in the college of Montaigne, and in this summary he became intimately acquainted with Erasmus.

who in two epistles has testified his esteem for Boece's character (*Erasmii Opera*, tom. i. tom. iii. col. 1784, edit. Clerici). In his academical station he had already distinguished himself when King's College was founded at Aberdeen by the munificence of William Elphinstone, bishop of the diocese. The Papal bull for the erection of a university had been obtained in the year 1494, but the buildings were not sufficiently advanced, nor did the lectures commence, till about the year 1500. It was not without some degree of hesitation that he consented to quit the lettered society of Paris, and to become principal of this new college; but having at length accepted the conditions, he proceeded to Aberdeen, and experienced a kind reception from the canons of the cathedral, several of whom he has commemorated as men of learning. It was a part of his duty as principal to read lectures on divinity. The common branches of science and literature were taught with zeal and success; and the prosperity of the institution was greatly promoted by the influence of Boece.

The emoluments of his office were not such as appear very dazzling to modern eyes. "Boethius, as president of the university," says Dr Johnson, "enjoyed a revenue of forty Scottish marks, about two pounds four shillings and sixpence of sterling money. In the present age of trade and taxes, it is difficult even for the imagination so to raise the value of money, or so to diminish the demands of life, as to suppose four and forty shillings a year an honourable stipend; yet it was probably equal not only to the needs but to the rank of Boethius. The wealth of England was undoubtedly to that of Scotland more than five to one, and it is known that Henry the Eighth, among whose faults avarice was never reckoned, granted to Roger Ascham, as a reward of his learning, a pension of ten pounds a year." But it is necessary to recollect that this was not the only preferment which Boece enjoyed: he was not only principal of King's College, but was likewise a canon of Aberdeen, and rector of Tyrie in the same county. Under the date of July 14, 1527, we find a "grant to Maister Hector" of an annual pension of £50, to be paid by the sheriff of Aberdeen out of the king's casualties, and on the 26th of July 1529 was issued a "precept for a letter to Mr Hector Boys, professor of theology, of a pension of £50 Scots yearly, until the king promote him to a benefice of 100 marks Scots of yearly value; the said pension to be paid him by the customers of Aberdeen." In 1533 and 1534, one-half of his pension was, however, paid by the king's treasurer, and the other half by the comptroller, and as no payment subsequent to that of Whitsuntide 1534 has been traced in the treasurer's accounts, he is supposed to have obtained his benefice soon after that period.

His earliest publication, the lives of the bishops of Aberdeen, appeared under the following title—*Episcoporum Murthlacensium et Aberdonensium per Hectorem Boetium Vita. Impressa sunt hac prelo Ascensiano ad Idus Maias anno Solutis, M.D.XXII.*, 4to. This little volume, which is of great rarity, was reprinted for the members of the Bannatyne Club—*Hectoris Boetii. Murthlacensium et Aberdonensium Episcoporum Vita iterum in lucem edita*, Edin., 1825, 4to. Of this diocese the seat was originally at Murthlack, or Mortlach, in the county of Banff, but it was afterwards transferred to Aberdeen. His notices of the early prelates are necessarily brief and unsatisfactory, and the most interesting portion of the book is that which relates to his liberal patron Bishop Elphinstone, of whose private history and public services he has given a circumstantial detail, which occupies nearly one-third of the volume. Here we likewise find an account of the foundation and constitution of the college, together with some notices of its earliest members. His more famous work, the *History of Scotland*, was published after an interval of

five years :—*Scotorum Historiæ a prima gentis origine cum aliarum et rerum et gentium illustratione non vulgari : præmissa epistola nuncupatoria, tabellisquæ amplissimis, et non penultima Isago, quæ ab hujus tergo explicabitur diffusius. Quæ omnia impressa quidem sunt Iodoci Badii Ascensii typis et opera ; impensis autem nobilibus et prædocti viri Hectoris Boethii Deidonani, a quo sunt et condita et edita*, fol. The title and colophon have no date, but the commendatory epistle by Alexander Lyon, precentor of the cathedral of Elgin, bears the 15th of March 1527. This edition contains seventeen books. Another edition, containing the eighteenth book and a fragment of the nineteenth, was published by Ferrerius, who has added an appendix of thirty-five pages ; Paris, 1574, fol. Though published at Paris, the latter edition appears from the colophon to have been printed at Lausanne.

The composition of Boece's history displays much ability ; and if the style does not always reach the standard of ancient purity, it displays a certain vein of elegance which generally renders it attractive. The author's love of his native country, and his anxiety to emblazon the heroic deeds of his countrymen, are conspicuous in every part of the work ; nor must we leave unnoticed those aspirations after political freedom, by which he was honourably distinguished at a period when the human mind was so generally chained to the earth by the most slavish maxims of submission. It may be recorded as commendation instead of reproach, that his principles of polity have been represented as no better than those of Buchanan. Boece's imagination was, however, stronger than his judgment : of the extent of the historian's credulity, his narrative exhibits many unequivocal proofs ; and if this circumstance admits of a sufficient excuse from the common propensity of the age in which he lived, his work presents strong indications of another fault, for which it is not so easy to find an apology. According to Bishop Lloyd, he put Fordun's tales "into the form of an history, and pieced them out with a very good invention, that part in which he chiefly excelled." (Lloyd's *Historical Account of Church Government in Great Britain and Ireland*, pref.) He professes to have obtained from the monastery of Iolinkill, through the good offices of the earl of Argyll, and his brother the treasurer, certain original historians of Scotland, and among the rest Veremundus and Campbell, of whose writings not a single vestige is now to be found. In his dedication to the king, he is pleased to state that Veremundus, a Spaniard by birth, was archdeacon of St Andrews, and that he wrote in Latin a history of Scotland from the origin of the nation to the reign of Malcolm III., to whom he inscribed his work. According to Bishop Stillingfleet, whose opinion has been adopted by many other writers, these historians never existed except in Boece's fertile imagination. His propensity to the marvellous was at an early period exposed in the following tetrastich of Leland :—

"Hectoris historici tot quot mendacia scripsit,  
Si vis ut numerem, lector amice, tibi,  
Me jubeas etiam fluctus numerare marinos,  
Et liquidi stellas connumerare poli."

Lhuyd, who attacked him in different works, spoke of his fabrications with unsparing severity, nor did he experience much better treatment from Staniburst, an Irish writer of considerable reputation. Of his merits as an historian a very unfavourable estimate was formed by Lord Hailes and Mr Finkerton. But in the opinion of Wallace, a learned lawyer, his "elegant style and correct composition, not to add beautiful genius and fine fancy, are conclusive proofs that his understanding could not be inaccurate." And, as Maitland, the editor of Bellenden's translation of Boece's history, has remarked, "in forming a final estimate of the literary character of Boece, we must bear

in mind that, when scholar-craft in this country at least was rare, he was a scholar, and contributed, by reviving ancient learning, to dispel the gloom of the Middle Ages ; and that, while the history of his country existed only in the rude page of the chroniclers who preceded him, or in the fading records of oral tradition, he embodied it in narrative so interesting and language so beautiful, as to be worthy of a more refined age."

Boece's *History of Scotland* was translated into the Scottish language by John Bellenden, archdeacon of Moray and canon of Ross. While the learned archdeacon was engaged in translating the work into prose, another individual was engaged in the more formidable task of translating it into verse. A copy of this metrical version, containing about 70,000 lines, is preserved in the library of the University of Cambridge ; a leaf seems to be wanting at the beginning, and the manuscript has suffered some other mutilations. The name of the versifier does not appear, nor has it been ascertained from any other document ; but we learn from the prologue that his labours, like those of Bellenden, were intended for the benefit of the young monarch. From the concluding lines, it is ascertained that he began his task in April 1531, and concluded it in September 1535. His verses are not distinguished by any considerable degree of energy or elegance, and the writer is chiefly to be commended for his perseverance.

In 1528, soon after the publication of his history, Boece took the degree of D.D. at Aberdeen ; and on this occasion the magistrates voted him a present of a tun of wine when the new wines should arrive, or, according to his option, the sum of £20 to purchase a new bonnet. He appears to have survived till the year 1536 ; for on the 22d of November in that year, the king presented John Garden to the rectory of Tyrie, vacant by the death of "Mr Hector Boiss." He died at Aberdeen, and, according to the most probable conjecture, he had then attained, or at least approached, the age of seventy.

BOECKH, August, one of the greatest scholars that Germany has produced in modern times, was born in Karlsruhe, November 24, 1785. He was sent to the gymnasium of his native city, and remained there until he left for the University of Halle. There he devoted himself to the study of theology, as his intention was to enter the church. He had the privilege of listening to the lectures of Schleiermacher and other eminent theologians ; but at this time in Halle F. Wolf was exercising a spell over the young men and creating an enthusiasm for classical studies. August Boeckh felt the spell, passed from theology to philology, and became the greatest of all Wolf's scholars. At Easter of 1806 he went to Berlin to study in the seminary for secondary teachers, conducted by Gedike ; but the disturbances which then agitated the country sent him home. In the summer of 1807 he came out as private-docent in the University of Heidelberg, and in the autumn of the same year he was appointed a professor extraordinary. Two years after (1809) he was nominated ordinary professor. In 1811 he removed to Berlin, having been appointed professor of eloquence and ancient literature in the university newly established there. Here he remained till his death, which took place August 3, 1867. He was elected a member of the Academy of Sciences of Berlin in 1814, and for a long time acted as its secretary. Many of the speeches contained in his *Kleine Schriften* were delivered in this latter capacity.

Boeckh worked out the ideas of Wolf in regard to philology, and illustrated them by his practice. Discarding the old notion that philology lay in a minute acquaintance with words and the exercise of the critical art, he believed it to be the entire knowledge of antiquity, historical and philosophical (*esse eam universæ antiquitatis cognitionem*

*historicam et philosopham*). He divides philology into five parts: first, an inquiry into public acts, with a knowledge of times and places, into civil institutions, and also into law; second, an inquiry into private affairs; third, an exhibition of the religions and arts of the ancient nations; fourth, a history of all their moral and physical speculations and beliefs, and of their literatures; and fifth, a complete explanation of the language. These ideas in regard to philology Boeckh gave out in a Latin oration delivered in 1822 (*Gesammelte Kleine Schriften*, vol. i. p. 104). He repeats them in somewhat different language in the speech which he delivered at the opening of the congress of German philologists in 1850. He there defines philology to be the historical construction of the entire life,—therefore, of all forms of culture and all the productions of a people in its practical and spiritual tendencies. He allows that such a work is too great for any one man; but the very infinity of subjects is the stimulus to the pursuit of truth, and men strive because they have not attained (vol. ii. p. 189). Even before Boeckh had published anything on this subject, his oral expositions had become widely spread, and were much discussed. (Lübker, "De Partitione Philologiae," *Gesammelte Schriften zur Philologie und Pädagogik*, vol. i. p. 8.) Freund gives the following account of Boeckh's division of philology:—

"Boeckh distinguishes two chief parts of philological discipline—a formal and a material part. To the formal part belong only interpretation and criticism; to the material all the other disciplines, even grammar. More particularly the material part embraces—I. the practical life; II. the theoretical life of the ancients. I. The practical, again, falls into the two divisions of—1. Public life, including (1) political history, (2) political antiquities, (3) chronology, and (4) geography; 2. Private life, which is considered as (1) external life, in agriculture, commerce, trades, domestic economy, and metrology; (2) internal life, including marriage, education, slaves, &c. II. Theoretical life is divided into two parts—1. The life in which the thought of man is presented externally through a symbol—worship, plastic art, music, *Orchestik*; 2. Life in which the thought remains pure within the mind—science. In the case of the last (1) the contents, and (2) the form of acquisition are distinguished. The contents lie originally in mythology, out of which philosophy developed itself, and out of philosophy came the other sciences, which are partly physical, including mathematics, and partly ethical. The form of knowledge is language, and it must be considered first in itself, in its inner structure through grammar, and then in its formation and application to the various artistic forms which the history of literature has to exhibit" (*Wie studirt man Philologie*, p. 29).

From 1806 till the time of his death, Boeckh's literary activity was unceasing. His principal works were—(1.) An edition of Pindar, the first volume of which (1811) contains the text of the Epinician odes; a treatise *De Metris Pindari*, in three books; and *Notæ Criticæ*: the second (1819) contains the *Scholia*; and part ii. of volume ii. (1821) contains a Latin translation, a commentary, the fragments, and indices. It is the most complete edition of Pindar that we have. But it was especially the treatise *De Metris Pindari* in the first volume which placed Boeckh in the first rank of scholars. This treatise forms an epoch in the treatment of Greek metres. In it the author threw aside all attempts to determine the Greek metres by mere subjective standards, pointing out at the same time the close connection between the music and the poetry of the Greeks. He investigated minutely the nature of Greek music as far as it can be ascertained, as well as all the details regarding Greek musical instruments; and he explained the statements of the ancient Greek writers on

rhythm. In this manner he laid the foundation for a new treatment of Greek metres. (2.) *Die Staatsaushaltung der Athener*, 2 vols., Berlin, 1817 (2d improved edition, Berlin, 1851), translated into English by Sir George Cornewall Lewis, 2 vols., Lond., 1828. Boeckh shows in this work an imperfect acquaintance with the principles of the modern science of political economy. The book might have been written by an ancient Greek. But this imperfection does not much impair its great value and extraordinary merits. Boeckh has in it investigated a subject of peculiar difficulty with profound learning. He has amassed information from the whole range of Greek literature, he has carefully appraised the value of the information given, and he shows throughout every portion of it rare critical ability and insight. Similar and supplementary to his work on the political economy of Athens, was his *Urkunden über das Seewesen des Attischen Staats*, Berlin, 1840. Allied to it also was his work *Metrologische Untersuchungen über Gewichte, Münzfusse, und Maasse des Alterthums*, Berlin, 1838. (3.) His third great work arose out of his second. In regard to the taxes and revenue of the Athenian state he derived a great deal of his most trustworthy information from inscriptions, and many of these inscriptions are given in his book. It was natural, therefore, that when the Berlin Academy of Sciences projected the plan of a *Corpus Inscriptionum Græcarum*, Boeckh should be chosen as the principal editor. This great work (1825–1859) is in four volumes, the last being incomplete. Boeckh's resources as a scholar have full scope in the treatment of these inscriptions, and though a new edition is now necessary and has been begun, Boeckh's explanations of them will form the basis of all subsequent commentaries.

These were Boeckh's great works; but his activity was continually digressing into widely different fields. He has gained for himself a foremost position amongst investigators into ancient chronology, and his name will occupy a parallel place with those of Ideler and Mommsen. His principal work on this subject was called *Zur Geschichte der Mondeyden der Hellenen*, Leipzig, 1855; but another, *Epigraphisch-chronologische Studien*, 1856, and several papers which he published in the *Transactions of the Berlin Academy*, throw light on the subject. Boeckh also occupied himself with philosophy. One of his earliest papers was on the Platonic doctrine of the world (*De Platonica corporis mundani fabrica*, 1809), and *De Plat. System. celestium globorum et de versa indole astronomie Philolæa*, 1810. In opposition to Gruppe he denied that Plato affirmed the diurnal rotation of the earth. *Untersuchungen über das kosmische System des Platon*, Berlin, 1852, and when in opposition to him Grote published his opinions on the subjects (Plato and the Rotation of the Earth) Boeckh was ready with his reply. Another of his earlier papers, and one frequently referred to, was *Commentatio Academica in similitudine quæ Platonem cum Xenophonte intercessisse fertur* (1811).

Boeckh did not do much in the way of editing the classics. We have already noticed his edition of Pindar. He also published an edition of the *Antigone* of Sophocles, with a poetical translation. (*Antigone, Griechisch und Deutsch: Nebst Abhandlungen über diese Tragödie in Ganzen und über Einzelne Stellen derselben*, Berlin, 1843). He also collected and arranged the fragments ascribed to Philolaus (Berlin, 1819), and endeavoured to show that they were genuine. The force of his arguments in this direction has, however, been recently weakened by Schaarschmidt, and the genuineness of the fragments is open to grave doubt.

The smaller writings of Boeckh began to be collected in his lifetime. Three of the volumes were published before his death, and four after (*Gesammelte kleine Schriften*, 7 vols., 1859–1873). The first two consist of orations

delivered in the university or academy of Berlin, or on public occasions. The third, fourth, fifth, and sixth contain his contributions to the *Transactions of the Berlin Academy*, and the seventh contains his critiques. The first two are valuable among other excellences from an educational point of view, and contain an exposition of many sound educational principles. In them Boeckh shows himself a man of wide heart, interested in the most diverse forms of investigation, an ardent patriot, and a lover of justice and truth (J. D.)

BOEHME, JAKOB (1575-1624), a mystical writer, whose surname (of which Fechner gives eight German varieties) appears in English literature as Beem, Behmont, &c., and notably in the form BEHMEN, was born at Alt-Seidenberg, in Upper Lusatia, a straggling hamlet among the hills, some ten miles S.E. of Görlitz. He came of a well-to-do family, but his first employment was that of herd boy on the Landskrone, a hill in the neighbourhood of Görlitz, and the only education he received was at the town-school of Seidenberg, a mile from his home. Seidenberg, to this day, is filled with shoemakers, and to a shoemaker Jakob was apprenticed in his fourteenth year (1589), being judged not robust enough for husbandry. Ten years later (1599) we find him settled at Görlitz as master-shoemaker, and married to Katharina, daughter of Hans Kuntzschmann, a thriving butcher in the town. After industriously pursuing his vocation for ten years, he bought (1610) the substantial house, which still preserves his name, close by the bridge, in the Neiss-Vorstadt. Two or three years later he gave up business, and did not resume it as a shoemaker; but for some years before his death he made and sold woollen gloves, regularly visiting Prague fair for this purpose.

Boehme's authorship began in his 37th year (1612) with a treatise, *Morgen Rothe im Aufgang*, which though unfinished was surreptitiously copied, and eagerly circulated in MS. by Karl von Euder. This raised him at once out of his homely sphere, and made him the centre of a local circle of liberal thinkers, considerably above him in station and culture. The charge of heresy was, however, soon directed against him by Gregorius Richter, then pastor primarius of Görlitz. Feeling ran so high after Richter's pulpit denunciations, that, in July 1613, the municipal council, fearing a disturbance of the peace, made a show of examining Boehme, took possession of his fragmentary quarto, and dismissed the writer with an admonition to needle no more with such matters. For five years he obeyed this injunction. But in 1618 began a second period of authorship; he poured forth, but did not publish, treatise after treatise, expository and polemical, in the next and the two following years. In 1622 he composed nothing but a few short pieces on true repentance, resignation, &c., which, however, devotionally speaking, are the most precious of all his writings. They were the only pieces offered to the public in his lifetime and with his permission, a fact which is evidence of the essentially religious and practical character of his mind. Their publication at Görlitz, on New Year's Day 1624, under the title of *Der Weg zu Christo*, was the signal for renewed clerical hostility. Boehme had by this time entered on the thud and most prolific though the shortest period (1623-4) of his speculation. His labours at the desk were interrupted in May 1624 by a summons to Dresden, where his famous "colloquy" with the Upper Consistorial Court was made the occasion of a flattering but transient ovation on the part of a new circle of admirers. Richter died in August 1624, and Boehme did not long survive his pertinacious foe. Seized with a fever when away from home, he was with difficulty conveyed to Görlitz. His wife was at Dresden on business; and during the first week of his malady he was nursed by

a literary friend. He died, after receiving the rites of the church, grudgingly administered by the authorities, on Sunday, 17th November. Clerical ill-will followed him to the grave, and the malice of the vulgar defaced his monument.

Boehme always professed that a direct inward opening or illumination was the only source of his speculative power. He pretended to no other revelation. Ecstatic raptures we should not expect, for he was essentially a Protestant mystic. No "thus saith the Lord" was claimed as his warrant, after the manner of Antoinette Bourignon, or Ludowick Muggleton; no spirits or angels held converse with him as with Swedenborg. It is needless to dwell, in the way either of acceptance or rejection, on the very few occasions in which his outward life seemed to him to come into contact with the invisible world. The apparition of the pail of gold to the herd boy on the Landskrone, the visit of the mysterious stranger to the young apprentice, the fascination of the luminous sheen, reflected from a common pewter dish, which first, in 1600, gave an intuitive turn to his meditations, the heavenly music which filled his ears as he lay dying—none of these matters are connected organically with the secret of his special power. The mysteries of which he discoursed were not reported to him: he "beheld" them. He saw the root of all mysteries, the *Ungrund* or *Urgrund*, whence issue all contrasts and discordant principles, hardness and softness, severity and mildness, sweet and bitter, love and sorrow, heaven and hell. These he "saw" in their origin; these he attempted to describe in their issue, and to reconcile in their eternal result. He saw into the being of God; whence the birth or going forth of the divine manifestation. Nature lay unveiled to him, he was at home in the heart of things. "His own book, which he himself was," the microcosm of man, with his threefold life, was patent to his vision. Such was his own account of his qualification. If he failed it was in expression; he confessed himself a poor mouthpiece, though he saw with a sure spiritual eye.

It must not be supposed that the form in which Boehme's pneumatic realism worked itself out in detail was shaped entirely from within. In his writings we trace the influence of Theophr. Bombast von Hohenheim, known as Paracelsus (1493-1541), of Kaspar Schwenkfeld (1490-1561), the first Protestant mystic, and of Valentin Weigel (1533-1588). From the school of Paracelsus came much of his puzzling phraseology,—his *Turba* and *Tinctur* and so forth,—a phraseology embarrassing to himself as well as to his readers. His friends plied him with foreign terms, which he was delighted to receive, interpreting them by an instinct, and using them often in a corrupted form and always in a sense of his own. Thus the word *Idea* called up before him the image of "a very fair, heavenly, and chaste virgin." The title *Aurora*, by which his earliest treatise is best known, was furnished by Dr Balthasar Walther. These, however, were false helps, which only serve to obscure a difficult study, like the *Flagrat* and *Lubet*, with which his English translator veiled Boehme's own honest *Schreck* and *Lust*. There is danger lest his crude science and his crude philosophical vocabulary conceal the fertility of Boehme's ideas and the transcendent greatness of his religious insight. Few will take the pains to follow him through the interminable account of his seven *Quellgeister*, which remind us of Gnosticism; or even of his three first properties of eternal nature, in which his disciples find Newton's formulæ anticipated, and which certainly bear a marvellous resemblance to the three *ἀρχαί* of Schelling's *Theogonische Natur*. Boehme is always greatest when he breaks away from his fancies and his trammels, and allows speech to the voice of his heart. Then he is artless, clear, and strong; and no man can help listening to him, whether he dive deep down with the

conviction "ohne Gift und Grimm kein Leben," or rise with the belief that "the being of all beings is a wrestling power," or soar with the persuasion that Love "in its height is as high as God." The mystical poet of Silesia, Joh. Angelus, discerned where Boehme's truest power lay when he sang—

"Im Wasser lebt der Fisch, die Pflanze in der Erden,  
Der Vogel in der Luft, die Sonne am Firmament,  
Der Salamander muss im Feuer erhalten werden,  
Und Gottes Herz ist Jakob Boehme's Element."

The three periods of Boehme's authorship constitute three distinct stages in the development of his philosophy. He himself marks a threefold division of his subject matter — 1. PHILOSOPHIA, i.e., the pursuit of the divine *Sophia*, a study of God in himself; this was attempted in the *Aurora*. 2. ASTROLOGIA, i.e., in the largest sense, cosmology, the manifestation of the divine in the structure of the world and of man, hereto belong, with others, *Die drei Principien göttlichen Wesens Vom dreifachen Leben der Menschen, Von der Menschwerdung Christi, Von der Geburt und Bezeichnung aller Wesen* (known as *Signatura Rerum*). 3. THEOLOGIA, i.e. in Scougall's phrase, "the life of God in the soul of man." Of the speculative writings under this head the most important are *Von der Gnadenwahl*, *Mysterium Magnum* (a spiritual commentary on Genesis), *Von Christi Testamenten* (the Sacraments).

Although Boehme's philosophy is essentially theological, and his theology essentially philosophical, one would hardly describe him as a philosophical theologian, and, indeed, his position is not one in which either the philosopher or the theologian finds it easy to make himself completely at home. The philosopher finds no trace in Boehme of a conception of God which rests its own validity on an accord with the highest canons of reason or of morals, it is in the actual not in the ideal that Boehme seeks God, whom he discovers as the spring of natural powers and forces, rather than as the goal of advancing thought. The theologian is staggered by a language which breaks the fixed association of theological phrases, and strangely reversing the usual point of view, characteristically pictures God as underneath rather than above. Nature rises out of Him, we sink into Him. The *Ungrund* of the unmanifested Godhead is boldly represented in the English translations of Boehme by the word *Abyss*, in a sense altogether unexplained by its Biblical use. In the *Theologia Germanica* this tendency to regard God as the *substantia*, the underlying ground of all things, is accepted as a foundation for piety; the same view, when offered in the colder logic of Spinoza, is sometimes set aside as atheistical. The procession of spiritual forces and natural phenomena out of the *Ungrund* is described by Boehme in terms of a threefold manifestation, commended no doubt by the constitution of the Christian Trinity, but exhibited in a form derived from the school of Paracelsus. From Weigel he learned a purely idealistic explanation of the universe, according to which it is not the resultant of material forces, but the expression of spiritual principles. These two explanations were fused in his mind till they issued forth as equivalent forms of one and the same thought. Further, Schwcnckfeld supplied him with the germs of a transcendental exegesis, whereby the Christian Scriptures and the dogmata of Lutheran orthodoxy were opened up in harmony with his new-found views. Thus equipped, Boehme's own genius did the rest. A primary effort of Boehme's philosophy is to show how material powers are substantially one with moral forces. This is the object with which he draws out the dogmatic scheme which dictates the arrangement of his seven *Quellgister*. Translating Boehme's thought out of the uncouth dialect of material symbols (as to which one doubts sometimes whether he means them as concrete

instances, or as pictorial illustrations, or as a mere *memoria technica*) we find that Boehme conceives of the correlation of two triads of forces. Each triad consists of a thesis, an antithesis, and a synthesis; and the two are connected by an important link. In the hidden life of the Godhead, which is at once *Nichts* and *Alles*, exists the original triad, viz., Attraction, Diffusion, and their resultant, the Agony of the unmanifested Godhead. The transition is made, by an act of will the divine Spirit comes to Light and immediately the manifested life appears in the triad of Love, Expression, and their resultant, Visible Variety. As the action of contraries and their resultant are explained the relations of soul, body, and spirit of good, evil, and free will; of the spheres of the angels, of Lucifer, and of this world. It is a more difficult problem to account on this philosophy for the introduction of evil. Boehme does not resort to dualism, nor has he the smallest sympathy with a pantheistic repudiation of the fact of sin. That the difficulty presses him is clear from the progressive changes in his attempted solution of the problem. In the *Aurora* nothing save good proceeds from the *Ungrund*, though there is good that abides and good that falls—Christ and Lucifer. In the second stage of his writing the antithesis is directly generated as such good and its contrary are coincidently given from the one creative source, as factors of life and movement, while in the third period evil is a direct outcome of the primary principle of divine manifestation—it is the wrath side of God. Corresponding to this change we trace a significant variation in the moral end contemplated by Boehme as the object of this world's life and history. To the first stage the world is created in remedy of a decline, in the second, for the adjustment of a balance of forces, in the third, to exhibit the eternal victory of good over evil, of love over wrath.

Boehme's influence has lain chiefly with the learned. Translations of sundry treatises have been made into Latin (by J. A. Werdnig, 1632), Dutch (complete, by W. v. Bayerland, 1634-41), and French (by Jean Macé, *etc.*, 1640, and L. C. de Saint Martin, 1800-9). For the nearest approach to popularity which his writings have enjoyed we must search the annals of the English Commonwealth. Between 1644 and 1662, all Boehme's works were translated by John Ellistone (d. 1652) and John Sparrow, assisted by Durand Hotham and Humphrey Blunden, who paid for the undertaking. At that time regular societies of *Behmenists* embracing not only the cultivated but the vulgar, existed in England and in Holland. They merged into the Quaker movement, holding already in common with Friends that salvation is nothing short of the very presence and life of Christ in the believer, and only kept apart by an objective doctrine of the sacraments which exposed them to the polemic of Quakers (e.g. J. Anderdon). Muggleton led an anthropomorphic reaction against them, and between the two currents they were swept away. The Philadelphian Society at the beginning of the 18th century consisted of cultured mystics, Jane Lead, Pordage, Francis Lee, Bromley, &c., who fed upon Boehme. William Law (1686-1761) somewhat later recurred to the same spring, with the result, however, in those dry times of bringing his own good sense into question rather than of reviving the credit of his author. After Law's death the old English translation was in great part re-edited (4 vols. 1762-84) as a tribute to his memory, by George Ward and Thomas Langaek, with plates from the designs of D. A. Freher (Brit. Mus. Add. MSS. 5767-94). This forms what is commonly called Law's translation, to complete it a 5th vol. (12mo, Dublin, 1820) is needed. Germany has also in this century turned to Boehme with eyes directly philosophical. "He is known," says Hegel, "as the *Philosophus Teutonicus*, and in reality through him for the first time did philosophy in Germany come forward with a characteristic stamp. The kernel of his philosophizing is purely German" (*Gesch. Ph.*, iii, 1836, p. 300). Franz Baader is the most remarkable of his recent philosophical exponents. See also Hamberger, *Die Lehre des deutschen Philosophen J. Boehmes*, 1841; Alb. Feip, *J. Boehme der deutsche Philosoph*, 1860; von Harless, *J. Boehme und die Alchymisten*, 1870. For Boehme's life, consult the *Memoirs*, by Abm. von Frankenberg and others, trans. by Fras. Okely, 1870; La Motte Fouqué's *J. Boehm, ein biographischer Denkstein*, 1831; and, above all, H. A. Fechner's *J. Böhm, sein Leben und seine Schriften*, 1857. A comprehensive study of Boehme in English is a desideratum. See *Memorial of W. Law* (by Chr. Walton, 1856); *Sat. Rev.*, xxxvi.

(1873) p. 52, *Unstar Rev. (Amer.)*, ii (1874) pp. 243, 447, art. by Prof. R. E. Thomson. Boehme's MSS. went to Holland. His works, having been separately printed at Amsterdam, 1631-82, by Hen. Beets and others, were first uniformly edited by J. G. Gichtel, Amst. 1682-3, in 24 pts. 8vo, bound in 6, 7, or 9 vols.; reprinted Amst. 1715, 2 vols. 4to; again, Amst. 1730-1, in 21 pts. 8vo, bound in 6 vols. They were re-edited by K. W. Schiebler, Leips. 1831-47, in 7 vols. 8vo; reprinted 1861, ff.

**BÆOTIA** (Βοιωτία) a country of Central Greece, bounded on the S. by the Gulf of Corinth, Megaris, and Attica; on the E. by Attica and the Euripus, which separates it from Eubœa; on the N. by the territory of the Locri Opuntii, and on the W. by Phocis. Its surface is estimated at 1119 English square miles. Surrounded nearly on all sides by mountains, it divides itself naturally into three parts, the low country about Lake Copais, or, as it is now called, the Lake of Topolias, the valley of the River Asopus (now Oropo), and the coast district between Mount Helicon and the Corinthian Gulf. The country about the lake is a large valley, so completely surrounded by hills that it is connected with the Eubœan Sea by subterranean passages only. The natural passages, or *katavothra*, not being sufficient to carry off the great masses of water accumulating in the valley, which is traversed by the Cephissus, the principal river in the country, the early inhabitants often suffered severely from inundations, and at a very remote period large artificial drains were constructed, probably by the Minyans of Orchomenos, to supplement the natural outlets. Remains of these works, as stupendous as any that were executed in antiquity, still excite the admiration of the traveller. They formerly rendered that part of Bœotia one of the most fertile districts of Greece, but being neglected for centuries, the shores of the lake became an extensive marsh. A large stretch of country is still often under water during the winter, but it begins to dry up in spring, and in summer forms fine wheat-fields and meadows. Between this valley of the Copais and the basin of the Asopus is situated the Theban plain, which is still distinguished for its fertility, especially in grain. The lowlands and valleys of Bœotia were notorious in antiquity for their moist and thick atmosphere, which was believed to render the inhabitants dull and stupid. For these characteristics the Bœotians are frequently satirized by the Attic writers; and it is certain that comparatively few names were added to the long roll of Greek literature from this portion of the Greek soil. One writer alone, perhaps, the poet Pindar, stands out in striking contrast to the national character; the two others who alone of his fellow-countrymen can claim to be also his intellectual kinsmen, Hesiod and Ptolemy, bear no small trace of a Bœotian origin. The dialect spoken by the Bœotians was a broad Æolic. In the earliest times of history Bœotia was inhabited by various tribes, such as the Aoniens, Temmicæns, Thracians, Leleges, Phlegyans, and the Minyans of Orchomenos. Of these we know almost nothing, but the last-mentioned appear to have formed a great centre of civilization at a very remote period. All these tribes were gradually expelled or absorbed by the Bœotian Æolians, who immigrated from Thessaly about sixty years after the destruction of Troy, according to the ordinary chronology. The country, which had previously possessed no common name, henceforth is always spoken of as Bœotia, and the several cities and towns, with Thebes at their head, formed a sort of confederation, in which, however, the Thebans and the other Bœotians frequently came into hostile collision, Thebes claiming the supremacy of the whole country, and the other cities insisting on their independence. The confederation was administered by a number of officers called Bœotarchs, of whom two were chosen by Thebes and one by each of the remaining confederate communities. The federal temple was that of Athene Itonica

at Coronea, and there a religious festival was held. The political history of the country is inseparable from that of ORCHOMENOS, THEBES, PLATÆÆ, and THESPIÆ, to which the reader must be referred for details. The confederacy continued its nominal existence even under the Roman emperors, although the country was so reduced that, about the time of Augustus, Tanagra and Thespiæ alone could be considered towns, the other cities having either been entirely destroyed, or existing only as villages. The more important of the towns which had formerly existed, besides those already mentioned, were Tegyra, Arue, Haliartus, Alalcomenæ, and Lebadea in the Copaic valley; Anthedon, Mycalessus, and Oropus along the Euripus; Thise and Creusis on the Corinthian Gulf; Ascræ and Leuctra further inland; and Sidæ, Tanagra, and Phæræ in the valley of the Asopus. During the Middle Ages and under the Turkish domination, Livadia, the ancient Lebadea, was the capital of the country, which indeed was frequently called after that city. The district is now united in one *Nomos* with Attica (Attikoviôtia), and is divided into two eparchies that take their names from Thebes and Livadia. The population in the eastern part is largely Albanian, and is engaged in the growing of grain and culture of the vine. See the *Travels of Clarke, Wheler, Dodwell, Sir W. Gell, Hobhouse, Holland, Leake, and Mure*; Thiersch, *Etat actuel de la Grèce*, 1833; Forchhammer, *Hellenika*, 1837; Kruse, *Hellas*, 1825-28; Klütz, *De fœdere Bœotico*, 1821; Ten Breujel, *De fœdere Bœotico*, 1834; Francke, *Der Bœotische Bund*, 1843; and Bursian's *Geographie von Griechenland*, 1863.

**BOERHAAVE**, HERMANN, one of the most celebrated physicians of modern times, was born at Voorhout near Leyden, December 31, 1668. Destined for the clerical profession, to which his father belonged, he received a liberal education, and early displayed unusual abilities. At the age of sixteen he entered the University of Leyden, where he studied under Gronovius, Ryckius, Trigland, and other distinguished men, and obtained the highest academical honours. In 1690 he took his degree in philosophy; on which occasion he delivered an inaugural dissertation *De distinctione mentis a corpore*, wherein he attacked the doctrines of Epicurus, Hobbes, and Spinoza. Being left, on the death of his father, without any provision, he was compelled to support himself by teaching mathematics. By the advice of Vandenberg, the burgomaster of Leyden, Boerhaave now applied himself with ardour to the study of medicine, to which indeed he had early manifested a decided inclination. The works of Hippocrates among the ancients, and those of Sydenham among the moderns, were the especial objects of his study; but his reading was by no means confined to these authors. In 1693 he took his degree of M.D. at Harderwyck in Guelderland, and immediately entered on the studies of his profession: His merits were soon recognized, and in 1701 he was appointed by the University of Leyden to supply the place of Drelnacourt as lecturer on the institutes of medicine. His inaugural discourse on this occasion was entitled *De commendando Hippocratis studio*, in which he recommended to his pupils that great physician as their model. In 1709, the university appointed him successor to Hotton in the chair of botany and medicine, in which capacity he did good service, not only to his own university, but also to botanical science, by his improvements and additions to the botanic garden of Leyden, and by the publication of numerous works descriptive of new species of plants. He was appointed in 1714 rector of the university. In the same year he succeeded Bidloo in the chair of practical medicine, and in this capacity he had the merit of introducing into modern practice the system of clinical instruction. Four years later he was appointed to the

chair of chemistry, and delivered an inaugural discourse, which contains the germs of his celebrated *Elements of Chemistry*. In 1728 he was elected into the Royal Academy of Sciences of Paris, and two years later into the Royal Society of London; to both of which he communicated his chemical researches. In 1729 declining health obliged him to resign the chairs of chemistry and botany; and in 1731 he resigned the rectorship of the university, to which office he had been re-elected. On this occasion he delivered a discourse *De Honore Medici Servitute*. This great and good man died, after a lingering and painful illness, on the morning of the 23d September 1738.

From the time of Hippocrates, no physician had more justly merited the esteem of his contemporaries and the admiration of posterity than Boerhaave. To uncommon intellectual abilities he united those amiable qualities of the heart which give them so great a value to society. His personal appearance was simple and venerable. He taught very methodically, and with great precision; his style was eloquent, and his delivery dignified and graceful. He sometimes also gave his lectures a livelier turn; but his raillery was never coarse or satirical. He possessed remarkable powers of memory, and was an accomplished linguist. A declared foe to all excess, he considered decent mirth as the salt of life. He was fond of music, with which he had a scientific acquaintance; and during winter he had a weekly concert in his house. It was his daily practice throughout life, as soon as he rose in the morning, which was generally very early, to retire for an hour to private prayer and meditation on some part of the Scriptures. He often told his friends, when they asked him how it was possible for him to go through so much fatigue, that it was this practice which gave him spirit and vigour in the business of the day.

Of his sagacity, and the wonderful penetration with which he often discovered and described, at first sight, such distempers as betray themselves by no symptoms to common eyes, very surprising accounts have been transmitted to us. Yet so far was he from having presumptuous confidence in his own abilities, or from being puffed up by prosperity, that he was condescending to all, and remarkably diligent in his profession. His great skill and celebrity as a physician brought him a large fortune. He left his only surviving daughter two millions of florins.

The genius of Boerhaave raised the fame of the University of Leyden, especially as a school of medicine, so as to make it a resort of strangers from every part of Europe. All the princes of Europe sent him disciples, who found in this skillful professor not only an indefatigable teacher, but an affectionate guardian. When Peter the Great went to Holland in 1715, to instruct himself in maritime affairs, he also took lessons from Boerhaave. The reputation of this eminent man was not confined to Europe; a Chinese mandarin wrote him a letter directed "To the illustrious Boerhaave, physician in Europe," and it reached him in due course. The city of Leyden raised a splendid monument to his memory in the church of St. Peter, inscribed "To the health-giving genius of Boerhaave," *SALUTIFERO BOERHAAVII GENIO SACRUM*.

The principal works of Boerhaave are—(1.) *Institutiones Medice*, Leyden, 1708; (2.) *Aphorismi de cognoscendis et curandis Morbis*, Leyden, 1709,—on this work, which was the text-book of Boerhaave's lectures, Van Swieten published a commentary in 5 vols. 4to; (3.) *Libellus de Materia Medica et Remediorum Formulæ*, Leyden, 1719; (4.) *Institutiones et Experimenta Chemicæ*, Paris, 1724.

BOETIUS, ANICIUS MANLIUS SEVERINUS, is described by Gibbon "as the last of the Romans whom Cato or Tully could have acknowledged for their countryman." The events of his life are involved in uncertainty. The

historians of the day give us but imperfect records or make unsatisfactory allusions. Later chroniclers indulged in the fictitious and the marvellous, and it is almost exclusively from his own books that trustworthy information can be obtained.

There is considerable diversity among authorities as to the name of Boetius. One editor of his *De Consolatione*, Bertius, thinks that he bore the prænomèn of Flavius, but there is no authority for this supposition. His father bore the name of Flavius, and it is probable that the Flavius Boetius who was prætorian præfect, and who was put to death in 455 A.D., by order of Valentinian III., was the grandfather of the subject of our notice; but these circumstances form no good reason for supposing that he also had the prænomèn of Flavius. Many of the earlier editions inserted the name of Torquatus, but it is not found in any of the best manuscripts. The last name is generally written Boethius, from the idea that it is connected with the Greek *Βοηθός*; but here, again, the best manuscripts agree in reading Boetius, and the latest editors have adopted this form.

The date of his birth is unknown; but it is conjectured on good grounds that he was born at Rome somewhere about the year 475 A.D. He was, therefore, too young to see the last of the Roman emperors (476), and his boyhood was spent in Rome while Odoacer, king of the Heruli, was monarch of that city. We know nothing of his early years. A passage in a treatise falsely ascribed to him (*De Disciplina Scholarium*) and a misinterpretation of a passage in Cassiodorus, led early scholars to suppose that he spent a long time in Athens pursuing his studies there; but later biographers have seen that there is no foundation for this opinion. His father, Flavius Manlius Boetius was consul in the year 487. It is probable that he died soon after; for Boetius states that, when he was bereaved of his parent, men of the highest rank took him under their charge (*De Con.*, lib. ii. c. 3). He soon became well known for his energy and ability, and his high rank gave him access to the noblest families. He married Rusticana, the daughter of the senator Symmachus. By her he had two sons, Anicius Manlius Severinus Boetius and Q. Aurelius Memmius Symmachus. When Theodoric, the king of the Ostrogoths, displaced Odoacer no change of fortune for the worse seems to have befallen Boetius. On the contrary he became a favourite with that monarch, and was one of his intimate friends. Boetius attained to the consulship in 510, and his sons, while still young, held the same honour together (522). Boetius regarded it as the height of his good fortune when he witnessed his two sons, consuls at the same time, convoyed from their home to the senate-house by a crowd of senators amidst the enthusiasm of the masses. On that day, he tells us, while his sons occupied the curule chairs in the senate-house, he himself had the honour of pronouncing a panegyric on the monarch, and placed between his two sons he distributed largesses among the people in the circus. But his good fortune did not last, and he attributes the calamities that came upon him to the ill-will which his bold maintenance of justice had caused, and to his opposition to every oppressive measure. "How often," he says, "have I opposed the attacks of Conigastus on the property of the weak? how often have I kept Triguilla, the chamberlain of the palace, from perpetrating acts of injustice? how often have I protected, by influence exercised at my own peril, the miserable whom the licensed avarice of the barbarians always harassed with endless insults?" And then he mentions several particular cases. A famine had begun to rage. The prefect of the prætorium was determined to satisfy the soldiers, regardless altogether of the feelings of the provincials. He accordingly issued an edict for a *cemptio*, that is, an order compelling the provincials

to sell their corn to the Government, whether they would or not. This edict would have utterly ruined Campania. Boetius interfered. The case was brought before the king, and Boetius succeeded in averting the *coemptio* from the Campanians. He also rescued Paulinus, a man of consular rank, from the jaws of those whom he calls *palatinae canes* (dogs of the palace), and who, he says, had almost devoured his riches. And he gives as a third and crowning instance in that he exposed himself to the hatred of the informer Cyprianus by preventing the punishment of Albinus, a man of consular rank. He mentions in another place that when at Verona the king was anxious to transfer the accusation of treason brought against Albinus to the whole senate, he defended the senate at great risk. In consequence of the ill-will that Boetius had thus roused, he was accused of treason towards the end of the reign of Theodoric. Three accusers appeared against him. The first, Basilus, had been expelled from the monarch's service, and in consequence of debt he had become an informer and now appeared against Boetius. The other two were Opilio and Gudestius, on whom sentence of banishment had been pronounced on account of innumerable frauds. They first took refuge in a church, but when this fact became known, a decree was issued that if they did not leave Ravenna before a prescribed day, they were to be driven out with a brand upon their forehead. On the very last day allowed them they gave information against Boetius, and their information was received. The accusation which these villains brought against him was that he had conspired against the king, that he was anxious to maintain the integrity of the senate, and to restore Rome to liberty, and that for this purpose he had written to the Emperor Justin. Justin had, no doubt, special reasons for wishing to see an end to the reign of Theodoric. Justin was orthodox. Theodoric was an Arian. The orthodox subjects of Theodoric were suspicious of their ruler; and many would gladly have joined in a plot to displace him. The knowledge of this fact may have rendered Theodoric suspicious. But Boetius denied the accusation in unequivocal terms. He did indeed wish the integrity of the senate. He would fain have desired liberty, but all hope of it was gone. The letters addressed by him to Justin were forgeries, and he had not been guilty of any conspiracy. Notwithstanding his innocence he was condemned and sent to Ticinum (Pavia) where he was thrown into prison. It was during his confinement in this prison that he wrote his famous work *De Consolatione Philosophiæ*. His goods were confiscated, and after an imprisonment of considerable duration he was put to death in 525. Procopius relates that Theodoric soon repented of his cruel deed, and that his death, which took place soon after, was hastened by remorse for the crime he had committed against his great counsellor.

Two or three centuries after the death of Boetius writers began to view his death as a martyrdom. Several Christian books were in circulation which were ascribed to him, and there was one especially on the Trinity which they regarded as proof that he had taken an active part against the heresy of Theodoric. It was therefore for his orthodoxy that Boetius was put to death. And these writers delight to paint with minuteness the horrible tortures to which he was exposed and the marvellous actions which the saint performed at his death. He was canonized as Saint Severinus. The brick tower in Pavia in which he was confined was a hallowed building. And finally, in the year 996, Otto III. ordered the bones of Boetius to be taken out of the place in which they had lain hid, and to be placed in the church of St Augustine within a splendid marble tomb, for which Gerbert, who afterwards became Pope under the name of Sylvester II, wrote an inscription

It should be mentioned also that some have given him a decidedly Christian wife, of the name of Elpis, who wrote hymns, two of which are still extant (Daniel, *Theol. Hymn.*, i. p. 156). This is a pure supposition inconsistent with chronology, unauthenticated by authority, and based only on a misinterpretation of a passage in the *De Consolatione*.

The contemporaries of Boetius regarded him as a man of profound learning. Priscian the grammarian speaks of him as having attained the summit of honesty and of all sciences. Cassiodorus, the chancellor of Theodoric and the intimate acquaintance of the philosopher, employs language equally strong. And Ennodius, the bishop of Pavia, knows no bounds for his admiration. "You surpass," he says to Boetius, "the eloquence of the ancients in imitating it." The king Theodoric had a profound idea of his great scientific abilities. He employed him in setting right the coinage. When he visited Rome with Gunibald king of the Burgundians, he took him to Boetius, who showed them, amongst other mechanical contrivances, a sun-dial and a water-clock. The foreign monarch was astonished, and, at the request of Theodoric, Boetius had to prepare others of a similar nature, which were sent as presents to Gunibald. It was Boetius also whom Theodoric consulted when Clovis, king of the Franks, wished a musician who could sing to the accompaniment of the lyre, and Boetius was charged with the duty of selecting him.

The fame of Boetius increased after his death, and his influence during the Middle Ages was exceedingly powerful. His circumstances peculiarly favoured this influence. He appeared at a time when contempt for intellectual pursuits had begun to pervade society. In his early years he was seized with a passionate enthusiasm for Greek literature, and this continued through life. Even amidst the cares of the consulship he found time for commenting on the *Categories* of Aristotle. The idea laid hold of him of reviving the spirit of his countrymen by imbuing them with the thoughts of the great Greek writers. He formed the resolution to translate all the works of Aristotle and all the dialogues of Plato, and to reconcile the philosophy of Plato with that of the Stagirite. He did not succeed in all that he designed; but he did a great part of his work. "Through your translations," says Cassiodorus to him, "the music of Pythagoras and the astronomy of Ptolemæus are read by the Italians; the arithmetic of Nicomachus and the geometry of Euclid are heard by the Westerns; the theology of Plato and the logic of Aristotle dispute in the language of Quirinus; the mechanical Archimedes also you have restored in a Latin dress to the Sicilians; and whatever discipline or arts fertile Greece has produced through the efforts of individual men, Rome has received in her own language through your single instrumentality." Boetius translated into Latin Aristotle's *Analytica Priora et Posteriora*, the *Topica*, and *Elenchi Sophistici*; and he wrote commentaries on Aristotle's *Categories*; on his book *περί ἱπποκρίτας*, also a commentary on the *Isagoge* of Porphyrius. These works formed to a large extent the source from which the Middle Ages derived their knowledge of Aristotle. (See Stahl, *Aristoteles bei den Römern*, pp. 196-234.)

But Boetius did not confine himself to Aristotle. He wrote a commentary on the *Topica* of Cicero; and he was also the author of independent works on logic:—*Introductio ad Categoricos Syllogismos*, in one book; *De Syllogismo Categorico*, in two books; *De Syllogismis Hypotheticis*, in two books; *De Divisione*, in one book; *De Definitione*, in one book; *De Differentiis Topicis*, in four books.

We have also seen from the statement of Cassiodorus that he furnished manuals for the quadrivium of the schools of the Middle Ages (the "*quattuor matheseos disciplina*,"

as Boetius calls them) on arithmetic, music, geometry, and astronomy. The statement of Cassiodorus that he translated Nicomachus is rhetorical. Boetius himself tells us in his preface addressed to his father-in-law Symmachus that he had taken liberties with the text of Nicomachus, that he had abridged the work when necessary, and that he had introduced formulæ and diagrams of his own where he thought them useful for bringing out the meaning. His work on music also is not a translation from Pythagoras, who left no writing behind him. But Boetius belonged to the school of musical writers who based their science on the method of Pythagoras. They thought that it was not sufficient to trust to the ear alone, to determine the principles of music, as did practical musicians like Aristoxenus, but that along with the ear, physical experiments should be employed. The work of Boetius is in five books, and is a very complete exposition of the subject. It remained a text-book of music in the Universities of Oxford and Cambridge till within comparatively recent times. It is still very valuable as a help in ascertaining the principles of ancient music, and gives us the opinions of some of the best ancient writers on the art. The manuscripts of the geometry of Boetius differ widely from each other. The latest editor, Godofredus Friedlein, thinks that there are only two manuscripts which can at all lay claim to contain the work of Boetius. He has published the *Ars Geometrice*, in two books, as given in these manuscripts; but critics are generally inclined to doubt the genuineness even of these.

By far the most important and most famous of the works of Boetius is his book *De Consolatione Philosophiæ*. Gibbon justly describes it as "a golden volume, not unworthy of the leisure of Plato or Tully, but which claims incomparable merit from the barbarism of the times and the situation of the author." It was a favourite book of the Middle Ages, and deserves to be a favourite still. The high reputation it had in mediæval times is attested by the numerous translations, commentaries, and imitations of it which then appeared. Among others Asser, the instructor of Alfred the Great, and Robert Grosseteste, bishop of Lincoln, commented on it. Alfred translated it into Anglo-Saxon. Versions of it appeared in German, French, Italian, Spanish, and Greek before the end of the 15th century. Chaucer translated it into English prose before the year 1382; and this translation was published by Caxton at Westminster, 1480. Lydgate followed in the wake of Chaucer. It is said that, after the invention of printing, amongst others Queen Elizabeth translated it, and that the work was well known to Shakespeare.

This famous work consists of five books. Its form is peculiar, and is an imitation of a similar work by Marcellus Capella, *De Nuptiis Philologia et Mercurii*. It is alternately in prose and verse. The verse shows great facility of metrical composition, but a considerable portion of it is transferred from the tragedies of Seneca. The first book opens with a few verses, in which Boetius describes how his sorrows had turned his hair grey, and had brought him to a premature old age. As he is thus lamenting, a woman appears to him of dignified mien, whom for a time he cannot distinguish in consequence of his tears, but at last he recognizes her as his guardian, Philosophy. She, resolving to apply the remedy for his grief, puts some questions to him for that purpose. She finds that he believes that God rules the world, but does not know what he himself is; and this absence of self-knowledge is the cause of his weakness. In the second book Philosophy presents to Boetius Fortune, who is made to state to him the blessings he has enjoyed, and after that proceeds to discuss with him the kind of blessings that fortune can bestow, which are shown to be unsatisfactory and uncertain. In the third book Philosophy promises to lead him to true happiness, which is to be found in God alone, for since God is the highest good, and the highest good is true happiness, God is true happiness. Nor can real evil exist, for since God is all-powerful, and since he does not wish evil, evil must be non-existent. In the fourth book Boetius raises the question, Why, if the governor of the universe is good, do evils exist, and why is virtue often punished and vice rewarded? Philo-

sophy proceeds to show that this takes place only in appearance; that vice is never unpunished nor virtue unrewarded. From this Philosophy passes into a discussion in regard to the nature of providence and fate, and shows that every fortune is good. The fifth and last book takes up the question of man's free will and God's foreknowledge, and, by an exposition of the nature of God, attempts to show that these doctrines are not subversive of each other; and the conclusion is drawn that God remains a foreknowing spectator of all events, and the ever-present eternity of his vision agrees with the future quality of our actions, dispensing rewards to the good and punishments to the wicked.

Several theological works have been ascribed to Boetius, as has been already mentioned. The *Consolatio* affords conclusive proof that the author was not a practical believer in Christianity. The book contains several expressions, such as *daemones*, *angelica virtus*, and *purgatoria clementia*, which have been thought to be derived from the Christian faith; but they are used in a heathen sense, and are explained sufficiently by the circumstance that Boetius was on intimate terms with Christians, and could not help being influenced to some extent by their language. The writer nowhere finds consolation in any Christian belief, and Christ is never named in the work. It is not impossible, however, that Boetius may have been brought up a Christian, and that in his early years he may have written some Christian books. This is the conjecture to which the latest editor of his Christian treatises has had recourse. Peiper thinks that the first three treatises are the productions of the early years of Boetius. The first, *De Sancta Trinitate*, is addressed to Symmachus (Domino Patri Symmacho), and the result of the short discussion, which is of an abstract nature, and deals partly with the ten categories, is that onity is predicated absolutely, or, in regard to the substance of the Deity, trinity is predicated relatively. The second treatise is addressed to John the deacon ("Ad Joannem Diaconum"), and its subject is "Utrum Pater et Filius et Spiritus Sanctus de divinitate substantialiter prædicentur." The treatise is shorter than the former, occupying only two or three pages, and the conclusion of the argument is the same. The third treatise bears the title, *Quomodo substantiæ in eo quod sint bonæ sint cum non sint substantialia bona*. It contains nothing distinctly Christian, and it contains nothing of great value; therefore its authorship is a matter of little consequence. Peiper thinks that, as the best MSS. uniformly assign these treatises to Boetius, they are to be regarded as his, that it is probable that Symmachus and John (who afterwards became Pope) were the men of highest distinction who took charge of him when he lost his father, and that these treatises are the first-fruits of his studies, which he dedicates to his guardians and benefactors. He thinks that the variations in the inscriptions of the fifth treatise, which is not found in the best manuscript, are so great that the name of Boetius could not have originally been in the title. The fourth book is also not found in the best manuscript, and two manuscripts have no inscription. He infers, from these facts, that there is no sure evidence for the authorship of the fourth and fifth treatises. The fifth treatise is *Contra Eutychen et Nestorium*. Both Eutyches and Nestorius are spoken of as living. A council is mentioned, in which a letter was read, expounding the opinion of the Eutychians for the first time. The novelty of the opinion is also alluded to. All these circumstances point to the Council of Chalcedon (451). The treatise was therefore written before the birth of Boetius, if it be not a forgery, but there is no reason to suppose that the treatise was not a genuine production of the time to which it professes to belong. The fourth treatise, *De Fide Catholica*, does not contain any distinct chronological data, but the tone and opinions of the treatise produce the impression that it probably belonged to the same period as the treatise against Eutyches and Nestorius. Several inscriptions ascribe both these treatises to Boetius. It will be seen from this statement that Peiper bases his conclusions on grounds far too narrow; and on the whole it is far more probable that Boetius wrote none of the four Christian treatises, particularly as they are not ascribed to him by any of his contemporaries. Three of them express in the strongest language the orthodox faith of the church in opposition to the Arian heresy, and these three put in unmistakable language the procession of the Holy Spirit from both Father and Son. The fourth argues for the orthodox belief of the two natures and one person of Christ. When the desire arose that it should be believed that Boetius perished from his opposition to the heresy of Theodoric, it was natural to ascribe to him works which were in harmony with this supposed fact. The works may really have been written by one Boethius, a bishop of Africa, as Jordanus supposes, or by some Saint Severinus, as Nitzsch conjectures, and the similarity of name may have aided the transference of them to the heathen or neutral Boetius.

The best editions of the entire works of Boetius are the Basel edition of 1570, and Migne's in his *Patrologia Cursus Completus, Series Latina*, vols. lxxii, lxxiv. There are many editions of the *De Consolatione*. The most recent are—(1) In Valpy's *Delphin Classics*, Nos. 54 and 55. This contains the lives of Boetius by Bertius and

by Rota, and a list of the various editions of Boetius. It has also numerous notes. (2.) An edition by Theodorus Obbarius, Jenæ, 1843. This contains prolegomena on the life and writings of Boetius, on his religion and philosophy, and on the manuscripts and editions, a critical apparatus, and notes. (3.) An edition by Rudolphus Peiper, Lipsiæ, 1871. This edition has the fullest collation of manuscripts, though a considerable number of manuscripts still remain to be collated. In addition to an account of the MSS. used, it gives the Book of Lupus "De Metris Boetii," the "Vita Boetii" contained in some MSS., "Elogia Boetii," and a short list of the commentators, translators, and imitators of the *Consolation*. It contains also an account of the metres used by Boetius in the *Consolation*, and a list of the passages which he has borrowed from the tragedies of Seneca. The work also includes the five treatises, four of them Christian, of which mention has been made above. In 1867 appeared a very satisfactory edition of Boetius's works, *De Institutione Arithmetica Libri Duo, De Institutione Musica Libri Quinque, Accedit Geometria quæ fertur Boetii: e libris manu scriptis edidit Godofredus Friedlein, Lipsiæ.* (J. D.)

**BOGHAZ-KEUY**, or **BOGHAS-KÖZ** (i.e., the Village of the Gorge), a small hamlet in Asia Minor, remarkable for its ruins, which are identified with the ancient Pterium or Pteria. It stands 3515 feet above the sea-level, about half-way between Angora and Amassia, almost in the 40th parallel of N. lat., on the banks of a small tributary of the Kizil Irmak. The present village contains about 150 houses, but the remains give evidence of its former importance. Almost all the heights they occupy bear traces of fortification; extensive chambers have been excavated in the rocks; many portions of escarpment are elaborately sculptured; and the massive foundations of a vast temple or palace can still be traced. The date and origin of these ruins have given rise to much discussion. Dr Barth thinks the city was probably founded by Cyaxares, the Mede, and explains the groups of sculpture as commemorating the peace between Cyaxares and Alyattes, which is described by Herodotus in the 74th chapter of his 1st book. M. Texier's hypothesis, on the other hand, is that the carvings represent the introduction of the worship of Astarte into Phrygia; and this interpretation has been provisionally accepted by Van Lennep, in whose *Travels in Asia Minor*, 1870, carefully-drawn copies of the sculptures will be found. (See also Barth, *Reise von Trapezunt nach Scutari*, 1860, and in *Monatsbericht der Berl. Akad. der Wissensch.*, Febr., 1859.)

**BOGODUKHOFF**, a town of Russia, in the government of Kharkoff, about 43 miles N.W. of that city, in 50° 10' N. lat. and 36° 32' E. long., on the sandstone heights along the River Merl. There seems to have been a settlement on this site as early as 1571, and in 1681 it is spoken of as a town. In 1709, at the time of the Swedish war, Bogodukhoff was taken by Menschikoff and the Emperor Alexis Petrovitch. There are still remains of the ramparts and ditches with which it was formerly surrounded. The town contains four churches and a cathedral (of the Assumption, built in 1793), a hospital, and an almshouse. The inhabitants are chiefly engaged in agriculture and gardening, and in the manufacture of boots, caps, and furrowed gowns. Tanning also is carried on to some extent. The trade is principally in grain, cattle, and fish. There are two weekly markets and six annual fairs. Population in 1860, 10,522.

**BOGOMILI**, a heretical sect of the Greek Church, who came into notice during the 12th century. In origin they are probably Bulgarian, and their name appears to be a compound of the Slavonic words *Bog*, God, and *milui*, have mercy. In doctrine they are closely assimilated to the Euchites of the preceding century, and they may be looked on as an offshoot of that older sect. The peculiarity of their system of belief is the place assigned to Satan, who, under his original name Satanael, is held by them to be the first-born son of God. But Satanael, though seated at the right hand of his father and endowed with universal sway, was discontented and desired to become independent. He

led away a section of the angels from their allegiance, and with their aid formed out of chaos a new world—the earth, and a new race—man. But he was unable to give to man a portion of his own living spirit, and therefore besought God to bestow life on this new creation, promising that the vacant places of the seceded angels should be filled up by the spirits of men. Repenting of this promise, however, he resolved to bring forth an evil race which should overwhelm the good among mankind. He accordingly seduced Eve, who gave birth to Cain, the first of the descendants of the evil principle. His power also enabled him to deceive the greater part of mankind, particularly the Jews, to whom he represented himself as Jehovah. At last God sent out from himself the *Logos*, or angel Michael, who came upon earth in an ethereal form which was in appearance only an earthly body. Christ overcame Satanael, and deprived him of his creative power, *El*, from which time he is called Satan. Christ then ascended and took his place beside the Father, who again sent forth an emanation, the Holy Ghost, for the comfort and edification of believers. In church observances the Bogomili were equally heterodox. They rejected baptism by water only, and made the ceremony consist of prayer, and of laying on the head of the convert the gospel (probably apocryphal) of St John, and the hands of the congregation. As they rejected the symbol of water in baptism so they refused to admit such symbolic rites as the Lord's supper, which they looked upon as an offering to evil spirits. They were averse to all images, even to the cross. The Bogomili suffered persecution from Alexius Comnenus, who put to death their leader Basilus, and they were condemned by a synod of Constantinople in 1140. They lingered on, however, in and about Philippopolis, and opinions nearly identical with theirs are to be met with among the later Catharists. (See the *Church Histories* of Neander and Gieseler.)

**BOGOTA**, or **SANTA FÉ DE BOGOTA**, the capital of the United States of Colombia, in South America, is situated in the state of Cundinamarca, in 4° 6' N. lat. and 78° 30' W. long. It occupies a fine position at the base of the mountains La Guadalupe and Montserrat, on a table-land that forms part of the eastern ridge of the Andes, between the extensive valley of the Magdalena and the plains that are watered by part of the Orinoco system. The surrounding country is exceedingly fertile, and produces abundant crops of wheat and barley and the leguminous plants cultivated in Europe. The city of Bogota is the finest in the republic; its streets are well built, and run at right angles to each other; and within recent years most of them have been supplied with side pavements. The private houses are built of sun-dried bricks, and white-washed; and owing to the prevalence of earthquakes they are mostly of one story in height. Of the streets the largest and finest is the Calle-Real or Calle de la Republica, which ends in a large square or plaza containing some of the chief buildings in the city. The cathedral, rebuilt in 1814, possesses very little external beauty; but its interior is fitted up with considerable elegance, its ornaments are rich and valuable, and the image of the Virgin, the patron saint, is covered with a profusion of precious stones. There are about thirty other churches in the city, but many of them are in a state of decay, while several of the monastic buildings are appropriated to secular uses,—the religious communities having been dissolved by Mosquera, and their revenues devoted in great measure to educational purposes. The convent of San Francisco is of great extent, and contains some of the productions of Vasquez, a native artist of merit. A large and elegant building—a capitol, for the reception of Congress and for the various offices of state—is now (1875) in course of erection. Besides the university there are three endowed colleges, a school of

chemistry and mineralogy, a national academy, a public library, a botanic garden, and a military school, which is supported out of the public funds, and has produced some good engineers. The mint, one of the three in the republic, is a large and handsome building, and is well supplied with the necessary machinery. There are manufactures of soap, cloth, leather, and the precious metals; an active trade is carried on; and the neighbourhood is rich in minerals of various kinds. The population in 1800 amounted to 21,464, exclusive of strangers and temporary residents; in 1821 it was estimated at 30,000, and in 1870 at about 52,000. Santa Fé de Bogota was founded in 1538 by Gonzalez Ximenes de Quesada, and received its name from his birthplace Santa Fé, with the addition of Bogota, in honour, it is said, of a native prince of that time. It soon increased in size and importance, and became the capital of the Spanish vice-royalty of New Granada. In 1811 the citizens threw off the Spanish yoke and a republic was proclaimed; the city, however, in 1816, fell into the hands of Murillo, the Spanish general. Delivered by Bolivar in 1819 it was made capital of the republic of Colombia; on the separation of the three states it remained the chief city of New Granada, and it is now the capital of the United States of Colombia, forming itself an independent federal territory. It is the seat of the supreme court and the other offices of the Federal Government, and the residence of the foreign diplomatic representatives.

BOGRA, correctly BAGURÁ, a district in the Rájsháhí division, within the Lieutenant-Governorship of Bengal, situated between 25° 20' and 24° 20' 28" N. lat., and 88° 55' 30" and 89° 49' 25" E. long. It is bounded on the N. by the districts of Dinájpur and Rangpur, on the E. by the districts of Rangpur and Maimansingh, on the S. by the district of Pabná, and on the W. by the districts of Rájsháhí and Dinájpur. The revenue area of the district in 1870 was 2000 square miles, of which 1750 were returned as under cultivation, 125 as cultivable but not actually cultivated, and 125 as uncultivable waste. The census of 1872 returned the police area of the district at 1500 square miles, and disclosed a population of 689,467 souls, of whom 556,620, or 80 per cent., were Mahometans, 130,644, or 19 per cent., Hindus; 22 Christians, and 2181 were classified as "others." Density of population in the census area, 59 per square mile. The district stretches out in a level plain, intersected by numerous streams and dotted with patches of jungle. The Karatoyá River flows from north to south, dividing the district into two portions, possessing very distinct characteristics. The eastern tract consists of rich alluvial soil, well watered, and subject to fertilizing inundations, yielding heavy crops of coarse rice, oilseeds, and jute. The western portion of the district is high-lying and produces the finer qualities of rice. The principal rivers are formed by the different channels of the Brahmaputra, which river here bears the local names of the Konái, the Dáokobá, and the Jamuná, the last forming a portion of the eastern boundary of the district. Its bed is studded with alluvial islands. The Brahmaputra and its channels, together with three minor streams, the Bángálí, Karatoyá, and Alai, afford admirable facilities for commerce, and render every part of the district accessible to native cargo boats of large burden. The rivers swarm with fish,—the value of the fisheries being estimated at £45,000 a year. The principal products of the district are rice, peas, pulses, oilseeds, jute, sugar cane, mulberry, red pepper, and hemp for smoking (*Cannabis indica*). These products, together with clarified butter and a little silk, form the chief articles of export. The imports consist of salt, cloth, tobacco, areca-nuts, copper and brass utensils, spices, iron and piece goods. The chief trading markets are Bográ, Lakhmiganj, Buriganj,

Dhupcháchia, &c. A silk factory has been established at Naodápára, and is conducted with European capital, with an annual outlay of about £4500. The revenue and expenditure of the district have steadily increased of late years. In 1853 the total revenue of the district amounted to £48,431, and the civil expenditure to £7282; in 1860, revenue £57,744, and civil expenditure £11,013; in 1870–71 the revenue had risen to £59,979. In 1870–71 the district contained 1064 separate estates held by 2497 proprietors, paying a total Government land revenue of £44,347. The machinery for protecting person and property consists of six magisterial and six civil courts, with (1) a regular police force, numbering 54 officers and 252 men, and costing Government £5975; (2), a rural constabulary or village watch, numbering 2552 men, and costing £6635, paid by the landholders and villagers, and (3), municipal police, numbering 36 men, and costing £251. In 1871–72 there were 41 Government and aided schools in the district, attended by 1492 pupils, and maintained at a total cost of £1398, of which £692 was contributed by the estate. The total number of aided and unaided schools in the district is returned in the census of 1872 at 169, attended by 1685 pupils. The only town containing upwards of 5000 inhabitants in the district is Bográ, the administrative headquarters, situated on the Karatoyá River; population in 1872, 5872; municipal income, £282; expenditure, £208; rate of taxation per head, 11½d. There is one other municipality, Sherpur, formerly a place of importance when the East India Company had silk filatures in its neighbourhood. A great part of this town is now overgrown with jungle, the municipal income in 1869 was £246, the expenditure £174. The climate of Bográ is mild during the winter, but sultry and oppressive at other seasons. The average annual rainfall for the five years ending 1869 was 82 inches, and the average annual temperature 77° Fahr.

BOHADDIN, or, more properly, BOHA-EDDYN, an eminent Arabian writer and statesman, better known in the East under the appellation of IBN-SJEDDAD. He was born at Mosul 1145 A.D. (539 A.H.), and early became eminent in the study of the Koran, as well as in jurisprudence. At the age of twenty-seven he obtained the place of lecturer at Baghdad, and, soon after, a professor's chair at Mosul. In 1187 he made the pilgrimage to Mecca, and then proceeded to visit Jerusalem and Hebron. In passing through Damascus he was sent for by Saladin, who was then employed in the siege of Kanesh. Bohaddin observed as he himself mentions (*Vita Saladini*, c. v.), that the whole soul of the monarch was engrossed by the war which he was then waging against the enemies of the faith, and saw that the only mode of acquiring his favour was by urging him to its vigorous prosecution. With this view he composed a treatise on the *Laws and Discipline of Sacred War*; and this work, on his return, he presented to Saladin, who received it with peculiar favour. Bohaddin, from this time, remained constantly attached to the person of the sultan, and was employed in various important embassies and departments of civil government. He was also appointed judge of the army, and judge of Jerusalem. After Saladin's death Bohaddin was active in securing the throne to his son, Melik-al-Dhaker, and was by that prince created *cadi* of Aleppo. He then founded a college in that city of which he himself was the principal professor. When Melik-al-Dhaker died, his son Melik-al-Aziz was a minor, and Bohaddin obtained the principal sway in the regency. This gave him an opportunity of introducing learned men at court, and loading them with honours. As the prince, however, approached to manhood, Bohaddin, though he still retained his offices, found it expedient to retire from court. Even after he was unable to go to college, he continued to

give lectures in his own house, and he persevered in these learned labours till the age of ninety, when he died 1235 A.D. (633 A.H.) Bohaddin wrote on jurisprudence and Muslim divinity; but his principal work is his *Life of Saladin*, which, with several other pieces connected with the same subject, was published by Schultens, at Leyden, in 1732, accompanied by a Latin translation, with notes and a geographical index. This work affords a favourable specimen of the historical compositions of the Arabs. It is written with some spirit, and yet is free from inflation which so frequently disfigures Oriental composition. Whatever relates to Saladin breathes the highest tone of panegyric; yet the enthusiasm with which everything concerning him is narrated, and the anecdotes which the author, from his personal knowledge, is able to communicate respecting that extraordinary character, give his work a great degree of interest.

BOHEMIA (German BOHMEN or BOHEIM), a kingdom of the Austrian empire, situated between 48° 33' and 51° 4' N. lat. and 12° 5' and 16° 25' W. long., and bounded on the N. by Saxony and Prussian Silesia, E. by Moravia, S. by Upper and Lower Austria, and W. by Bavaria. Its area is estimated at 19,983 square miles. It belongs almost entirely to the basin of the Elbe, which rises within the territory, and is joined by the Adler, the Iser, the Moldau, and the Eger before it passes the frontier. The boundaries are pretty clearly marked by mountain ranges on all sides,—the Böhmerwald dividing the country from Bavaria, the Erzgebirge and Riesengebirge from Saxony and Silesia, and the Moravian Hills from the basin of the Danube. The climate is healthy, but varies considerably in different districts; the soil in many parts is highly fertile, and grain of various kinds, potatoes, hops, flax, hemp, vines, and fruits are extensively cultivated. In 1870 there were 6,205,161 acres of ploughed land, 2656 in vineyards, 1,560,321 in gardens and meadows, 995,340 in pasture, and 3,749,411 in woodland. At the same date the number of horses in the country was 189,337, cattle 1,602,015, sheep 1,106,290, goats 194,273, swine 228,180, and bee-hives 140,892. The mineral productions comprise gold, silver, lead, tin, copper, iron, cobalt, bismuth, arsenic, sulphur, coal, alum, vitriol, and different sorts of stone. In 1870 there were obtained 156 cwt. of gold-ore, 1245 of silver-ore, 225,536 tons of iron, 999 tons of lead, 2274 of tin, 61 tons of antimony, and 111 of arsenic-ore. The quantity of coal and lignite amounted to 4,099,909 tons. The mineral springs of Bohemia—Carlsbad, Teplitz, Marienbad, and Franzensbrunn, &c.—are justly famous. The industry of the kingdom is highly developed in various directions. Most important of all is the manufacture of woollen goods, principally carried on at Reichenberg and in the neighbourhood. The cotton manufacture is also extensively prosecuted in the same district; and at Rumburg and other places linen stuffs are largely produced. Bohemian glass has been celebrated for centuries, and is still exported to all parts of Europe. Porcelain and earthenware of different sorts, iron and steel wares, copper, tin, and pewter articles, wooden wares, chemical stuffs, and paper are all the objects of a considerable industry. Beetroot sugar is pretty largely manufactured, the refineries numbering 126 in 1870. At the same date there were 968 breweries in the country, and 324 brandy distilleries. The chief commercial city is the capital, Prague; but Reichenberg, Pilsen, Haida, Rumburg, Leitmeritz, and Budweis are all important centres. Bohemia is divided into twelve circles—Prague, Budweis, Pisek, Pilsen, Eger, Saaz, Leitmeritz, Bunzlau, Jiczin, Königgrätz, Chrudim, Czaslau, and Tabor, and these are subdivided into 91 departments. In 1869 there were 372 towns, 226 smaller market towns, and 12,551 villages. The number of inhabited houses in the whole country amounted to

632,404; and the total population was 5,106,069, of whom 2,433,629 were males, and 2,672,440 females. The census of 1869 took no count of nationality, but according to Ficker in his *Die Völkerstämme der Oesterreichisch-Ungarischen Monarchie*, there are 20 of German race for 32 of Slavonic. By far the greater part of the population (4,940,898) belongs to the Roman Catholic Church; while only 3438 are members of the Greek Church, 106,115 Protestants, and 89,933 Jews. The country constitutes an archbishopric, and is divided into three bishoprics. In 1870 there were 140 ecclesiastical foundations, with endowments amounting to £65,726. At the head of the educational establishments is the University of Prague, with four faculties, and attended in 1871 by 1516 students. There are upwards of 4000 ordinary schools in rather more than the half of which Czech is spoken, 26 gymnasiums, 4 theological seminaries, and several institutions for special departments of the arts and sciences.

Bohemia derives its name from the Boii, a Celtic race expelled from the country by the Marcomanni, who, after establishing a considerable kingdom under Marbod and being converted to Christianity, were in their turn supplanted by the Slavonic race, which is still predominant. The new comers were in danger of expulsion or conquest by the Avars, but were defended and established, according to their own possibly mythical account, by the heroie Samo; and somewhat later, as the story goes, his place was filled by the good knight Krok, whose daughter Libussa, marrying Premysl, became the founder of a regular dynasty. Bohemia was for a time absorbed in the great Carolingian monarchy, but soon reasserted its independence. In the course of the 9th century Christianity was introduced. Under Boleslas I. the bounds of Bohemia were extended and its unity secured; but after a vigorous defence he had to recognize the overlordship of Otto I. of Germany. Under his grandchildren his kingdom fell to pieces; a Polish conquest followed, and the restoration of the native dynasty was only effected by the help of Henry II. of Germany. In 1086 Wratlas II. received the title of king from the emperor for himself; and Premysl Ottocar I. (1197–1230) became the founder of a hereditary series of kings. He was a bold defender of his independence, and at the same time gave great encouragement to German immigration. By the introduction of the right of primogeniture in the succession to the throne, he put an end to the disputes and contests which so often followed the death of a king. In 1241 his son and successor was the successful defender of Europe against a Mongolian invasion; but he was eclipsed by Ottocar II. (1253–1278), who added greatly by conquest to the extent of his dominions, and made himself a formidable rival to the emperor himself. The Premysl dynasty was at last extinguished in 1306; and after a few years of uncertainty and dissatisfaction the Bohemian crown was bestowed on John of Luxembourg (son of the Emperor Henry VII.), who thus became the founder of a dynasty which lasted till 1437. This warlike and prosperous monarch was succeeded by his son Charles I., who obtained the imperial dignity as Charles IV., and left Bohemia in a flourishing and influential position at his death in 1378. Under his successors, who fell far below the character of their ancestor, the country was thrown into confusion by the Hussite reformation, which resulted in a protracted war (1419–1434). The success of the reforming party led to an elective monarchy, and after various vicissitudes, George of Podiebrad mounted the throne in 1458; and in spite of Papal bull and Hungarian arms maintained his position till his death in 1471. His successor, the Polish prince Ladislas, ultimately obtained also the crown of Hungary; but under him and his son Louis (1517–1526) the nobility made themselves more and

more independent of the king, and the common people were crushed deeper into serfdom. On the death of Louis, in a battle against the Turks at Mohacz, Bohemia passed into the hands of Ferdinand of Austria, who treated the kingdom in the most despotic manner, and in 1547 declared it a hereditary possession. He was followed in succession by his son Maximilian II and his grandson Rudolph II, who left the country as distracted as they found it. The son of Matthias, the next king, was rejected by the Protestant party, which chose in his stead Frederick V. of the Palatinate; but the victory at the White Mountain in 1620 left Bohemia at the mercy of the emperor, who inflicted a terrible vengeance on his enemies, and in 1627 declared the country a purely Catholic and hereditary kingdom of the empire. Owing to this no fewer than 30,000 families are said to have gone into exile and the population of the country was reduced to 800,000. On the death of Charles VI. Charles Albert of Bavaria laid claim to the crown, which continued to be an object of dispute though the Silesian campaigns and the Seven Years' War, but was successfully defended by Maria Theresa and her son Joseph II. The country was greatly benefited in many ways by the government of that monarch; but he destroyed the independence of the royal towns, and treated the whole land as a mere province of the empire. Its religious condition was considerably improved, however, by an edict of toleration published in 1781. Under the succeeding reigns the circumstances of Bohemia underwent but little alteration, and it was hardly affected by the first French Revolution. In 1848, however, a determined "national" movement agitated the country. The demands of the Liberal party gradually increased, and nothing short of a full share in the constitutional government of their country would suffice. The movement was not confined to Bohemia, but spread through the whole Austrian empire, to the article on which (p. 137 of the present volume) the reader is referred. (See Freher, *Rerum Bohemicarum Antiqui Scriptores*, 1602; Dobner, *Monumenta Historica*, 1761-68; Pelzel, *Geschichte der Böhmen*, 1817; Palacky, *Geschichte von Böhmen*, 1839; Jordan, *Geschichte des böhm. Volks und Landes*, 1845-47.)

The Bohemians or Czechs speak a Slavonic language, which has been subjected to literary culture from about (if not before) the 9th century. A few fragments of a pre-Christian literature have been preserved in a manuscript discovered by Hanka in 1817 in the church-steeple of Königinhof; but the first productions of any extent are due to the activity of the early German Christians, and are composed for the most part in the Latin language. Against this powerful exotic speech the vernacular had a long and dubious struggle, especially in the ecclesiastical domain, and it was still striving against its encroachments when the political circumstances of the nation exposed it to the more dangerous, because more popular and less artificial, rivalry of German. From the court and the capital outward over the nobility and the country there spread a Germanizing energy that at first seemed likely to destroy everything that was distinctively Bohemian; but here and there the national language and customs were fostered and preserved by a few patriotic spirits, among whom the monks of the Slavonic monastery of Sazawa were especially conspicuous. At length the native language obtained the imperial patronage (under Charles IV.) Dalmlil wrote his *Rhyming Chronicle of Bohemia* (1314); and translations began to be made from Latin and other languages. Among these were Mandeville's *Travels*; and about the end of the 14th century a complete version of the Scriptures, the manuscript of which is preserved at Nikolsburg in Moravia. Thomas Stitny the domestic moralist, Duba the jurist, and Flaska the didactic poet,

deserve to be mentioned as original writers. The next generation saw the attempts at once at religious and at linguistic reform that came to so sad an end in the burning of John Huss and the persecutions that followed. The Bohemian language was, indeed, brought into general use and served the disputants of both sides; but little was consigned to its keeping except the ephemeral productions of ecclesiastical and political strife. A large collection of these works, saved from destruction by the invading Swedes, is still preserved in the library of Stockholm. Of more permanent interest may be mentioned Paul Zidek's *History of the World*, written for George of Podiebrad; the interesting travels of Leo of Rosmítal and his companions through various countries of Europe; and those of Kabatnik in Egypt and Asia Minor, and of John of Lobkowitz in Palestine. The 16th century saw a remarkable development of Bohemian prose in various departments of literature. Weleslawin, Paprocky, and Hayek of Liboczun wrote popular histories; Wratislaw of Mitrovic and Prefat of Wilkanow gave accounts of their travels; and Nicolas Konec, Dobrensky, and Lomnický produced didactic works of different kinds. A valuable translation of the Bible was published at Kralitz in Moravia by eight learned Bohemian Brethren at the instigation of John of Zerotin; and various versions of the classics appeared from time to time. A long period of literary decadence followed the battle of the White Mountain in 1620. The best blood of the nation went into exile, and what Bohemian literature was produced appeared for the most part in foreign cities. In 1774 a severe blow was struck at the native language by Maria Theresa's imperial decree which enforced the use of German in the higher and middle schools of the country. Before long, however, the defence of the mother tongue was taken up by Count Kinsky, Hanka of Hankenstein, the historian Pelzel, and the Jesuit Balbin,—by the last mentioned in a *Dissertatio apologetica pro lingua Bohemica*. The language became the object of the scientific investigations of Dobrowsky, and the remains of the early periods were edited by Dobner, Prochazka, and other philologists. A chair of the Bohemian language was founded in the University of Prague, and in 1818 a Bohemian museum was established in connection with a society that devoted itself to the study of national antiquities, and published a valuable journal. Puchmayer (1795-1820) gave an impulse to national poetry, and has been succeeded by Langer, Roko, Woel, Schneider, Czelakowsky, and Kollar, and a great number of other writers. In the department of science Presl, Sadek, Amerling, Smetana, Petcina, Sloboda, and Opiz have attained distinction. Grammars of the Czech language have been produced by Burian, Hanka, Maly, Sembera, and Tomeck; Sumawsky published a great German-Bohemian dictionary; Spatny, a Bohemian-German and German-Bohemian technological dictionary; and Jungmann a large Bohemian-German lexicon. The names of even the prominent writers in philosophy, theology, and politics are too numerous to be mentioned. (See Schafarik's *Slavisch Alterthümer*, 1842, and *Geschichte der Slav. Sprache*, 1826; Jungmann's *Geschichte der böhm. Sprache und Literatur*, 1825.)

BOHEMOND, MARC, one of the leaders of the Crusades, born about 1056, was the eldest son of Robert Guiscard, a Norman, who had obtained by conquest the dukedom of Apulia and Calabria. From 1081 to 1085 he served under his father in a war against the Byzantine emperor Alexander Comnenus, whom he twice defeated, though he had to return to Italy without reaping any substantial fruits of his success. In 1085 his father died, leaving Apulia and Calabria to a younger son, while Bohemond obtained only the small principality of Tarentum. A war between the

brothers followed, from which, however, Bohemond was speedily diverted by the Crusades, which opened up a wider field for his ambition. Accompanied by his cousin Tancred, he led an army of 10,000 cavalry and 20,000 infantry, with which he would have besieged Constantinople had he been able to persuade Godfrey of Bouillon to join him. He took a leading part in the battle of Dorylaeum (1097), and the other engagements of the campaign in Asia Minor. A year later he besieged and captured Antioch, of which he assumed the principality. In 1101 he was defeated and taken prisoner by the Turks. Released, after a captivity of two years, on the payment of a very heavy ransom, he returned to Europe to collect troops. In 1106 he visited France, and married Constance, a daughter of Philip I. With an army levied in France, in right of his marriage, he renewed war with Alexius, but being unsuccessful in the siege of Durazzo he was obliged to conclude a peace in 1108. He died at Canossa in Apulia in 1111 (See Gibbon's *Decline and Fall*, c. lviii, lx., and Michaud's *Histoire des Croisades*.)

BOIARDO, COUNT MATTEO MARIA, of a noble and illustrious house established at Ferrara, but originally from Reggio, was born at Scandiano, one of the seignorial estates of his family, near Reggio di Modena, about the year 1434, according to Tiraboschi, or 1420 according to Mazzuchelli. At an early age he entered the University of Ferrara, where he acquired a good knowledge of Greek and Latin, and even of the Oriental languages, and was in due time admitted doctor in philosophy and in law. At the court of Ferrara, where he enjoyed the favour of Duke Borso d'Este and his successor Hercules, he was entrusted with several honourable employments, and in particular was named governor of Reggio, an appointment which he held in the year 1478. Three years afterwards he was elected captain of Modena, and reappointed governor of the town and citadel of Reggio, where he died in the year 1494, though in what month is uncertain. Almost all his works, and especially his great poem of the *Orlando Innamorato*, were composed for the amusement of Duke Hercules and his court, though not written within its precincts. His practice, it is said, was to retire to Scandiano or some other of his estates, and there to devote himself to composition; and Castelvetro, Vallisneri, Mazzuchelli, and Tiraboschi, all unite in stating that he took care to insert in the descriptions of his poem those of the agreeable environs of his chateau, and that the greater part of the names of his heroes, as Mandricardo, Gradasse, Sacripant, Agramant, and others, were merely the names of some of his peasants, which, from their uncouthness, appeared to him proper to be given to Saracen warriors. Be this as it may, the *Orlando Innamorato* deserves to be considered as one of the most important poems in Italian literature, since it forms the first example of the romantic epic worthy to serve as a model, and, as such, undoubtedly produced the *Orlando Furioso*. Gravina and Mazzuchelli have said, and succeeding writers have repeated on their authority, that Boiardo proposed to himself as his model the *Iliad* of Homer; that Paris is besieged like the city of Troy; that Angelica holds the place of Helen, and that, in short, the one poem is a sort of reflex image of the other. In point of fact, however, the subject-matter of the poem is derived from the *Fabulous Chronicle* of the pseudo-Turpin; though, with the exception of the names of Charlemagne, Roland, Oliver, and some other principal warriors, who necessarily figure as important characters in the various scenes, there is little resemblance between the detailed plot of the one and that of the other. The poem, which Boiardo did not live to finish, was printed at Scandiano the year after his death, under the superintendence of his son Count Camillo. The title of the book is without date; but a Latin letter from Antonia Caraffa di

Reggio, prefixed to the poem, is dated the kalends of June 1495. A second edition, also without date, but which must have been printed before the year 1500, appeared at Venice; and the poem was twice reprinted there during the first twenty years of the 16th century. These editions are the more curious and valuable, that they contain nothing but the text of the author, which is comprised in three books, divided into cantos, the third book being incomplete. But Niccolo degli Agostini, an indifferent poet, had the courage to continue the work commenced by Boiardo, adding to it three books, which were printed at Venice in 1526-1531, in 4to; and since that time no edition of the *Orlando* has been printed without the continuation of Agostini, wretched as it unquestionably is. Boiardo's poem suffers from the incurable defect of a laboured and heavy style. His story is skilfully constructed, the characters are well drawn and sustained throughout; many of the incidents show a power and fertility of imagination not inferior to that of Ariosto, but the perfect workmanship indispensable for a great work of art is wanting. The poem in its original shape was not popular, and has been completely superseded by the *Rifacimento* of Francesco Berni. See BERNI.

The other works of Boiardo are—1. *Il Timone*, a comedy, Scandiano, 1500, 4to; 2. *Sonnetti e Canzoni*, Reggio, 1499, 4to; 3. *Carmen Bucolicum*, Reggio, 1500, 4to; 4. *Cinque Capitoli in terza rima*, Venice, 1523 or 1533; 5. *Apulejo dell' Asino d'Oro*, Venice, 1516, 1518; 6. *Asino d'Oro de Luciano tradotto in volgare*, Venice, 1523, 8vo; 7. *Erodoto Alicarnasseo istorico, tradotto di Greco in Lingua Italiana*, Venice, 1533 and 1538, 8vo; 8. *Rerum Italicarum Scriptores*. (See Panizzi's *Boiardo*, 1830-31.)

BOIELDIEU, FRANÇOIS-ADRIEN, is the chief representative of the national school of comic opera in France, a branch of art in which everything that is most lovable and at the same time most rational in the French character has found its full expression. He was born at Rouen in 1775, and received his first musical education from M. Broche, the organist of the cathedral of that city. It is said that, when quite a youth, in order to escape the punishment of a severe master for a slight offence, he went off to Paris on foot, but was discovered and brought back by his parents. He began composing songs and chamber music at a very early age,—his first opera, *La Famille Suisse*, being produced on the stage of Rouen in 1795, where it met with an enthusiastic reception. Not satisfied with his local success he turned his eyes to that loadstar of youthful ambition, Paris. He went to the capital in 1795, full of hope and expectation. The score of his opera was submitted to the leading musicians of the day, such as Cherubini, Méhul, and others, but met with little approbation. Altogether the time was not favourable for the comic muse. The heroic passions roused by the revolutionary events of the preceding years required commensurate efforts of musical art; the grand opera was the order of the day. Boieldieu had to fall back on his talent as a pianoforte-player for a livelihood, and to wait for a chance of higher success in the meantime. This success came at last from a source whence it was little expected, and, perhaps, less desired. Garat, a fashionable singer of the period, admired Boieldieu's touch on the piano, and made him his accompanist. He also sung in the drawing-rooms of the Directoire the charming songs and ballads with which the young composer supplied him but too willingly. In this manner Boieldieu's reputation gradually extended to wider circles. In 1797 his above-mentioned opera appeared for the first time on a Paris stage, and was well received. Several others followed in rapid succession, of which only the last, *Le Calife de Bagdad* (1799), has escaped oblivion. It tends to show Boieldieu's true artistic vocation, that, after the enormous success of

this work, he felt the want of a thorough musical training, and voluntarily descended from the position of a successful *maestro* to that of a humble pupil. He took lessons from Cherubini, and the influence of that great master is distinctly discernible in the higher artistic finish of Boieldieu's later compositions. In 1802 Boieldieu, for the second time in his life, took to sudden flight, on this occasion in order to escape the domestic troubles caused by his marriage with a celebrated ballet-dancer of the Paris Opera. The frightened husband went to Russia, where he was received with open arms by the Emperor Alexander. During his prolonged stay at St Petersburg he composed a number of operas which it is unnecessary to name. He also set to music the choruses of Racine's *Athalie*, one of his few attempts at the tragic style of dramatic writing. In 1811 he returned to his own country, where the following year witnessed the production of one of his finest works, *Jean de Paris*. The charming coquetry of the queen of Navarre, the chivalrous *verses* of the king, the officious pedantry of the seneschal, and the amorous tenderness of the page—all this rendered in the finest touches that music, and only French music, is capable of, will not soon be forgotten. We pass over a number of other operas of lesser value, partly written in collaboration with other composers, and turn at once to the second and greatest masterpiece of Boieldieu's genius, his *Dame Blanche* (1825). The libretto, written by Scribe, was partly suggested by Walter Scott's *Monastery*, and several original Scotch tunes cleverly introduced by the composer add not a little to the melodious charm and local colour of the work. *La Dame Blanche* marks the highest development of the French school of comic opera. Orétry stood at the head of this school; Cherubini with his *Deux Journées* followed in his wake; Boieldieu, greater than both (in this particular branch of art), reached a perfection which was to some extent sustained by the works of Auber. Boieldieu's pupil, Adam, has in his *Derniers Souvenirs d'un Musicien* left a charming sketch of the genesis of Boieldieu's masterpiece. The chief characteristics of his style are an easy flow of graceful melodies, a refined though occasionally somewhat meagre instrumentation, admirable phrasing, and a most distinct enunciation of the words. The outer events of Boieldieu's career may be summed up in few words. For a long time he occupied the position of professor of composition and pianoforte at the Conservatoire; in 1817 he was made a member of the Institute. The *Dame Blanche* was his last opera but one. Soon after its production he was seized with a violent attack of pulmonary disease. To stop the rapid progress of the illness he travelled in Italy and the South of France, but fell a victim to it on October 8, 1834.

BOII, a Celtic people, who at an early date crossed the Alps and established themselves between the Po and the Apennines to the south of the Insubres and Cenomani. On the defeat of their neighbours the Senones by the Romans they joined the Etruscans against the conquerors, and were involved in the disastrous results of the battle at the Vadimonian Lake in 283 B.C. Equally unsuccessful in the following year, they formed a treaty of peace with the Romans, which they kept for a considerable time, till the encroachments of their conquerors led them to engage in the Great Gallic war of 225 B.C. From that period they continued to indulge their hostility on all occasions, and on the outbreak of the Punic wars gave valuable aid to the Carthaginians from time to time. At length their strength was broken by Scipio Nasica in 191 B.C.; a large proportion of their territory was appropriated and secured by the colonies of Bononia, Parma, and Mutina; and before long the whole race seems to have been constrained to recross the Alps. They betook themselves to that

district of country which is still called in consequence Bohemia; but before many centuries they were expelled by other hostile tribes and their separate existence as a people was lost.

BOILEAU-DESPREAU, NICOLAS, was born at Paris on the 1st November 1636. Crône, not far from the capital, has been frequently stated to be his birthplace, but the matter seems to be pretty nearly settled by the researches of M. Labat (*Recherches historiques sur l'Hôtel de la Préfecture de Police*), who has discovered the very house in the Rue de Jérusalem where the poet was born. He was educated at the College of Beauvais, and was at first destined for the legal profession. From this, however, after a short trial, he recoiled in disgust, complaining bitterly of the amount of chicanery which passed under the name of law and justice. To escape such a course of life he began to study for the church, and actually received a priory of a small annual value, but his wishes soon turned in another direction. He gave up his clerical profession, and, his father having left him a small provision sufficient for his wants, thenceforward devoted himself to letters. Such of his early poems as have been preserved hardly contain the promise of what he ultimately became. The first piece in which his peculiar powers were displayed was a satirical poem, *Adieu of a Poet to the City of Paris*, published in 1660. This was quickly followed by eight others, and the number was at a later period increased to twelve. A twofold interest attaches to the satires. In the first place the author skillfully parodies and attacks writers who at the time were placed in the very first rank, such as Chapelain, Cotin, Quinault, and Scudéri; he openly raised the standard of revolt against the older poets. But in the second place he showed, both by precept and practice, what were the poetical capabilities of the French language. Prose, in the hands of such writers as Descartes and Pascal, had proved itself a flexible and powerful instrument of expression, with a distinct mechanism and form. But except with Malherbe, there had been no attempt to fashion French versification according to rule or method. In Boileau for the first time appeared terseness and vigour of expression, with perfect regularity of verse structure. His fame was quickly established; he received a pension, and was made historiographer along with his friend Racine. In 1664 he composed his prose *Dialogue des héros de roman*, which is a refined satire on the elaborate romances of the time. It may be said to have once for all abolished them. From 1669 onwards appeared the *Epistles*, graver in tone than the satires, maturer in thought, more exquisite and polished in style. In 1674 his two master-pieces, *L'Art Poétique* and *Le Lutrin*, were published. The first, in imitation of the *Ars Poetica* of Horace, lays down the code for all future French verse, and may be said to fill in French literature a parallel place to that held by its prototype in Latin. On our own literature the maxims of Boileau, through the translation revised by Dryden, and through the magnificent imitation of them in Pope's *Art of Criticism*, have exercised no slight influence. Boileau does not merely lay down rules for the language of poetry, but analyses carefully the various kinds of verse composition, and enunciates the principles peculiar to each. Of the four books of the *Art Poétique*, the first and last consist of general precepts, inculcating mainly the great rule of *bon sens*; the second treats of the pastoral, the elegy, the ode, the epigram, and satire; and the third of tragic and epic poetry. Though the rules laid down are of value, their tendency is rather to hamper and render too mechanical the efforts of poetry. Boileau himself, though a great critic in verse, cannot be considered a great poet. The *Lutrin*, a mock heroic poem, of which four cantos appeared in 1674

is by French critics considered the best of Boileau's works. It has furnished the model for the *Rape of the Lock*, but the English poem is superior in richness of imagination and subtilty of invention. The fifth and sixth cantos, afterwards added by Boileau, rather detract from the beauty of the poem; the last canto in particular is quite unworthy of his genius. In the same year which saw the *Art Poétique* and the *Lutrin* was published his translation of Longinus *On the Sublime*, to which were afterwards added certain critical reflections. His later publications were chiefly occasional poems, in which his better powers did not shine. He died 13th March 1711. Boileau was extremely delicate in youth, and his constitution seems never to have been very strong. He was a man of warm and kindly feelings, honest, outspoken, and benevolent. Many anecdotes are told of his frankness of speech at court, and of his generous actions. He holds a well-defined place in French literature, as the first who reduced its versification to rule and who taught the value of workmanship for its own sake. His influence on English literature, through Pope and his contemporaries, was not less strong, though less durable. Editions of Boileau's works are very numerous. Perhaps the best is that published by Garnier in 1860, *Œuvres complètes*, with copious notes, an essay by Sainte-Beuve, and *Boileau*.

BOILER. See STEAM ENGINE.

BOIS-LE-DUC, 's HERTOGENBOSCH, or 's BOSCH, a city of Holland, capital of the province of North Brabant, 28 miles S.S.E. of Utrecht. It stands at the confluence of the Dommel and the Aa, and is strongly fortified, being defended by a citadel and two forts. The city is handsome and well built, and is intersected by several canals. It contains seven churches, among which is that of St John, founded in the beginning of the 14th century, and one of the finest ecclesiastical edifices in Holland. It has also a handsome town-hall, surmounted by a tower containing a fine set of chimes, a court-house, Government buildings (formerly a Jesuit monastery), an episcopal palace, an orphan asylum, a grammar school (once attended by Erasmus), a prison, two hospitals, an arsenal, and barracks. The trade of Bois-le-Duc is very considerable; it has several distilleries, breweries, and glass-works, and manufactures linen, needles, cutlery, &c. It is the seat of a vicar-general, and has tribunals of primary instance and commerce. Originally a hunting-lodge of the Brabant dukes, 's Hertogenbosch, or "Duke's Wood," gradually increased, and in 1184 was raised to the rank of a town and surrounded with walls. In 1453 it was greatly enlarged. Successive attempts made by the Netherlands in 1585, 1594, 1601, and 1603 to get possession of the town were futile; but at length, in 1629, it was captured after a five months' siege. In 1794 it was taken by the French, and in 1814 by the Prussians. Population in 1869, 24,395.

BOISSARD, JEAN JACQUES, a classical antiquary and Latin poet, was born at Besançon in 1528. He studied at Louvain; but, disgusted by the severity of his master, he secretly left that seminary, and after traversing a great part of Germany reached Italy, where he remained several years, and was often reduced to great straits. His residence in Italy developed in his mind a taste for antiquities, and he soon formed a collection of the most curious monuments of Rome and its vicinity. He then visited the islands of the Archipelago, with the intention of travelling through Greece, but a severe illness obliged him to return to Rome. Here he resumed his favourite pursuits with great ardour, and having completed his collection, returned to his native country; but not being permitted to profess publicly the Protestant religion, which he had embraced some time before, he withdrew to Metz, where he died, October 30, 1602. His works are—

1. *Poemata, Epigrammatum libri tres, Elegiæ libri tres, Epistolarum libri tres*, Basel, 1574; 2. *Emblemata*, Metz, 1584; 3. *Icones Virorum Illustrium*, 1597, sqq.; 4. *Vitæ et Icones Sullanorum Turcicorum*, &c., Frankfort, 1596; 5. *Theatrum Vitæ Humanae*, Metz, 1596; 6. *Romanæ Urbis Topographiæ et Antiquitatum, quibus succinde et breviter describuntur omnia quæ tum publice quàm privatim videntur animadversione digna, partes VI.*, Frankfort, 1597-1602, folio, six volumes in three, with plates, and now very rare; 7. *Icones et Vitæ Virorum Illustrium*, Frankfort, 1592 to 1599; 8. *Parnassus Biceps*, Frankfort, 1601; 9. *De Divinatione et Magicis Præstigiis*, Oppenheim and Hanau, rare and curious; 10. *Habitus Variarum Gentium*, Metz, 1581, ornamented with seventy illuminated figures.

BOISSONADE, JEAN FRANÇOIS, French classical scholar, was born at Paris, 12th August 1774. In 1792 he entered the public service during the administration of General Dumouriez. Driven from it in 1795, he was restored by Lucien Bonaparte, during whose time of office he served as secretary to the prefecture of the Upper Marne. He then definitively resigned public employment and devoted himself to the study of Greek, for which he had always a strong inclination. In 1809 he was named professor of Greek at the faculty of letters at Paris, though he did not assume the title till the death of Larcher, who held the chair, in 1812. In 1828 he succeeded Gail in the chair of Greek at the Collège de France. He also held the offices of librarian of the Bibliothèque du Roi, and perpetual secretary of the Academy of Inscriptions. He died 12th September 1857. Boissonade's works consist mainly of editions of several less known classical writers, such as Philostratus, Marius, Eupapius, Aristænetus. Perhaps his most widely known editions are those of Babrius (1844), and of Tzetzes (1851). The *Anecdota Græca*, 5 vols. (1829-33), and *Anecdota Nova* (1844) contain many interesting and comparatively unknown writings. Boissonade was a contributor to the *Journal des Débats* and other critical journals, and a selection of his papers has been published by M. Colincamp, *Critique littéraire sous le premier Empire*, 2 vols., 1863.

years, residing at Athens. Its first session began in 1882, with seven students. The first executive committee was composed as follows: John Williams White, Harvard; Henry Drisler, Columbia; Basil L. Gildersleeve, Johns Hopkins; E. W. Gurney, Harvard; Albert Harkness, Brown; Thomas W. Ludlow, New York; Lewis R. Packard, Yale; Francis W. Palfrey, Boston; Fred J. DePeyster, New York; Wm. M. Sloane, College of New Jersey; Charles Eliot Norton, President of the Archaeological Institute; Wm. W. Goodwin, Director of the School at Athens. The co-operating colleges for 1890 were: Amherst, Brown, College of the City of New York, College of New Jersey, Colorado, Cornell, Dartmouth, Harvard, Johns Hopkins, Trinity University of the City of New York, University of Michigan, University of Missouri, University of Pennsylvania, Wellesley University, Wellesley College, Williams College, and Yale. Interesting work has been done determining localities and in exploration at Athens and in the neighborhood.

ATHENS, a thriving town of Tennessee, about fifty miles southwest of Knoxville. It is the seat of Grant Memorial University, formerly known as the East Tennessee Wesleyan University.

ATHERFIELD CLAY, the lowest sub-division of the Lower Greensand, varying in thickness from 20 to 60 feet. It rests directly on the Wealden. It takes its name from Atherfield, on the southwest coast of the Isle of Wight. It is of marine origin.

ATHERINE, a genus of small fishes, allied to the mullet family (*Mugilidae*), now separated into a distinct family, *Atherinidae*. They are of a rather slender form, but few of them exceed six inches in length; some are quite toothless; all the known species which are numerous, and found in the seas of different parts of the world, have a broad silvery band along each flank. Some are much esteemed for their delicacy. They all congregate in great shoals.

ATHEROMA, or fatty deposit, generally found in the tissue of aged persons, or those who have lived dissipated and ill-nourished lives. It is dangerous, inasmuch as it interferes with the elasticity of the arterial tube, rendering it more liable to injury, and less able to repair itself should any occur. Atheroma generally precedes aneurism. Cysts filled with matter resembling bread-sauce, which frequently occur in the scalp, are termed atheromatous tumors.

ANTHEROSPERMACEÆ, incomplete, aromatic, exogenous shrubs with cup-shaped involucre and the anthers of *Lauraceæ*; native of South America and New Holland.

ATHERSTONE, an old market-town of Warwickshire, England, 14 miles north of Coventry by rail. It has manufactures of hats, stockings, and ribbons. The birthplace of Dayton is near Atherstone. Population, 4,615.

ATHERTON, CHARLES GORDON, U. S. Senator, born in Amherst, N. H., July 1, 1801, died in Manchester, N. H., Nov. 15, 1853. He graduated at Harvard in 1822, and became a member of the bar three years later. He sat in the State legislature from 1832 to 1837, and was a member of Congress from 1837-43. From 1843 to 1849, and again in 1852, he was a Senator from New Hampshire.

ATHOLE (PLEASANT LAND), a district of 450 square miles, north of Perthshire in Scotland. It is chiefly composed of gneiss and quartz rock, with beds of primary limestone. It was once one of the best hunting districts of Scotland. In the pass of Killiecrankie, in this district, Claverhouse fell in 1689, though victorious over the troops of King William III.

ATKINSON, EDWARD, an American economist born in Brookline, Mass., Feb. 10, 1827. His education was obtained at private schools, and his reputation has been made by his numerous contributions to current literature on economic topics. Among his pamphlets and books are: *Cheap Cotton by Free Labor* (1861); *The Collection of Revenue* (1866); *Argument for the Conditional Reform of the Legal-Trade Act* (1874); *Our National Domain* (1879); *Labor and Capital—Allies, not Enemies* (1880); *The Fire Engineer, the Architect, and the Underwriter* (1880); *The Railroads of the United States* (1880); *Cotton Manufacturers of the United States* (1880); *Addresses at Atlanta, Ga., on the International Exposition* (1881); *What Is a Bank* (1881); *Right Methods of Preventing Fires in Mills* (1881); *The Railway and the Farmer* (1881); *The Influence of Boston Capital upon Manufactures* (1882); and *the Distribution of Products* (1885).

ATKINSON, GEORGE W., U. S. Congressman, born at Charleston, Kanawha county, W. Va., June 29, 1846. He graduated at the Ohio Wesleyan University, in 1870, studied law and was admitted to the bar in 1875. He was for four years U. S. marshal for the district of West Virginia, for six years postmaster of Charleston, W. Va., and for six years a revenue agent of the treasury department. He was elected as a Republican from West Virginia to the Fifty-first Congress.

ATKINSON, JONAS, M. A., D. D., M. E. clergyman, born in Deerfield, N. J., Sept. 6, 1835. He was admitted to the ministry in the New Jersey conference in 1853. He is the author of the hymn *We Shall Meet Beyond the River*, and has for more than thirty years contributed to various periodicals. He has published *The Living Way* (1856); *Memoirs of Methodism in New Jersey* (1860); *The Garden of Sorrows* (1868); *The Class Leader* (1874); and *Centennial History of American Methodism* (1884).

ATKINSON, LOUIS E., U. S. Congressman, born in Delaware township, Juniata county, Pa., April 16, 1841. He graduated at the medical department of the University of the City of New York in 1861, and entered the U. S. army the same year, serving until 1865, when he was mustered out. He then studied law and was admitted to the bar in 1870. He was elected as a Republican from Pennsylvania to the Forty-eighth, Forty-ninth, Fiftieth and Fifty-first Congresses.

ATKINSON, THOMAS, Episcopal bishop, born in Mansfield, Va., Aug. 6, 1807, died in Wilmington, N. C., Jan. 4, 1881. He graduated in 1825, studied law, was admitted to the bar, and practiced for nine years. He studied for the ministry and was ordained deacon in Norfolk, Nov. 18, 1836. He became priest the following year, and was consecrated bishop in St. John's Chapel in New York, Oct. 17, 1853.

ATLANTA, capital and largest city of the State of Georgia. It is a great railroad center, and hence is often called the "Gate City" of the south. It is the county-seat of Fulton county, and a port of delivery, is salubriously situated 1,087 feet above sea-level, on a ridge which forms the water-shed between the gulf rivers and those of the South Atlantic slope. It was early known as the prosperous village of Marthasville, planted in an unbroken wilderness, a few years before. It received in 1847 its municipal charter as "the City of Atlanta." It was totally destroyed on the eve of General Sherman's famous "march to the sea," but, having risen speedily from its ashes and become the center of a vast system of inland trade and transportation, it was made in 1868 the capital of the State. The corner-stone of the new State-house (to cost one million dollars) was laid in 1885. The city

limits comprise a geometrical circle three miles in diameter; in the center of which, with the principal streets as radii, is the Union passenger depot. Other chief public buildings are the custom-house, the Kimball House and the opera-house. Atlanta is the seat of numerous important educational institutions, among which are Atlanta University, Clark University, Atlanta Medical College, Atlanta Female Institute, Southern Medical Institute, Means' Boys' High School, Seney and Washington Female Seminary, Steen's School, Orphan Free School, English and German Select School, and the Grammar and High Schools of the city. The International Cotton Exposition of 1881, and the Piedmont Exposition of 1887, were held in Atlanta. The tobacco trade of Atlanta is the largest south of Virginia, and her dealings in cotton, draught animals, dry-goods and agricultural and other implements are immense and rapidly increasing. Population in 1850, 2,572; in 1860, 9,554; in 1870, 21,879; in 1880, 37,409; in 1890, 65,514. See *Britannica*, Vol. III, p. 15.

**ATLANTES**: in architecture, so called by the Greeks in reference to the mythical Atlas. They are male figures used instead of columns. The Romans called them *Telamones*. Female figures employed in this way are called *Caryatids* or *Caryatides*.

**ATLANTIC**, an important agricultural center of Iowa, county-seat of Cass county, situated on the east bank of East Nishnabotona River. It is the headquarters of an extensive canning industry, and deals largely in corn, wheat, oats and hay.

**ATLANTIC CITY**, a city of New Jersey, situated on the Atlantic coast, sixty miles southeast of Philadelphia. It is one of the most popular of the many fashionable sea-bathing resorts on the New Jersey shore. The beach is noted for its safety. Population in 1890, 13,038.

**ATLANTIC TELEGRAPH**. See **TELEGRAPH**, in these Revisions and Additions.

**ATLANTOSAURUS**, a name given by Professor Marsh to what appears to be the largest deinosaurian reptile of which any remains have been preserved. The femur of this colossal monster is more than eight feet in length. The size of the bone indicates a length for the animal of nearly 100 feet, and a height of 30 feet or thereabout. The remains were obtained in the Jurassic strata of Colorado.

**ATLAS**, a kind of silk-satin manufactured in the East. The word is Arabic, and means "smooth," "bare," hence it has been applied to smooth-silk cloth.

**ATLAS**, that piece of the human vertebral column which is nearest the skull. In other words, it is the first cervical vertebra. It may be known from the other six by its being without a body or spinous process, and by its being a mere irregular bony ring, partly divided into two unequal parts by a constriction. This division in the recent subject is completed by a ligament, the part in front being occupied by the tooth-like process of the second cervical vertebra, and that behind by the spinal marrow. On each side the ring is very thick, and it is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra.

**ATLEE**, WASHINGTON LEMUEL, an American surgeon and author, born in Lancaster, Pa., Feb. 22, 1808, died in the same place, Sept. 6, 1878. At the age of sixteen he began the study of medicine with his brother, Dr. John Light Atlee, and later he studied with Dr. George McClellan, after which he entered Jefferson Medical College, receiving his di-

ploma in 1829. Until 1834 he practiced in the village of Mount Joy, when he removed to Lancaster and practiced for the next ten years. In 1845 he became a professor in the medical department of the University of Pennsylvania, but resigned in 1853 and resumed his private practice. He was at the head of several medical societies, and is the author of valuable papers on medicine, chemistry and botany. Among them are *Ovarian Tumors* (1873); *Struggles and Triumphs of Ovariectomy* (1875); and *Fibroid Tumors of the Uterus* (1876); besides a prize essay on the same subject.

**ATMOLYSIS**, a method of separating a mixture of gases by taking advantage of their different rates of passage through a porous septum. This method was first made known in 1863 by its discoverer, Professor T. Graham, master of the English mint.

**ATMOMETER**, an instrument which can be used to determine the humidity of the atmosphere. It consists of a hollow ball of unglazed clay with a glass stem. The whole is filled with water and inverted in a dish of mercury. As the water, having passed into the pores, evaporates from the surface of the ball, the mercury rises in the stem. If much water vapor is present in the atmosphere, condensation takes place in the pores, and the mercury falls in the tube. The atmometer was invented by Sir John Leslie.

**ATOLLS**. See **CORALS**, *Britannica*, Vol. VI, p. 378.

**ATOMIC WEIGHTS**, the proportions by weight in which the various elementary substances unite. In all systems of atomic weights in modern use, the atomic weight of hydrogen is taken as unity, and the atomic weights of the other elements are then fixed so as to give on the whole the simplest and most consistent formulæ of their compounds. There are two systems of atomic weights at present in use. First, the "old" system, which, after a good deal of discussion, was generally adopted about 1845; and, second, the new system, which is in many respects, a revival of the system of Berzelius, and which may be said to have come into general use by scientific chemists about 1860.

**ATOMIZATION**, a process of converting liquid into diffused spray for purposes of inhalation, first introduced into France by Salas-Girons. It is effected by forcing a fine jet of liquid against either a solid body or a very strong current of air.

**ATONEMENT**, as simply an English word, is supposed to be derived from "at-one-ment"—that is, harmonious co-operation. The Hebrew term, *coffer*, or *kapher*, which is used throughout the Old Testament, and which we translate "atonement," signifies to hide or cover, and hence the use of the word in Scripture and among Christians with regard to the expiation of offenses or the covering up or blotting out of sin. Although "atonement" and "reconciliation" are occasionally accepted as synonymous, the words differ widely in meaning.

**ATONY**, in pathology, a want of tone, weakness of any organ, or debility of the whole body.

**ATRAULI**, a town of British India, in the North-west Provinces, 16 miles northeast of Aligarh. Founded about the 12th century, it is well built, with wide streets, a good bazaar, and an abundant supply of water. Population, 16,000.

**ATRIP**. An anchor is said to be atrip when it is just drawn out of the ground in a perpendicular direction. A top-sail is atrip when it is just started from the cap.

**ATROPIA**, or **ATROPINE**, an alkaloid existing in all parts of the deadly nightshade (*A. belladonna*) and in the seeds of the thorn-apple (*Datura stramonium*); it has also been called *daturia* or *daturine*.

It is so highly poisonous that no one has ventured to use it internally in medicine.

ATRYPA, fossil brachiopod shells of the Silurian and Devonian, but all Paleozoic.

ATTACHÉ, one attached to or connected with another, as a part of his suit or attendants. The term is specifically applied to young diplomatists on the staff of an ambassador.

ATTACHMENT, in law, the act of taking a person, or his goods or estate, by virtue of an order or writ issued by a court. The word may signify either the act or the writ. An attachment may be served upon a person to compel his attendance at court, or to punish for contempt, or to compel him to pay a debt. In America it is sometimes the custom to serve an attachment on a person's property before trial of the merits of the case. This the sheriff does in order to have security for the payment of judgment should it be recovered. A "foreign" attachment is one where a creditor attaches property which has been put in the hands of an agent by the owner. Foreign attachment is known in the Eastern States as "trustee process." It has been a common proceeding in England from time immemorial. Writs of attachment are granted where there is suspicion of fraud, or of the illegal disposal or covering up of property. See *Britannica*, Vol. III, p. 51.

ATTACK, in military warfare, an advance upon the enemy with a view of driving him from his position. It may either be an attack in the open field, or an attack upon a fortress. Another mode combines an attack on one flank as well as in front by two separate corps, so as either to get in the enemy's rear, or to perplex him as to his retreat.

ATTAINDER is the legal consequence of judgment of death or outlawry, in respect of treason or felony. See *Britannica*, Vol. III, p. 52.

ATTALEA, a genus of palms comprising a number of species, natives of the tropical parts of South America. The fruit is a dry, fibrous husk, inclosing a nut with three cells and three seeds. The leaves of some species are much used for thatching, some are woven into hats, mats, etc. The nuts of some are burned, to dry India-rubber, which acquires its black color from their smoke. The fruit is as large as ostrich eggs, and supplies a kind of vegetable ivory, used for making umbrella handles, etc. The trees are stately and beautiful.

ATTALUS, FLAVIUS PRISCUS, Arian emperor of Rome, proclaimed such by Alarie, A. D. 409; deposed by him in 410, and banished by Honorius, 416.

ATTALUS, two kings of Pergamos, both allies of the Romans, b. 269, d. 197 B.C.; b. 220, d. 138 B.C.

ATTAMAN, or HETMAN, an order of Cossack chiefs of which the heir-apparent to the crown is principal.

ATTEMPT to commit a felony or criminal offense is in many instances equally cognizable by the criminal tribunals with the completed crime itself.

ATTESTATION, in conveyancing, the verification of the execution of deeds and wills by witnesses.

ATTLEBOROUGH, a market town of great antiquity in Norfolk, England, 16 miles southwest of Norwich by rail. It has a college of the Holy Cross (1387); and its cruciform parish church contains some interesting monuments. Population, 2,244.

ATTLEBROUGH, a town of Bristol county, Massachusetts, 31 miles southwest of Boston by rail. It has manufactories of jewelry, buttons, braid, etc.

ATTORNEY, in its general meaning, one appointed by another to act for him. In the United States an attorney-at-law is one who stands in the place of another in matters of law. See *Britannica*, Vol. III, p. 62.

ATTORNEY-GENERAL, the title by which, in the United States, England and Ireland, the first ministerial law officer of the government is known. Nearly all of the States of the Union have attorneys-general, whose duties under the State government correspond essentially with those of the U. S. attorney-general under the general government. See *Britannica*, Vol. III, p. 63.

ATTRIBUTE, in the fine arts, a species of symbol, consisting of a secondary figure or object accompanying the principal figure, as the trident of Neptune, the owl of Minerva, and the cap of Liberty.

ATTRIBUTE, in logic, a term used to denote the opposite of substance. The latter is considered to be self-existent, while the former can only be conceived as possessing a dependent existence. Attributes are commonly said to belong to substances. Thus wisdom, holiness, goodness, and truth are termed attributes of God, who is Himself regarded as the substance in which they inhere. In the same way whiteness is called an attribute of snow.

ATTUCKS, CRISPUS, a half-breed Indian, or mulatto, killed in the Boston massacre, March 5, 1770. He was the leader of the mob which attacked the British troops on that occasion. He was a resident of Framingham, and is supposed to have been about fifty years of age at the time of the massacre. A monument was erected to his memory on Boston Common, in the year 1888; but, at the present writing (1891), a serious doubt, founded upon a recent discovery of old documents in Boston, is expressed as to his existence.

ATWATER, LYMAN HOTCHKISS, an American scholar, born in New Haven, Conn., Feb. 20, 1813, died in Princeton, N. J., Feb. 17, 1883. He graduated at Yale in 1831, at the theological seminary in 1834, and was ordained pastor of the Congregational church at Fairfield, Conn., in 1835, remaining there for nineteen years. In 1854 he became professor of mental and moral philosophy in Princeton, and in 1869 was made professor of logic and of moral and political science. He edited the "Princeton Review," and published a *Manual of Elementary Logic* (1876).

AUBERLEN, KARL AUGUST, a prominent German orthodox theologian, born at Fellbach in Württemberg in 1821, died in 1864. He was the author of several works, among them *The Prophet Daniel and the Revelation of John Considered in Their Reciprocal Relations*.

AUBERVILLIERS, a place in the Seine department, about five miles north of Paris, with a fort which is included within the system of fortifications of the capital. Its industries are iron-founding, manufactures of caoutchouc, paper, varnished leather, glass and chemicals. Population, 19,437.

AUBRY DE MONTDIDIER, a French knight who lived in the time of Charles V. and who, tradition says, was assassinated in the forest of Bondy by Richard de Macaire in 1371.

AUBURN, a village of Lee county, Alabama, the seat of the Alabama Agricultural and Mechanical College.

AUBURN, a village of California, the center of a rich quartz-mining and fruit-growing district.

AUBURN, an important city of Maine, on the Androscoggin and Little Androscoggin rivers, which furnish an immense water-power. It is the seat of an extensive cotton and shoe manufacturing industry. Population in 1890, 11,228.

AUBURN, a city of New York, county-seat of Cayuga county. It is handsomely built on both sides of the outlet of Owaseo Lake, which is the source of supply for the Auburn water-works, and

which furnishes a valuable water-power for the extensive manufactories of the city. These include thrashing-machines, reapers, mowers, binders, woolen and cotton fabrics, iron, and the goods made by the inmates of the State prison which is here located, and which is celebrated for its excellent system of discipline. A good quality of limestone is found in this vicinity. Auburn is the seat of Auburn theological seminary. Many of the gardens and residences of the city are remarkable for their beauty.

**AUBUSSON, PIERRE D'**, Grand Master of the Order of St. John of Jerusalem, born in 1423, died at Rhodes in 1503. His early history is imperfectly known; but he is said to have borne arms, when very young, against the Turks in the wars in Hungary, and to have distinguished himself by the zeal and valor he displayed. See *Britannica*, Vol. XXI, p. 174.

**AUCHENIA**, a genus of ruminating quadrupeds, of which the llama and alpaca are the best known.

BROWN LLAMA (*Auchenia llama*).

The genus is exclusively South American. Indeed, the species occur only on the lofty ranges of the Andes. They are nearly allied to the camels, and may be regarded as their representatives in the zoology of America. Its hide makes good leather, and its hair, of woolly nature, is in great request for weaving light wiry stuffs. The color of the animal varies in different individuals, but brown is the general tint; the hair being always longer, thicker, and more frizzly on the body than on the head, neck, and legs. See *Britannica*, Vol. I, p. 597; Vol. XIV, p. 738.

**AUCHINLECK**, a village of Ayrshire, Scotland, 15 miles east of Ayr. The parish contains Auchinleck House (locally called "Place Affleck"), the seat of the Boswell family. Near the mansion, Sir Alexander Boswell, son of Johnson's biographer, established in 1815 the *Auchinleck Press*, for printing rare works, such as the *Romance of Sir Tristram*, the *Disputation Between John Knox and the Abbot of Crossraguel*, etc. Population, 1,528.

**AUCTION**. The character of this convenient mode of offering property for sale is correctly indicated by the name. The Latin word *auctio* means "an increasing or enhancement," and an auction is an arrangement for increasing the price by exciting competition among purchasers. The auction is of Roman origin, and is said to have been first introduced for the purpose of disposing of spoils taken in war. See *Britannica*, Vol. III, p. 68.

**AUCTIONEER**, a person who conducts an auction. The auctioneer is in a certain sense the agent, both of seller and purchaser, and by the fall of his hammer, or by writing the purchaser's name in his book, he binds him to accept the article sold at the price indicated.

**AUCUBA**, a genus of plants, of the natural order *Cornaceæ*. The only known species of this genus is *A. Japonica*, an evergreen shrub, resembling a laurel; it is a native of China and Japan.

**AUDE (ATAX)**, a river in the south of France. It rises in the east Pyrenees, not far from Mont Louis; flows for some time parallel to the canal of Languedoc, and falls into the Mediterranean six miles northeast of Narbonne, after a course of more than 120 miles.

**AUDIFFRET, CHARLES LOUIS GASTON, Marquis d'**, born in Paris, Oct. 10, 1787, died there April 28, 1878. On the completion of his studies, in 1805, he entered the administration of the finances and in 1812 became chief of the bureau and auditor to the council of state. On the return of the Bourbons in 1814, he was made chief of division and chevalier of the Legion of Honor. Appointed director of petitions in 1817, he became councilor of state in 1828, and was made president of the court of accounts in 1829. This last position he held during thirty years, resigning it in 1859 to become president of the administrative council of the Society of Commercial and Industrial Credit. Meantime, under Louis Philippe, he held a seat at the Luxembourg, as a peer, from 1837 to 1848, and was made a senator under the Empire. In 1847 he had been made grand officer of the Legion of Honor, and he received the grand cross in December, 1869. He published several works on finance.

**AUDIFFRET-PASQUIER, EDMÉ ARMAND GASTON, Duc d'**, a prominent French statesman, was born at Paris, Oct. 20, 1823. He was the son of Count d'Audiffret, but being adopted by his grand-uncle, Baron Pasquier, became heir to the title of duke conferred upon the baron in 1844. He became auditor of the council of state in 1845. His liberal opinions prevented his holding any important office under the Empire, but in 1871, after the fall of the Empire, he became prominent as leader of the moderate conservatives in the assembly. He was strongly opposed to the Thiers government, and became one of the leaders of the Right Center. After the fall of that government, in 1874, he was elected vice-president of the National Assembly, and president in 1875. The republican constitution of France was adopted by the assembly during his presidency. In December, 1875, he was elected permanent senator, and in March, 1876, was chosen president of the senate by a nearly unanimous vote. This position he held until 1879.

**AUDIOMETER**, an instrument for measuring the power of hearing and recording it upon an arbitrary scale. It is a special application of the telephone.

**AUDIPHONE**, an instrument invented in 1879 by Mr. Rhodes, of Chicago, to assist the hearing of deaf persons in whom the auditory nerve is not entirely destroyed. It consists of a diaphragm, or plate, which the person using it presses against the upper front teeth with the convex side outwards; when so placed it communicates the vibrations caused by sound to the teeth and the bones of the skull, and thence to the organs of hearing.

**AUDITA QUERELA**, a form of action which lies for a defendant to recall or prevent an execution, who has grounds to show that such execution ought not to issue against him, or on account of some matter occurring after judgment amounting to a discharge, which could not have been and cannot be taken advantage of otherwise. It is a remedial process, equitable in its nature, based upon facts, and not upon the erroneous judgment or acts of the court, in which damages may be recovered if execution was improperly issued. In some States it has been entirely superseded by relief granted upon motion, while in others it is recognized by statute and of frequent use. The writ of *audita querela* does not lie against the government.

**AUDITOR**, the name given to certain officers appointed to examine accounts on behalf either of the government, of courts of law, of corporations, or of private persons. See *Britannica*, Vol. III, p. 69.

**AUDLEY, SIR JAMES**, one of the original knights of the Order of the Garter. He was frequently in

personal attendance on Edward the Black Prince, whom he accompanied to France in 1346, and subsequently to Spain. He died in 1369.

AUDLEY, THOMAS (1488-1544), Lord Chancellor of England in the time of Henry VIII. He presided when Sir Thomas More was tried.

AUENBRUGGER, or AVENBRUGGER, LEOPOLD. See Britannica, Vol. III, p. 145.

AUER, ALOIS (1812-1869), native of Upper Austria, and trained in a printing establishment. During his leisure moments he employed himself in acquiring a knowledge of French, Italian, English and other languages. In 1864 he published his discovery in photography of "spontaneous impression."

AUERBACH, BERNHOLD, a popular German author, born at Nordstetten, in 1812, died in 1882. Having abandoned the study of Jewish theology, he devoted his attention to literature. Many of his works have been translated into English, Swedish and Dutch. *Das Landhaus am Rhein* is known by the English title, *The Castle on the Rhine*.

AUERBACH, HEINRICH, a friend of Luther and a medical professor in Germany. He died in 1542.

AUERSPERG, CARLOS, prince, president of the Reichstadt, and of the Bohemian Diet. Born 1814.

AUERSTÄDT, a village in the Prussian province of Saxony, ten miles west of Naumburg. It is famous for the great battle which took place there Oct. 14, 1806, between the French under Davoust and the Prussian army under Duke Charles, of Brunswick, which resulted in a great victory for the former. The Prussians, who numbered fully 48,000, left nearly half their men, dead or wounded, on the ground, while the French (30,000) escaped with a loss of only 7,000. Napoleon, who had on the same day defeated the main army of Frederick-William III at Jena, made Davoust duke of Auersstädt.

AUFRECHT, THEODOR, philologist, born at Leschnitz, in Upper Silesia, Jan. 7, 1822. After studying at Berlin under Bopp, Böckh and Lachmann, he settled there in 1850, and devoted himself to Sanskrit and the old German tongues. To this time of his life also belongs his collaboration with Kirchhoff in the publication of *Unbrüche Sprachdenkmäler* (two vols. Berlin, 1849-51)—an epoch-making work in the comparative study of the languages of ancient Italy—as well as the founding of the well-known *Zeitschrift für Vergleichende Sprachforschung* (1852), in the editing of which he assisted A. Kuhn for some time. In 1852 he went to Oxford, where he helped Max Müller in his edition of the *Rigveda*, and was appointed to a place in the Bodleian Library, the fruit of which was his excellent *Catalogus codicum Sanscritorum bibliothecae Bodleianae Orientalis* (1864). In 1862 he became professor of Sanskrit and Comparative Philology at Edinburgh, and in 1875 resigned this chair for one at Bonn. Aufrecht has published scholarly editions of several classical Sanskrit works, most important being his *Rigveda*, in the Roman character (2d edition, 2 vols. Bonn, 1877).

AUGER, an instrument used by carpenters for boring holes, chiefly in wood.

AUGIER, GUILLAUME VICTOR EMILE, a French dramatist of considerable reputation, born at Valence in 1820. His comedy, *Gabrielle*, gained at the French Academy the Montyon prize in 1849, and in 1857 he was admitted a member of the Academy.

AUGITE, or PYROXENE, a mineral very nearly allied to hornblende. It is little affected by acids or not at all; it is usually of a greenish color, very often black. It crystallizes in six or eight-sided prisms, variously modified. It is an essential component of many igneous rocks, particularly of ba-

salt and augite-porphry, from which chiefly it derives its importance as a mineral species.

AUGMENTATION, in music, the reproduction of a melody, or principal subject of a composition, in the course of the progress of the piece, in notes of greater length than those in which the melody is first introduced.

AUGMENTATION, PROCESS OF: in Scotch law, is an action in the Court of Teinds by the minister of a parish against the titular, or beneficiary, and heritors, for the purpose of procuring an increase to his stipend. The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. In the time of George III it was enacted that no augmentation should be granted till the expiration of 15 years from any augmentation previous to the act, nor till the expiration of 20 years from any augmentation subsequent to the act. A period of 20 years must thus elapse between each augmentation.

AUGUR, CHRISTOPHER COLON, American soldier, born in New York in 1821. He graduated at West Point in 1843, and served during the Mexican war as aid-de-camp to Gen. Hopping, and later to Gen. Caleb Cushing. He served as captain against the Indians in Oregon in 1856, and in 1861 was appointed major in the 13th infantry. The same year he became a brigadier-general of volunteers, and was severely wounded in July, 1862, during the battle of Cedar Mountain. Subsequently he fought with distinction in various important battles, and was retired in 1885 as major-general.

ARARAT (see Britannica, Vol. II, p. 309), a mountain in Armenia (about 17,112 feet above the sea-level), on which Noah's ark is supposed to have rested, B. C. 2349, now termed by the Persians, Koh-i-Nuh (Noah's mountain); by the Armenians, Masis; by the Turks, Agri-Dagh. The mountain was ascended by Dr. Parrot, Sept. 27, 1829; by Major Stuart, 1856, and by others since. Mr. James Brice, who ascended Sept. 11, 12, 1876, described the summit as a little plain of snow, silent and desolate, with a bright, green sky above;—the view stern, green and monotonous. In August, 1888, it was ascended by Professor Mackoff and M. Popoff, both native Russians.

AUGUSTA, a trading town of Arkansas, county-seat of Woodruff county, situated on the east bank of the White River. It deals chiefly in cotton, which is here shipped by steamboat, and is the seat of a good high school.

AUGUSTA, an important commercial and manufacturing city of Georgia, county-seat of Richmond county. It is beautifully situated upon the west bank of the Savannah River, at the head of steamboat navigation. It is the second oldest city in the State. It was settled by colonists under General Oglethorpe; laid out under royal charter in 1735; rechartered in 1798, and incorporated as a city in 1817. During the Revolutionary war Augusta was captured and held for two years by the British, until June 5, 1781, after a siege of thirteen days, it was surrendered to the Americans under General Henry Lee. The war of 1812 and the Indian wars left the recuperated and prosperous city unmolested; but during the civil war it was twice threatened by General Sherman, and was garrisoned by the Confederates. Augusta is well built; its streets are straight and wide, and cross each other at right angles. The Medical College of Georgia, founded in 1830, is located here. The Richmond Academy is an incorporated institution, and there are numerous flourishing graded schools. Among the notable public buildings, monuments and institutions are also a handsome and costly City-hall, the Odd Fellows' and Masonic halls, the opera house, Inde-

pendence monument, Confederate monument, Augusta Orphan Asylum, and numerous other charitable institutions. The Augusta Canal, 9 miles long and 150 feet wide, and fed by means of an immense stone dam which here crosses the river, furnishes an abundance of the purest water for domestic use and for the numerous manufactories of the city. These represent a capital of some nine million dollars, of which about five million is invested in the cotton trade. Population, in 1860, 12,493; in 1870, 15,389; in 1880, 21,891; in 1890, 33,150. See *Britannica*, Vol. III, p. 73.

AUGUSTA, a city of Maine, capital of the State and county-seat of Kennebec county, is pleasantly situated at the head of tidal navigation on both sides of the Kennebec River, which is spanned by an elegant bridge uniting the two parts of the city. Since the destructive fire of 1865, the business quarter of the city has been conveniently and handsomely rebuilt. There is an abundant supply of water, which is utilized by a fine system of waterworks, and in the extensive manufacture of lumber and cotton goods. The State-house, situated on an eminence at the southern limit of the city, is a handsome structure of whitish granite. The United States Arsenal and Military Asylum, and the State and City libraries, are of special interest. Augusta is the seat of St. Catherine's school for young ladies. Population, in 1890, 10,521. See *Britannica*, Vol. III, p. 73.

AUGUSTANA COLLEGE AND THEOLOGICAL SEMINARY, incorporated at Paxton, Ill., in 1865. Its object is to educate candidates for the ministry of the Evangelical Lutheran Church, and also young men for teachers. The Faculty consists of a president, three professors and tutor.

AUGUSTULUS, ROMULUS, the last emperor of the western portion of the Roman empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of his littleness of character. He was the son of Orestes, a Pannonian of birth and wealth, who rose to high rank under the Emperor Julius Nepos. On the flight of the emperor Orestes conferred the vacant throne on his son Augustulus, A. D., 476, retaining all substantial power in his own hands. Orestes, failing to conciliate the barbarians, who had helped him against Nepos, they besieged him in Pavia, and, capturing him, put him to death. Augustulus was dismissed to a villa near Naples, with an annual pension of 6,000 pieces of gold. His after fate is unknown.

AUK (*Alca*), a genus of web-footed birds, the type of the family *Alcidae*, which was in great part included in the Linnæan genus *Alca*, and to many of the species of which, now ranked in other genera, the name auk is still popularly extended. The *Alcidae* are among those web-footed birds collectively called *Brachypteres* (i. e., short-winged), or Divers, by Cuvier. They are remarkable for the shortness of their wings, which they employ as fins or paddles for swimming under water, some being even incapable of flying; and for the position of their legs, further backward than in other birds, which makes walking difficult, and when they are on

AUK.

land compensate them to maintain an upright position. They are distinguished by the very compressed bill which in the true auk is vertically elevated, and so sharp along the ridge as to resemble the blade of a

knife, and by their entirely palmated feet, destitute of hind toes. The auks are confined to the seas of the northern hemisphere, and are most abundant in the colder regions. They all have a dense plumage, which exhibits on its surface a beautifully polished silvery luster. See *Britannica*, Vol. III, pp. 85, 734, 735; Vol. X, p. 78; Vol. XX, p. 302.

AULA REGIA, an English court established by William the Conqueror, and regulated afterward by the Magna Charta.

AULAPOLAI, or ALLEPPI, a seaport, with a light-house, in Travancore state, Madras, 33 miles south of Cochin. Communication is maintained with Quilon and Trivandrum on the south, and with Cochin on the north, by canals parallel with the seacoast, and connecting a series of lakes or backwaters. Between these and the sea is a wide creek, through which is floated the timber for exportation, which is brought from the forests of the Maharajah of Travancore on the western Ghauts. There is considerable trade in coffee, coir, pepper, and cardamoms. Population, 30,000.

AUMALE, CHARLES DE LORRAINE, DUC D' (1554-1631), an ardent partisan of the League in the politico-religious wars which devastated France in the 16th century.

AUMALE, CLAUDE II, DUC D', born in 1523, killed by a cannon ball before La Rochelle in 1573. He was one of the chief instigators of the St. Bartholomew massacre in 1572.

AUMALE, HENRI EUGENE PHILIPPE LOUIS D' ORLEANS, DUC D', born at Paris in 1822, the fourth son of King Louis Philippe. In 1847 he succeeded Marshal Bugeand as governor-general of Algeria. He resigned in 1848, and, joining his father, resided in England till the law was repealed banishing the Orleans princes from France, and became known by his literary work. In 1871 he was elected a member of the National Assembly and returned to France. He was president of the court-martial which tried Marshal Bazaine. In 1885 the expulsion bill was passed, and again he was an exile till it was revoked in 1889.

AUNE, the French cloth-measure corresponding to the English *ell*. The English *ell*=1¼ yard=45 inches; the French *aune usuelle* (or *nouvelle*)=1½ meter=47½ inches English.

AUNOY, MARIE CATHERINE JUELLE DE BERNEVILLE COMTESSE D' (1650-1705), a celebrated French authoress of the reign of Louis XIV. She composed fairy tales, romances, and historical memoirs.

AURANTIACEÆ, a natural order of oxogonous plants, consisting of trees and shrubs, often of great beauty. The species of the genus *Citrus* are best known, among which are the orange, lemon, citron, etc.

AURELIANUS (*Aurelian*), LUCIUS DOMITIUS, one of the most powerful of the Roman Emperors. On the death of Claudius II (A. D. 270), Aurelianus was elected emperor by the army. He commenced his reign by vigorous opposition to the barbarian, Alemanni, or Marcomanni, whom he expelled. His most famous enterprise was an expedition against Zenobia, whom he defeated and captured. He fell a victim to conspiracy, and was assassinated by his secretary, A. D. 276.

AUREUS, or DENARIUS AUREUS, a Roman gold coin, first coined 207 B. C. See *Britannica*, Vol. XVII, p. 653.

AURICULA (*Primula auricula*), a plant of the same genus with the primrose, much cultivated in flower gardens, has smooth, dark green leaves, leafless stems, and calices covered with a mealy powder. A similar powder appears also on the flowers, which adds much to their beauty. This plant is a native of the Alps and of other mountains in the

south and middle of Europe, and of sub-Alpine situations in the same countries. The name *Auricula* is derived from the Latin word *auris*, an ear, on account of the resemblance of the leaves to the ears of an animal. See *Britannica*, Vol. XII, p. 253; Vol. XIX, p. 737.

**AURICULA**, a genus, and *Auriculida*, a family, of gastropod mollusca. They belong to the same order as the common snails, having organs for breathing in air, although some of them can exist for a considerable length of time under water. Some of them live in fresh-water marshes, while others prefer the vicinity of salt water. Some of them attain a large size. *Auricula Midy* is found in the East Indies, and is known to shell collectors by the name of Midas Ear. See *Britannica*, Vol. XXII, p. 187.

**AURICULATE**, in botany, a term applied to leaves, stipules, etc., and signifying that they have at the base two small, ear-like lobes.

**AURIGA**, a constellation containing Capella, a star of the first magnitude.

**AURIOL**, a town near Marseilles, in France. Population, 5,182.

**AUROCHS** is properly the German name of the extinct species of wild ox, called by *Cæsar* *Urus*, a few herds of which are still found in Lithuania. Recently the name has been erroneously used for the American bison. See *Britannica*, Vol. III, p. 792.

AUROCHS.

**AURORA**, one of the largest cities of Illinois, beautifully situated on the Fox River, in the fertile southeastern part of Kane county. It has an extensive trade in the staple products of the surrounding country, and a variety of manufactures, including machinery, flour, woolen goods, silverware, carriages, sash and blinds. It is an important railroad center, and contains the shops of the Chicago, Burlington & Quincy R. R., which employ nearly two thousand men. Among the notable buildings are that of the Young Men's Christian Association, and a fine city-hall, which cost \$75,000. Aurora is the seat of Jennings' Seminary, and its public schools are excellent. Population in 1890, 19,634.

**AURORA**, a city of Dearborn county, Indiana, on the Ohio River, and on the Ohio & Mississippi R. R. Population in 1890, 3,929.

**AURORA**, a village in New York, seat of Wells' Ladies' College and Cayuga Lake Academy.

**AUSABLE**, a village of New York, on the Ausable River.

**AUSSEE**, a market-town in the Salzkammergut of Styria, situated at the confluence of three mountain streams, which form the Traun, 22 miles southeast of Ischl. It has mineral springs and baths, and is visited by some 6,000 strangers annually. Population, 1,369.

**AUSTEN**, WILLIAM, an Englishman of the 15th century, celebrated as a metal-worker and designer. He constructed the famous tomb of Richard de Beauchamp, Earl of Warwick, in St. Mary's Church, Warwickshire. See *Britannica*, Vol. XXI, p. 559.

**AUSTIN**, ALFRED, journalist and poet, born at Headingly, near Leeds, May 30, 1835. He was educated at Stonyhurst and St. Mary's College, Oscott. He graduated at the University of London in 1853, and was called to the bar in 1857. He became interested in literature, and soon devoted himself en-

tirely to that pursuit. His first important book was *The Season: a Satire* (1861), which was severely criticised. *The Human Tragedy* (1862) was soon recalled, and was not issued in altered form until 1876. Among later volumes of verse are *Saronarolo*, a tragedy (1881); *Soliloquies in Song* (1882); and *At the Gates of the Convent* (1885). As a journalist Austin has long been connected with the "Standard" and "Quarterly Review," and has acted since 1883 as editor of the "National Review."

**AUSTIN**, MOSES, a Texan pioneer, born in Durham, Conn. He went to the West in 1798, and engaged in lead mining. In 1820 he removed to Texas, and petitioned the Mexican commandant at Monterey for permission to colonize 300 families in that section. While in search of emigrants he was robbed and the hardships he encountered caused his death, in Louisiana, June 10, 1821.

**AUSTIN**, STEPHEN F. (c. 1790-1836), a Texan pioneer, born about 1790. He founded the present Austin, Texas, after obtaining a confirmation of the grant to colonize 300 families, obtained by his father from the Mexican authorities in 1820. In 1833 the American settlers had become powerful and were restless under Mexican rule, Austin going so far that he was imprisoned for several months. On his liberation in 1835 he took part with the revolutionists. He became commander-in-chief, and in November was sent on a commission to the United States to secure recognition from the government at Washington. In this capacity he acted with prudence, and would have obtained recognition of Texan independence had he been properly provided with credentials. He returned to prosecute his work, but died Dec. 27, 1836.

**AUSTIN**, a city of Minnesota, county-seat of Mower county, pleasantly situated on Red Cedar River. It has a thriving trade in general merchandise, and is actively engaged in the manufacture of farming tools, barrels, pressed brick, flour, ploughs and machinery, and contains a number of foundries, machine shops, marble works, a creamery, a canning and preserving factory, and railroad shops. Other points of interest are a fine opera house, the court-house and the board of trade.

**AUSTIN**, a city of Nevada, county-seat of Lander county. It is situated in a rich mining region, surrounded by mountains and deep cañons, on the eastern slope of the Toiyabe range. The chief industry is the mining of silver, and there are also several quartz mills and a reduction works, a machine shop and a foundry.

**AUSTIN**, a city of Texas, capital of the State, and county-seat of Travis county, finely situated in the midst of beautiful scenery, at the head of high-water navigation on the left bank of the Colorado River, which here breaks through a range of hills upon which the city is built, and which is spanned by two fine bridges. The most prominent feature of this lovely city is the new capitol, built of Texas marble, for the cost of which three million acres of State land was appropriated, and which occupies a central position on Capitol Hill. From this the principal avenues, 120 feet wide, radiate north, south, east and west, crossed by shaded streets, most of which are 80 feet in width. Austin is an important railroad city, and the trade center of a fertile agricultural and grazing district, the staple products of which are cotton, corn, sweet potatoes, pork and cattle. It is the seat of the State University, Texas Military Institute, a Roman Catholic Academy, and asylums for the blind, the insane and the deaf. Population in 1890, 15,324.

**AUSTRALASIA**, a term usually including the Australian colonies, together with Tasmania, New Zealand, Fiji, Tasmania, New Guinea, New Britain,

New Ireland, Solomon's Islands, New Caledonia, and New Hebrides, which see severally in these volumes.

**AUSTRALIA.** Area, 3,031,169 sq. miles. Population, 2,819,367. British Colonial possessions, consisting of five provinces, viz: Queensland, capital Brisbane; New South Wales, capital Sydney; Victoria, capital Melbourne; South Australia (including Northern Territory), capital Adelaide, and Western Australia, capital Perth. For general history and descriptive features, see *Britannica*, Vol. II, pp. 103-15. Australia is the largest island in the world: extreme length, from east to west, 2,400 miles; from north to south, 1,971 miles. For latest events and statistics, see the several provinces in these Revisions and Additions.

**AUSTRALASIAN CONFEDERATION.** a subject receiving large attention in the Australian colonies for several years. In 1885 a Federal Council Act was formulated for the purpose of dealing with matters of common interest, but the federal union was only partially effected. A council was instituted, and sessions were held in 1886, 1888 and 1889, but the colonies of New South Wales and New Zealand had not thus far sent a representative. The council did not meet in 1890, but, instead, a conference of representatives of the Australasian Colonies met in Melbourne, Feb. 6, 1890, for the purpose of considering a scheme of Australasian Federation and Federal Defense. The colonies represented were Victoria, New South Wales, South Australia, Queensland, New Zealand, Tasmania, and Western Australia. A resolution was adopted declaring that the time had come for the union of the Australasian Colonies under one government. Provision was made for the admission into the Union of the more remote Australasian Colonies, at such times and under such conditions as might thereafter be agreed upon. The Conference sat till Feb. 14th, and before adjourning adopted an address to Her Majesty, the Queen of England, embodying the resolutions passed, one of which provided for holding a National Australasian Convention early in 1891 to be composed of delegates appointed by the legislatures of the various Australasian colonies. A cablegram from Melbourne, Nov. 21, 1890, announced that the Convention would be held in Sydney in March, 1891.

**AUSTRASIA**, or the East Kingdom, including Lorraine, Belgium, and the right bank of the Rhine, having their central point at Metz. It is the name given under the Merovingians to the eastern possessions of the Franks. Under Charlemagne's successors Austrasia became a part of Germany.

**AUSTRIA-HUNGARY.** Area, 261,649 sq. miles. Population (1888), 41,665,277. To this should be added military population, 162,423, making a total of 41,827,700. Capital of the Empire, Vienna. Reigning Emperor, Francis Joseph, Emperor of Austria and King of Bohemia, etc., and Apostolic King of Hungary.

Austria proper, 115,914 sq. miles; population, 23,485,000. Hungary, 124,448 sq. miles; population, (1888), 16,670,115. Bosnia and Herzegovina, 20,177 sq. miles; population, 1,336,091. Among this population there were in 1880 about 18,920,000 Slavs, 9,977,000 Germans, 6,489,000 Magyars, and 2,614,000 Roumanians. According to religion, there are nearly 29,111,000 Roman Catholics, 3,611,000 Protestants, 3,512,000 Greeks and Armenians, 1,652,000 Jews, and 193,000 Mohammedans. The Empire—the official denomination of which is now *Oesterreichisch-Ungarische Monarchie* (the Austro-Hungarian Monarchy)—is divided into the Austrian state and the Hungarian state, each having its own parliament, ministry and administration. Capital of Hungary, Buda-Pesth.

The lands of the Austrian crown are Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Carniola, Coast-Districts (Görz, Gradisca—Trieste, and Istria), the Tyrol and Vorarlberg, Bohemia, Moravia, Silesia, Galicia, Bukovina, and Dalmatia. The lands of the Hungarian crown embrace Hungary, Transylvania, Fiume, Croatia, and Slavonia. The soil produces grain of all kinds, potatoes, beet-root and wine. Austria ranks next to France, Italy, and Spain as a wine-growing country (Austria, 1888: 91,404,720 gallons, and 109,144,134 in Hungary, 1887); but, from its inland position and other causes, the wines are not so well known in this country as they deserve to be: 1,050,000 tons of beet-sugar were manufactured in 1887-88. Industry is almost wholly confined to the western half of the monarchy, and more especially to Vienna, Bohemia, Moravia, and Silesia. Styria is the great center of the iron trade; Brunn is famed for its woollens, Reichenberg for woollens and cottons, Trautenu for linen, Bohemia for glass, and Vienna and Pilsen for lager beer. The mineral riches are very great, comprising gold, silver, copper, iron, quicksilver, lead, tin, zinc, coal (Austria, 1888: 42,269,432; Hungary, 1887: 5,019,695 tons; petroleum is also found in Galicia).

The Empire possesses a powerful army, amounting, on the peace footing, to 273,779 men with 19,733 officers; and the war establishment, including a Landwehr of 349,284 men, etc., consists of 1,177,644 officers and men, with 2,008 field guns. Military service is compulsory on all. The navy consists of 157 vessels, of which 12 are iron-clads, 6 torpedo vessels, and 57 torpedo boats. Pola is the great naval arsenal. The imports amounted (1888) to £44,420,000; the exports (1888), £60,450,000; they included vegetable fibers and manufactures; silk and silk goods; vegetables, fruits, etc.; fats and oils; grain and pulse; colonial wares; clothing, haberdashery; animals; machinery and carriages; wool and woolen goods; furs and skins, wooden ware, etc. The raw materials were roughly valued at £25,425,000, and the manufactured goods at £21,208,333 (1886). About one-half of the exports consisted of agricultural produce. Some of the principal articles were grain, pulse, and flour, £5,868,823; fuel, £3,756,647; sugar, £1,978,772.

Although the term Austria-Hungary is occasionally used, Hungary itself as a state is seldom thought of. Austria alone is mentioned as covering the whole monarchy. Actually Hungary is not only a distinct kingdom, but it has in almost every sense a distinct and separate existence. The Emperor of Austria is also separately crowned as King of Hungary. The following particulars will therefore be of interest to many persons to whom the subject of the distinct and separate Kingdom of Hungary will be novel.

Hungary, with its dependent states, has an area of 322,302 sq. kilometres, about 124,448 sq. miles—that is, rather larger than the United Kingdom, with a population of 16,979,813 in December, 1887. To this Fiume contributes 22,364, and Croatia and Slavonia 2,098,161. The country is divided into 72 counties, with 473 districts for those of Hungary. Hungarian is the official language, except in Croatia and Slavonia, where Croatian is spoken. Croatia and Slavonia are annexes of the crown of Hungary, but both countries have an autonomy for home affairs, law and public instruction. At the head of the Croatian government is the *Ban* Khuen Héderváry, who is responsible to both the Diet of Croatia and to the Hungarian prime minister. All other matters are in common, the Croatian Diet sending 40 members to the Hungarian parliament, while the Hungarian ministry contains a Croatian member.

The Hungarian parliament consists of 458 members, elected for five years. Of these Croatia sends 40, but they are not entitled to vote on matters connected with Hungarian laws, education, and home affairs. There is also an Upper House consisting of wealthy magnates, gentlemen who contribute more than 3,000 florins to the land tax, the prelates, the *Ban*s, and three members of Croatia sent by the Diet, and fifty members nominated by the crown. Of the inhabitants there were 6,499,107 native Magyars at the census of 1880, but a large portion of the other nationalities speak the national tongue. Those who do not are generally the uneducated, chiefly Roumanians in Transylvania, who are there nearly as numerous as the Hungarians, the Székelys, "the most excellent Hungarian race," and the Saxons of Transylvania. In addition to Buda-Pest there are thirty-three other cities, each containing more than 20,000 inhabitants.

Hungary excels in its agriculture. All the great plains produce vast quantities of grain. In many parts wheat grows upon land that is seldom or never manured. The returns for 1889 (excluding Croatia and Slavonia) give 32,958,777 hectolitres of wheat, 12,965,531 of rye, 12,163,502 of barley, 15,378,523 of oats, and 36,082,982 of Indian corn. The cattle number 4,879,038, sheep 10,594,831, horses 1,748,859, and swine 4,803,639. Hungary is not a manufacturing country.

AUTEUIL, a village at the entrance of the Bois de Boulogne containing 6,000 inhabitants. It was the home of Molière (whom Andrieux introduced in his *Molière avec ses Amis, ou le Souper à Auteuil*, Boileau, and the gifted widow of Helvetius, whose parties Bonaparte often attended in 1798 and 1799).

AUTHENTIC, a term applied to writings or documents whose contents may be depended upon for truth and accuracy. It is sometimes used as synonymous with *genuine*, though a distinction has been drawn between the two words, especially by biblical critics.

AUTHORITY, that to which appeal may legally be made in science, law or theology; the right to demand obedience.

AUTOBIOGRAPHY, the history written by one's self of one's own life, or a sketch of contemporaneous events.

AUTOCRACY, a form of government in which the sovereign controls the legislative and executive powers of the state and rules alone. He is called an autocrat. Most eastern governments are of this form. The Emperor of Russia is the only European ruler who bears the title of autocrat.

AUTOGRAVURE, a peculiar process of photo-engraving, patented by J. R. Sawyer, London, Nov. 12, 1884. If an ordinary autotype carbon print be placed on silvered copper instead of on paper, the slight relief which the picture possesses is enough to admit of an electrotpe being taken from it. The raised part of the print becomes the depressed part in the electrotpe, and impressions can therefore be taken from the latter in the same way as from an engraved copper plate.

AUTONOMY (Gr., *self-legislation*), the management of the government by the citizens of a state; applied especially to the political conditions of ancient Greece.

AUTOPLASTY, a mode of surgical treatment which consists in replacing a diseased part by means of healthy tissue from other parts of the same body. The most familiar instance is the rhinoplasty or taliaecotian operation for supplying a new nose from the skin of the forehead.

AUTOPTSY, eye-witnessing, a direct observation; but generally used of a post-mortem examination, or dissection of the dead body.

AUTOTYPE. A sheet of paper coated with a film of bichromatized gelatine, in which lampblack or other permanent pigment has been held in solution or suspension is exposed to the action of light in a printing frame, beneath an ordinary photograph negative. In proportion as the light is admitted to the gelatine film or "tissue" through the negative, it becomes hardened and insoluble in water. The print is afterwards treated by washing away the unaltered portions of the film, and the result is a permanent print of the object photographed. The autotype process is admirably adapted for the reproduction of oil-paintings, and has been successfully employed for the reproduction of drawings; but where the work to be copied has a perfectly dead surface the slight gloss possessed by the autotype print is a disadvantage. This objection is still greater in the reproduction of engravings and etchings; and for these the heliogravure process of Mr. Amand Durand, of Paris, is preferable.

AUTUMN, the third season of the year, between summer and winter. Astronomically, in the northern hemisphere, it begins at the autumnal equinox, when the sun enters Libra, Sept. 22d, and ends at the winter solstice, when the sun enters Capricorn, Dec. 21st; but popularly in North America, the months of September, October and November. In Great Britain it comprises August, September and October; while, according to Littré, it extends in France from the end of August to the first fortnight of November. In the southern hemisphere it corresponds in time to the northern spring.

AVA, ARVA, YAVA, or KAVA (*Macropiper nuthyticum*), a plant of the natural order *Piperaceæ*, having narcotic properties. Until recently it was ranked in the genus *Piper* (pepper). It is found in many of the South Sea Islands, where the people intoxicate themselves with a liquor produced from its root. A tincture of it is used beneficially in chronic rheumatism. The intoxicating liquor is prepared by macerating it in water.

AVADUTAS, Hindu Bramins, who prove their superior sanctity by distorting their muscles and limbs and subsist on alms.

AVALANCHES, masses of snow or ice that roll down the sides of high mountains. They have different names according to their nature. Drift or powder avalanches (*Staub Lawine*) consist of loose, dry snow, which, once set in motion by the wind, accumulates in its descent and finally comes into the valleys in overwhelming dust-clouds. Another kind of avalanche resembles a land-slide. In the spring, when the snow begins to melt, the sod underneath becomes detached and the snow and sod go down the mountain carrying all before them. The greatest danger is from avalanches passing over precipices or precipitous walls of rock. The very wind they create often prostrates forests and houses. Ice avalanches consist of masses of ice that detach themselves from the glaciers in the upper regions and are heard in summer thundering down the mountains. They are most common in July, August and September.

AVALON, the earthly paradise of Celtic mythology, a "green island" far to the westward, where the sun-god seems to sink to his rest. It was the land of the mystic fountain, the apples (*avlan*) with their strange, magical properties, and the mighty smith who forged "Duré Entaille" for Arthur. The name was applied in the chivalrous poetry of the middle ages to the region where the fairy Morgana holds her court, and afterwards by rationalizing historians to the Isle of Saints, Glastonbury, on the river Brue, in Somersetshire—famous in romantic British history as an abode of Druids and

the place to which Arthur was carried to be healed of his wounds.

**AVALON**, a peninsula forming the eastern part of Newfoundland, on which St. John's, the capital, is situated. See *Britannica*, Vol. XVII, p. 382.

**AVARI**, an eastern tribe who made their appearance 100 years later than the Bulgarians, in the countries about the Caspian Sea and rivers Don and Volga. About A. D. 555, one part of them passed on to the Danube and settled in Dacia, the others remaining at Caucasus. Those at Dacia served in Justinian's army and assisted the Lombards in overthrowing the kingdom of the Gepidæ; and, about the end of the sixth century, under the mighty Khan Bajan, they conquered Pannonia, and are now confounded with the Bulgarians.

**AVAST**, a term used on shipboard. It is a command to stop or cease any operation going forward.

**AVATAR** primarily signifies, in Sanscrit, a descent, but is particularly applied to a Hindu deity who descends upon the earth in a manifest shape, either for good or for retributive ends. It is thus almost synonymous in its signification with the Christian term *incarnation*. The word is sometimes rhetorically employed in English literature. The avatars of Vishnu are the most famous in Hindu mythology.

**AVELLANEDA**, GERTRUDIS GOMES DE, a Spanish poetess, novelist and author of successful plays, born in Cuba in 1816, died in Seville in 1864.

**AVE MARIA**, also **ANGELICA SALUTATIO**, or the angelic salutation, are names given to a common form of address to the Virgin Mary by the Roman Catholics. *Ave Maria* are the first two words of the prayer, in Latin, which is taken from the angel Gabriel's salutation (Luke i, 28). An edict of Pope John XXII (1326) ordains that every Catholic, morning, noon and night, at the warning of the bells, shall repeat three aves.

**AVENS**, the popular name of *Geum*, a genus of *Rosaceæ*, of which two species, *Geum urbanum*, the common avens, and *Geum rivale*, or water avens, found throughout the temperate regions, were formerly used in pharmacy, called clove-root and herb bennet (*Herba benedicta*) in old herbals.

**AVENTURINE**, a vitreous variety of quartz, generally translucent, and of a gray, green, yellow, red or brown color. It contains numerous minute spangles, generally of mica, but sometimes, according to some authorities, they are scales of metallic copper. It is found in Silesia, Bohemia, France, Spain and India, but chiefly in the Ural Mountains, near Ekaterinburg. It is used in jewelry, but is not so much valued as the finer kinds of amethyst or cairngorm stone.

**AVENTURINE GLASS**, or **GOLD STONE**, is produced by fusing glass and copper filings together. It presents a rich, brown ground filled with gold specks. See *Britannica*, Vol. XVII, p. 48.

**AVERELL**, WILLIAM WOODS, American soldier, born in Cameron, Steuben county, N. Y., Nov. 5, 1832. He graduated at West Point in 1855, and was assigned to the mounted riflemen. He served against the Kiowa and Navajo Indians and was severely wounded during a night attack in 1859, and was on sick leave until the outbreak of the civil war. He then became lieutenant of the mounted riflemen and was on staff duty near Washington, taking part in several engagements, among them the battle of Bull Run, until Aug. 23, 1861, when he was promoted to colonel of the Third Pennsylvania cavalry. He was on duty almost continuously until he resigned on May 18, 1865, after he had been brevetted the different grades of his regular army rank until he was brevet major-general. In 1869 he became president of a large

manufacturing company, after serving three years as consul-general of the United States in the British provinces of North America. He has since made numerous important inventions.

**AVERY**, WAITSTILL, first attorney-general of Connecticut (1777), and an influential patriot of Revolutionary times, born at Groton in 1745, died in 1821.

**AVERYSBOROUGH**, a village of North Carolina, situated on Cape Fear River. It is noted as the scene of a battle, fought March 16, 1865, in which the Confederates, under General Hardee, were defeated by the Union troops under General Sherman.

**AVERAGE**, in maritime law, a rule was established by the Rhodian law, and has prevailed in every maritime nation, that where a loss has been sustained, or expense incurred for the general safety of the ship and cargo, a contribution should be made in proportion to their respective interests, by the owners of the ship, freight and goods on board; or, in modern times, by the insurers of these. To this contribution the name of *general average* is given. To the loss of an anchor, the starting of a plank, or any accident not involving the common safety, *particular average* applies. See *Britannica*, Vol. III, p. 145.

**AVEZZANA**, GIUSEPPE, a commander of the Roman army in 1849. He escaped to New York, where he had at one time been engaged in business. He was born in 1797.

**AVIANUS**, FLAVIUS, a Latin author who lived probably in the third or fourth century of our era, and of whose writings forty-two *Æsopic fables* in poor elegiac verse are extant. The editions are those by Lachmann (1845) and Robinson Ellis (1887).

**AVIARY**, a place for keeping birds. The arrangements of an aviary depend upon the habits of its inmates, the climates suited to them, and other circumstances.

**AVICENNIA**, a genus of plants of the natural order *Avicenniæ* or *Myporaceæ*, an order very nearly allied to *Verbenaceæ*, and found almost exclusively in the southern hemisphere. This genus consists of trees or large shrubs. They resemble mangroves in appearance, and like them grow in salt-swamps. Their creeping roots often curve above the mud for the space of six feet before penetrating it, and the naked asparagus-like shoots which they throw up have a very singular appearance. *Avicennia tomentosa*, the white mangrove of Brazil, has cordate ovate leaves. Its bark is used in tanning. The *Avicennia resinifera* has a green resinous substance exuding from it which is eaten by the New Zealanders. The genus is named in honor of the Arabian physician Avicenna.

**AVIDIUS**, CASSIUS, governor of Syria. He revolted in 175, and assumed the title of Emperor. He was a general under Marcus Aurelius, and was killed by his own officers, A. D. 175.

**AVI-FAUNA**, a collective term for the birds found in any country: the fauna or zoology relating to birds.

**AVILES**, a seaport of Spain, situated near the bay of Biscay, 19 miles north of Oviedo. There are coal and copper mines in the vicinity. It has manufacturing of earthenware, glass, linen, etc. Population, 8,979.

**AVIONA**, a fortified Albanian town on an inlet of the Adriatic Sea. Population, about 6,000.

**AVISO**, a dispatch boat, a small swift vessel belonging to the navy; also used of a kind of torpedo boat.

**AVISON**, CHARLES, a musical composer, born at Newcastle, England, about 1710, and after studying

in Italy became organist in his native town, where he died in 1770. He wrote an *Essay on Musical Expression* (1752), and he composed sets of concertos and sonatas which were very popular for a time.

**AVITUS**, **ST. ALCIMUS ECDICIS**, an adversary of Arianism. He was bishop of Vienna, A. D. 490. He was a writer of poetry.

**AVIZ**, or **AVIS**, a Portuguese order of knighthood, of which the king is grand master. It was instituted in 1143 by Alphonso I, to aid in the defeat of the Moors.

**AVOCA**, or **OVOCA**, a small river in the southeastern part of Wicklow county in Ireland. It runs through a picturesque valley only a quarter of a mile wide, with wooded bank from 300 to 500 feet high. After a course of nine miles it flows into the sea at Arklow.

**AVOCADO PEAR**, **ALLIGATOR PEAR**, or **AGUA CATA**, a fruit-bearing tree of the natural order

CUSTARD APPLE.

*Lauracea*, a native of the warm climates of America. It is a slender tree with a dome-like top and grows from 30 to 70 feet in height. The leaves are similar to those of the laurel. The flowers, which are small and arid, are produced toward the extremities of the branches. The

fruit, which is like a pear in size and shape, is usually of a brown color, and has a soft yellow or greenish pulp. It is not very sweet but of a delicate flavor, which is believed to proceed from a fixed oil. It is highly esteemed in the West Indies. See **CUSTARD APPLE**, *Britannica*, Vol. VI, p. 729.

**AVOCET**, or **AVOSET** (*Recurvirostra*), a genus of birds which, although having webbed feet, is generally ranked among the *Gralla*, or *Grallatores*, on account of the length of their legs, the half-naked thighs, the long, slender, elastic bill, and the general agreement in habits with the snipe. They are distinguished from other birds, except a few species of humming-bird, by the upward curvature of the bill, which resembles a thin elastic piece of whalebone, and is most likely a delicate organ of touch, adapted to seeking food in the mud, as are their webbed feet for walking on it, and their long legs for wading in the marshes which they frequent. They are birds of powerful wing.

**AVOGADRO**, **AMADEO**, professor of physics, born in 1776, died at Turin in 1856. He formulated his law as to the Atomic Theory in 1811. Avogadro's law is of the first importance, although its bearing was not recognized until many years after its promulgation, which precedes historically that of the law of Dulong and Petit. The laws of Dulong, Petit and Avogadro constitute the main grounds for fixing the atomic weights as at present used by chemists.

**AVOIDANCE**, in English ecclesiastical law, the term by which the vacancy of a benefice, or the fact of its being void of an incumbent, is signified. Avoidance is opposed to *plenarity*, or fullness.

**AVON**, a village of New York, beautifully situated on a terrace, at an elevation of one hundred feet above the Genesee River. It is noted for its sulphur springs.

**AVONDALE**, **OHIO**, an incorporated village of Hamilton county, and a suburb of Cincinnati, from whose center it is three miles distant. Avondale railroad station is two miles from the village. Many handsome houses are in this place; also the Cincinnati Zoological Garden.

**AWE LOCH**, a lake in the center of Argyleshire, Scotland. It is about 24 miles long, and extends in a northeast and southwest direction, with an average width of from  $\frac{1}{2}$  to  $2\frac{1}{2}$  miles.

**AWEATHER**, a term used to denote the position of the helm when pressed close to the weather-side of a ship.

**AWEIGH**, a term applied to an anchor when it is just loosened from the ground. It is nearly equivalent to *atrip*.

**AWN ARISTA**, in the flowers of grasses, a solitary pointed bristle, growing either from a glume or a palea. The flowers of some grasses are entirely awnless. In many the glumes alone are awned, or only one of them; in others the glumes are awnless, and the palea, or one palea, awned. The awn is often terminal, and appears as a prolongation of the midrib of the glume or palea; from which, however, it sometimes separates below the point, and is then said to be on the back of it, or *dorsal*. Sometimes it is jointed at the base, and finally separates at the joint, sometimes it is knee-bent or geniculate, sometimes it is twisted, and liable to twist and untwist hygrometrically; sometimes it is rough, or even serrate, at the edges, as in barley; sometimes it is feathery, as in feather-grass (*Stipa*), which also is remarkable for the great length of its awn.

**AWYAW**, capital of Yoruba in Central Africa. Population, 70,000.

**AX**, the most ancient cutting instrument. Made in ancient times of stone, copper, bronze, etc. Axes are now made of iron edged with steel.

**AX**, a town in the French department of Ariège. It lies at the foot of the Pyrenees, at the junction of three picturesque valleys, 74 miles southeast of Toulouse. It is celebrated for its baths, and possesses the hottest sulphur springs in the Pyrenees.

**AXE**, the name of two small rivers in the southwest of England. One rises in the Mendip hills, north of Somerset; runs first southwest, and then northeast, through a carboniferous limestone, trias, and diluvial basin, past Wells and Axbridge, into the Bristol channel. The other rises in west Dorset, and flows 21 miles through east Devonshire in an oolitic and trias basin, past Axminster into the English channel.

**AXEL**, or **ABSALON** (1128-1201), Archbishop of Lund, in Denmark. He laid the foundation of Copenhagen, and was minister and general of King Waldemar I. He promoted art and learning, and encouraged Saxo Grammaticus to write a history of Denmark.

**AXESTONE**, a mineral, generally regarded as a variety of nephrite. It is of greenish color, is more or less translucent, hard, tough, and not easily broken. It occurs in primitive rocks, always massive, and is found in Saxony, in Greenland, and in New Zealand and other islands of the Southern Pacific. It derives its name from the use to which it is put by the natives of these islands for making their hatchets.

**AXIA**, a monumental town of ancient Etruria, discovered in 1808.

**AXIL** (*axilla*), a term applied in botany to the angle between the upper side of the leaf and the branch from which it grows. Buds generally grow in the axils of leaves, but they do not always develop. A bud may be made to appear in such a situation, and to form a new shoot, by artificial means, such as cutting over the main stem, wounding it above the place where the new branch is desired.

**AXIM**, an important station and port on the Gold Coast, a little to the east of the mouth of the Ancober River. Inland from Axim, in the basin of that river, and in the district between it and the

Prah, there is considerable gold-mining carried on. See *Britannica*, Vol. I, p. 421; Vol. X, p. 755.

**AXINITE**, silicate of alumina with boracic acid, lime etc., usually occurring in oblique rhomboidal prisms having ax-like edges. See *Britannica*, Vol. XVI, p. 411.

**AXINOMANCY**, an art practiced by the ancient Greeks, especially with the object of detecting the perpetrators of great crimes. An ax poised upon a stake was supposed to move so as to indicate the guilty individual; or, the names of those suspected being pronounced, the motion of the ax at a particular name, was accepted as a sign of guilt.

**AXIS**, in botany, a term applied to the central part, both above and below ground, around which the plant is arranged. The root is called the descending axis and the branch the ascending axis. The opposite tendencies appear as soon as a seed begins to germinate, the radicle, or root-axis descending, and the plumule or stem-axis ascending toward the light and air. That part of the stem around which the flowers are arranged is called the floral axis, and in describing some kinds of inflorescence the terms primary floral axis, secondary floral axis, etc., are sometimes employed.

**AXIS**, in geometry. The axis of a curved line is formed by a right line dividing the curve into two equal parts, so that the part on one side exactly corresponds with that on the other—as in the ellipse, the parabola, and the hyperbola. The axis of any geometrical solid is the right line which passes through the center of all the corresponding sections of it; in this sense we speak of the axis of a cylinder, a globe, or a spheroid. The axis of rotation is the right line around which a body revolves. In physical science the axis of a lens is the right line passing through it so that it is perpendicular to both sides of it, and the axis of a telescope is a right line which passes through the center of all the glasses in the tube.

**AXIS**, a genus of deer, abundant on the banks of the Ganges, but found throughout India and in many islands of the Eastern archipelago. It was known to the ancients by the name axis. One of its Indian names is chittra, and by British sportsmen in India it is often called the spotted hog-deer, though that name is also given to a rarer species. The axis has a great resemblance in size and coloring to the European fallow-deer.

**AXLE**, a shaft of wood or bar of iron which is inserted between the wheels of a wagon; also the center of revolving machinery.

**AXOLOTL**. See *SIRENOX*, *Britannica*, Vol. XXII, pp. 96, 97.

**AYACUCHO**, a town in the department of Ayacucho, in southern Peru. On the 9th of December, 1824, the last Spanish army seen on the new continent was totally defeated at Ayacucho by the combined forces of Peru and Colombia—the latter then comprising Ecuador, New Granada, and Venezuela. Population, 25,000.

**AYALA**, PEDRO LOPEZ DE, called El Viejo to distinguish him from his son of the same name. He was born at Murcia in 1332, and died at Calahorra in 1407. He was held in high esteem by several of the kings of Castile. In 1367, at the battle of Najera, the English, then in league with Peter the Cruel, took him prisoner and confined him for some time in an English dungeon. He was again, in 1385, taken prisoner by the Portuguese, at the battle of Aljubarota. He was noted as a statesman and writer, especially as a historian and poet.

**AYE-AYE** (*Chiromys Madagascariensis*), a quadruped found in Madagascar. It is about the size

of the hare, and was at first placed by naturalists among squirrels, and was ranked by Cuvier with them in the order of rodents, although Sonnerat, who discovered it, showed its affinity also to the makis or lemurs, to which family it is now pretty generally referred. See *Britannica*, Vol. XIV, p. 443; Vol. XV, p. 170.

**AYER**, PETER, one of the founders of the Shakers, born at Canterbury, N. H., in 1760, died in 1857.

**AYESHAH**, **AYESHA**, or **AISHA**, Mohammed's favorite wife, born at Medina, A. D. 610 or 611, died there about 678. She was only nine years of age when she was married to the Prophet. Ayesha was so tenderly beloved by Mohammed that he was wont to say that she would be the first of his wives to whom the gates of Paradise would be opened. Mohammedan historians state that to her charms of beauty were added a knowledge of mathematics, rhetoric and music. She was accused of adultery, but Mohammed produced a revelation from heaven to the effect that she was innocent, so he punished her accusers, and made it an article of faith that whoever should not believe in her purity should suffer the pains of hell forever. By request Mohammed in his last illness was taken to the house of Ayesha, and there expired in her arms. After Mohammed's death, Ayesha was active in the plot which deprived Caliph Othman of his power and life, and was leader of a force to resist the accession of Ali.

**AYLOFFE**, SIR JOSEPH, a celebrated English antiquary, born in the parish of Framfield, Sussex, about 1708, died in 1781. He was elected a Fellow of the Royal Society in 1731, and in the following year a Fellow of the Society of Antiquaries. He was one of the first council of this society after receiving its charter of incorporation in 1751, and was made vice-president some years after.

**AYMAR**, JACQUES, a professor of the art of divination, born in France in 1662. In 1692 a murder and robbery were committed in Lyons, and Aymar was called upon to detect the perpetrators. In some manner he succeeded in discovering one of the criminals. He was then called upon to go to Paris to exhibit his powers before the Prince de Condé, but, utterly failing in his attempts, he was forced to confess himself an impostor, and was sent back in disgrace.

**AYMARAS**, a race of partially civilized South American Indians, closely related to the Quichuas or Inca people, whom they resemble in appearance and somewhat in language. The two races formed the chief population of the ancient Peruvian empire, the Aymaras inhabiting the fertile valleys of the Andes. They were skillful in architecture, many of their monuments still remaining. They were also expert workers in gold and silver. As Sun-worshippers they claimed Lake Titicaca as the ancient center of their religion, believing that the orb periodically disappeared, and that, after an interval of darkness, it again emerged from the Sacred Isle of that lake. At the present time the Aymaras number about 200,000, located in the provinces of La Paz and Oruro in Bolivia and in the Peruvian province of Puno. They are small of stature, have brown complexion, regular and strongly-marked features, and straight black hair. They are now zealous Roman Catholics, though still retaining certain heathen observances. They cherish the memory of their ancient empire and hope for future independence. In 1780, together with the other Peruvian Indians, they revolted and massacred thousands

AYE-AYE.

of the Spaniards, and during the war of the provinces for independence they opposed both parties and gave much trouble. See *Britannica*, Vol. IV, p. 15; Vol. XVIII, p. 676; Vol. XX, p. 364.

**AYMESTRY LIMESTONE**, a well-marked horizon in the Ludlow group of the Silurian system. It is a somewhat dark-gray concretionary rock, consisting of thin beds which attain a united thickness in places of 150 feet. It is well developed at Aymestry, in Herefordshire, near Leominster, but thins off entirely at no great distance from that place. One of its most characteristic fossils is *Pentamerus Knightii*, a brachiopod. See *Britannica*, Vol. X, p. 336.

**AYMON**, the surname of four brothers, called respectively Alard, Richard, Guiscard, and Renaud. They were sons of Aymon, or Haimon, Count of Dordogne, and were conspicuous among the most illustrious heroes of the chivalric poetry of the Middle Ages.

**AYORA**, a town of the province of Valencia, in Spain. Population, 5,412.

**AYRES, DANIEL M. D., LL. D.**, an American surgeon and philanthropist. Entered Wesleyan College in 1838, and after three years of study went to Princeton to spend a year in scientific work under Prof. John Henry. Three years later he began the practice of medicine in Brooklyn, and quickly became successful. His worthy professional services brought him membership in several foreign medical societies. Wesleyan University conferred the degree of Doctor of Laws upon him in 1856. In 1857 he became Professor of Surgery in the Long Island Medical College, filling this chair until 1875, when he was made Professor Emeritus. He has taken great interest in scientific study, and in the summer of 1889 gave \$25,000 in money and land of equal value for the endowment of the chair of biology at Wesleyan. At the semi-annual meeting of the trustees of Wesleyan University, held Dec. 13, 1889, Dr. Ayres presented to the board cash and approved securities to the amount of a quarter of a million dollars, accompanying the gift with no restrictions, save that the money be devoted to the promotion of scientific study in the University. This magnificent and unsolicited donation will promote in every line the scientific work of a college which was among the first American institutions to recognize the importance of natural science in the scheme of liberal education.

**AYRES, ROMEN B. (1825-1888)**, American soldier, born in Montgomery county, New York, Dec. 20, 1825. Attended the U. S. Military Academy at West Point, from which he graduated in 1847, and as brevet second lieutenant of the Fourth Artillery served during the final operations of the war with Mexico. From the close of the Mexican war until the opening of the civil war he was engaged in garrison duty, first as second lieutenant and later as first lieutenant of the Third Artillery. On the breaking out of hostilities in 1861 he was promoted to a captaincy in the Fifth Artillery, and was engaged at Blackburn's Ford, July 18, and three days afterward at Bull Run. He became chief of artillery and participated in the Peninsular and Maryland campaigns. At Chancellorsville he commanded a brigade in the Fifth Corps, and at Gettysburg and afterward throughout the war a division of the same corps. He was brevetted major for his gallantry at Gettysburg, lieutenant-colonel for the Wilderness campaign, colonel for the battle on the Weldon Railroad, brigadier-general for Five Forks, and major-general for gallant and meritorious services in the field during the war. After the war he was appointed lieutenant-colonel of the Twenty-eighth Infantry, but was transferred

to the Third Artillery in 1870, and became colonel of the Second in 1873. He died at Fort Hamilton, Dec. 4, 1888, and was buried with military honors in Arlington Cemetery.

**AYUNTAMIENTO**, the name given in Spain to the councils or governing bodies of towns. The ayuntamiento, with the alcalde as president, is appointed by the free choice of the people, and is entitled to exercise the highest functions within the circle of its jurisdiction. The government can provisionally annul its acts, but must afterwards procure the ratification of the cortes, by which alone an ayuntamiento can be dissolved. The ayuntamientos are empowered to make up the lists of electors and jurors, to organize the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and to manage the funds of the commune.

**AZADIRINE**, occurring in the *Melia Azedarach* of the East Indies—a tree popularly known as the "Pride of China"—is a bitter principle, sometimes used as a substitute for quinine.

**AZALEA**, a genus of plants belonging to the natural order *Ericaceæ*, and distinguished from *Rhododendron* by the flowers having five stamens instead of ten, and some of them having thin deciduous leaves. Some botanists unite the genus *Azalea* to *Rhododendron*. The most noticeable of the species is *Azalea pontica*, a shrub native to the countries around the Black Sea. It grows from three to five feet high, has large obovate or oblong oblanceolate shining leaves, and very fragrant umbellate yellow flowers, which are covered externally with glutinous hairy glands.

**AZAMGARH**, or **AZIM'S FORT**, a town in the northwest of India, situated on the river Tons, 31 miles north of Benares. It was founded in 1665 by Azam Khan, a large landholder in the neighborhood. Population of town, 16,000, of whom about 10,000 are Hindus, the rest Mohammedans. The district of Azamgarh in the Benares division is low and remarkably level. The soil is fertile, with the exception of tracts amounting to about one-fourth of the whole, which are irreclaimably barren, from being impregnated with a saline substance. Magnificent crops of sugar-cane, rice and indigo are produced. Area of district, 2,147 square miles; population, 1,604,654.

**AZANI**, a city in Asia Minor, where are still seen the ruins of a theater and an Ionic temple of Jupiter.

**AZARIAH**, a name often occurring in the Scriptures; the King of Judah, 809 B. C.; one of Daniel's three friends, 605 B. C.

**AZAZEL**, a name occurring in Leviticus xvi, in the account of the rites of the Day of Atonement, explained by some as the "scapegoat" which was let out into the Wilderness laden with the sins of the people; by others, as a designation of the being to whom the goat was sent—Satan, according to Hengstenberg, or a demon of the pre-Mosaic religion, according to Ewald.

**AZELAIC ACID** is formed by oxidizing oleic by nitric acid.

**AZIMUTH**. The azimuth of a heavenly body is the angle measured along the horizon between the north and south point and a point where a circle, passing through the zenith and the body, cuts the horizon. The azimuth compass, similar to the mariner's compass, but more accurate, is used to take the magnetic azimuth of celestial bodies in order to find the variation of the needle by a comparison with the true azimuth. It differs from the common sea compass in that the circumference of the card, or box, is divided into degrees; also the box is fitted an index with two sights, which

are upright pieces of brass placed diametrically opposite to each other, having a slit down the middle of them, through which the sun or a star is to be viewed at the time of observation.

**AZINCOURT**, or **AGINCOURT** (ah-zhan-koor), a village of France, in the department of Pas-de-Calais. In 1415 a great battle was fought at Agincourt between the French and the English.

**AZOBEZOLE**, a crystalline substance obtained in reddish yellow scales by the action of reducing agents upon nitrobenzole.

**AZOBEZOYL**, a white crystalline substance produced in the form of a powder, by the action of ammonia on crude oil of bitter almonds.

**AZOIC**, a term applied in geology to rocks which contain no fossils. By those who deny the organic origin of Eozoön, the archæan crystalline schists (which underlie the oldest fossiliferous strata) form the azoic system.

**AZOTE** (Gr., *a*, depriver of, and *zoe*, life), the name given to nitrogen by French chemists.

**AZOTIZED BODIES**, those substances which contain azote, or nitrogen, as one of their constituents, and which form part of the living structure of a plant or animal, or are produced during the natural decay. The principal members of the group are *albumen*, present in white of eggs, and the juices of plants and animals; *globuline*, or *crystalline*, a variety of albumen found in the lens of the eye; *vitelline*, another variety of albumen composing the greater bulk of the yolk of the egg; *paralbumen*, a third variety of albumen found in the animal system during certain diseases; *fibrine*, which occurs largely in the seeds of cereals and in animal muscle; *caseine* (or cheese matter), present in all milk; *legumine*, a variety of caseine found in peas, beans, and leguminous seeds in general; *gelatine*, which is present in the skin, bones, and other parts of animals; *chondrine*, a variety of gelatine obtainable from the cornea of the eye and the permanent cartilages; *isinglass*, another variety of gelatine manufactured from the inner membrane of the floating bladder of sturgeons and other fishes; *glue* and *size*, which are secondary forms of gelatine; *urea*, *uric acid* and *hippuric acid*, which are present in the urine of the higher animals; *kreatine* and *kreatinine*, occurring in the juice of flesh; several forms of *urinary calculi*, which are found as stone in the bladder and a very large and important class of *alkaloids*, including strychnine, morphine, quinine, etc.

**AZOXYBENZOLE**, needles of a beautiful yellow color, produced from an alcoholic solution of nitrobenzole by the action of potassic hydrate.

**AZRAËL**, in Moslem mythology, with Gabriel, Michael and Israfel, the group of the four highest angelic beings who surrounded the throne of God. Called the "Angel of Death," it is he who separates the soul from the body. He is sent by Allah, and executes his commissions. No idea of degradation is attached to him in the Moslem mind. He seems rather to have been identified with Fate without any special malignity inherent in his nature.

**AZTEC CHILDREN**, a boy and girl of diminutive size, aged respectively 17 and 11 years, repre-

sented by showmen as descendants of the ancient Aztecs, but now considered as mere dwarfs. The height of each was less than three feet.

**AZTECS**, the name of the people who inhabited the Mexican table-land at the time of the conquest of Mexico by Cortes, and with whom his name is indissolubly associated. By their own annals they came originally from Aztlan to Mexico, driving out the Toltecs, and founding the City of Mexico about 1216-1325, the ascribed dates varying. The Aztecs soon became the most aggressive and important nation of Mexico. Though they were essentially a fighting race, subduing all the surrounding nations, they seem to have made no little progress in the peaceful arts, many of which they learned from the Toltecs. Prescott says that at the opening of the 16th century the Aztec dominion stretched across the continent from the Pacific to the Atlantic. The form of government was that of an "elective monarchy," the king being chosen by a species of suffrage, and each successive ruler was either a brother or a nephew of his predecessor, so that royalty was confined to a single line of descent and was always in the same family. The religion of the Aztecs was a gross polytheism, and frequent human sacrifices were made, as many as 20,000 annually being slain. They were ignorant of the art of writing, so their laws and public announcements, other than oral communications, were promulgated by means of picture-writing. They possessed a wonderful knowledge of astronomy, understood the theory of the seasons, predicted eclipses, set their time by the movements of the planetary bodies, measured the hours of the day precisely, and calculated the exact length of the tropical year. Agriculture was the chief industry, the staple crops being maize and the agave, or Mexican aloe, which supplied them with food, drink and raiment. Though unacquainted with the uses of iron, they discovered an admirable substitute in a metal or alloy resembling bronze, but of exquisite hardness and temper, of which they formed their tools and implements of warfare and the chase. They were also clever workers in gold and silver. The vandal Spanish priests destroyed nearly all the manuscripts of picture-writing which they found, on the plea that they were idolatrous, and no key to their hieroglyphics has ever been found. The reader is referred to Prescott's *Spanish Conquest of America* for a fuller account of this most interesting people. See *Britannica*, Vol. III, p. 172; also *Mexico*, Vol. XVI.

**AZUA**, a town of San Domingo. Population, 6,000.

**AZUAGA**, a town of Estremadura, Spain. Population, 6,400.

**AZULINE**, a blue dye made from coal tar.

**AZULINIC ACID**, a brown-colored acid, produced by the spontaneous decomposition of Prussic acid.

**AZURE**, a French word technically used in heraldry to signify blue. It is always represented by horizontal lines in engraving coats of arms.

**AZURINE** (*Lenciscus ceruleus*), a fresh-water fish of the same genus with the chub, roach, etc., and similar to the rudd or red-eye (*L. erythrophthalmus*), from which, however, it is easily distinguished by its slate-blue colored back and white abdomen and fins.

**AZURITE**, a name given to the mineral commonly called lazulite, and to which belong lapis-lazuli, or *azure-stone*, mineral turquoise, etc. It is sometimes called by the generic name *azure spar*. Mineralogists give the name azurite to an ore of copper, generally known as blue copper, closely allied to malachite.

AZIMUTH COMPASS.—a. b. sights.

## B

## BABA—BABINGTON

**BABA**, a Turkish word signifying *father*, originating like our word *papa*, in the first efforts of children to speak. In Persia and Turkey, it is prefixed as a title of honor to the names of ecclesiastics of distinction.

**BABA**, a legendary being known among the ancient Slavs as the thunder-witch, and supposed to be the devil's grandmother. She was represented as a vicious little old woman, having knotted hair, a very large nose and sharp, protruding teeth, and being borne swiftly through the clouds in an iron mortar. The modern Czechs call her the Iron or the Golden Baba.

**BABA CAPE**, a bold, rocky headland near the western extremity of Anatolia, the (Lectum of the Greeks,) in lat.  $39^{\circ} 29' N.$ , long.  $24^{\circ} 6' E.$ , about 12 miles from the northern extremity of Mitylene, the ancient Lesbos.

**BABAHYO** (sometimes called Bodegas), a small town in Ecuador, South America, situated on the Guayas River. In warehouses here are stored goods which have been sent from Guayaquil, and are to be carried into the interior. The place is famous as a depot for this carrying trade.

**BABBITT**, EDWIN B., soldier, born in Connecticut, about 1802, died at Fortress Monroe in 1881. He graduated from West Point in 1826, and served in the Florida and Mexican wars. Brevetted major May 30, 1848, and brigadier-general in 1865. He served in the departments of Oregon and the Pacific until his retirement in 1866, as chief quartermaster, and as chief quartermaster of the department of the Columbia, 1866-67, notwithstanding his retirement. He had charge of the clothing depot of the division of the Pacific, 1866-69.

**BABBITT**, ISAAC, inventor, born in Taunton, Mass., in 1799, died in 1862. Being a goldsmith, his attention was turned to alloys, and he produced the first Britannia-ware made in America. His name is best known, however, from his invention, "Babbitt metal," a soft alloy prepared from copper, tin and zinc, and used in bearings to diminish friction. The invention was patented in England and in Russia, and Congress awarded the inventor \$20,000.

**BABCOCK**, CHARLES A., naval officer, born in New York in 1833, died in New Orleans in 1876. He was appointed midshipman in 1850, passed midshipman in 1856, lieutenant in 1859, lieutenant commander in 1862 on the *Morse*, of the North Atlantic blockading squadron. In 1864 he was fleet-captain of the *Mississippi* squadron, and later commanded the *Nyack*, of the South Pacific squadron.

**BABCOCK**, HENRY (1736-1800), a son of Chief Justice Babcock, of Rhode Island. He graduated at Yale, entered the army, and at eighteen years of age had become a captain, and served under Colonel Williams at Lake George. In 1758 he was colonel of a Rhode Island regiment, and in the attempt to capture Ticonderoga he was wounded in the knee. In 1776 he was made commander of the troops at Newport, R. I., but, becoming insane, he was removed.

**BABCOCK**, JAMES F., journalist and politician, born in Connecticut in 1809, died in New Haven in 1874. For thirty-one years he edited the "Palladium." He was collector of the port of New Haven under

Presidents Lincoln and Johnson, and was elected by the Democrats in 1873 to the State legislature, and by that body was made judge of the police court in 1874.

**BABCOCK**, JAMES FRANCIS, born in Boston, Mass., in 1844. He was professor of chemistry in Boston University for five years and in the Massachusetts College of Pharmacy. For ten years he was State assayer of liquors. He invented a fire-extinguisher that has come into general use.

**BABCOCK**, ORVILLE E., born in Vermont in 1835, and graduated at West Point in 1861. He was at the surrender of Vicksburg, at the battle of Blue Lick Springs, and at the siege of Knoxville. Promoted from captain of engineers to lieutenant-colonel, he was placed on the staff of Gen. Grant, and subsequently served with the army of the Potomac. At the close of the war he was brevetted brigadier-general of volunteers, and then colonel in the regular army, still serving on the staff of the General of the Army. When Gen. Grant became president Col. Babcock was assigned to duty with him and was his secretary. As superintending engineer of public buildings and grounds he supervised the construction of Anacosta bridge, the Washington aqueduct, the chain bridge across the Potomac, and other prominent works. Being accused of complicity in revenue frauds and indicted by the grand jury of St. Louis in 1876, he was tried and acquitted by a civil court. He died in 1884.

**BABCOCK**, RUFUS, prominent Baptist clergyman and author, born in Connecticut in 1708, died in Massachusetts in 1875. He was tutor in Columbia College, president of Waterville College, three times elected corresponding secretary of the American and Foreign Bible Society, corresponding secretary of the Sunday-School Union of Philadelphia, and of the American Colonization Society, and district secretary of the Baptist Publication Society, Philadelphia. He did much pastoral and literary work.

**BABINET**, JACQUES, a distinguished French natural philosopher, born at Lusignan in 1794, died in 1872. After the downfall of Napoleon he was successively professor of mathematics at Fontenay; professor of physics at Poitiers, and afterwards at Paris. He invented and perfected a great number of scientific instruments, and was the author of many memoirs on various branches of physical science. His labors for the promotion of science were largely in the direction of meteorology, to which science he is said to have given its name.

**BABINGTON**, ANTOX (1561-1586), born in Derbyshire in 1561, of a Roman Catholic family, exposed the cause of the imprisoned Queen Mary of Scotland, and put himself at the head of a conspiracy for her release and the murder of Queen Elizabeth. The plot was discovered and the fourteen conspirators were executed. Babington's execution took place on Sept. 20, 1586. There is some ground for believing the plot to have been fostered by Walsingham, Queen Elizabeth's secretary of state, to incriminate Mary, who was executed four months later. To the last she denied all knowledge of the letters supposed to have been written by her, consenting to the scheme.

**BABINGTON**, CHURCHILL, an English author and divine, born in 1821. He was educated at Cambridge, and in 1865 became Disney professor of

archæology; and in the following year he published the first of a long series of valuable works in that science. He has also written a number of excellent works on philology and kindred subjects.

**BABIROUSSA** (*Sus babiroussa*), a species of hog, a native of the Celebes and of the smaller islands

BABIROUSSA.

of Malaysia. It is regarded by zoologists as a distinct genus. The canine teeth of the male are powerfully developed, growing from persistent pulps; the upper ones, which are of a monstrous size, curving upwards, bearing strong resemblance to horns, for which reason the animal has been styled the horned or deer-hog. It is a good swimmer, and is generally more agile than the common hog. It often ravages maize fields, but it prefers the dense, marshy retreats of the forest. There are several species of this hog, among them the wart-hog and the wild boar.

**BABISTS**, a religious and political sect founded by Seyd Mohammed Ali in Persia, about the year 1843. The originator pretended to be a descendant of Mohammed, and took the name of Bab (*i. e.* "the point," or the originator of truth), his object being a reformation of the Mohammedan religion. He taught high morality, forbade polygamy and concubinage, encouraged benevolence, and recognized the equality of the sexes. The Bab and many of his followers suffered martyrdom, but the sect now numbers several million adherents.

**BABLAH**, or **NEB-NEB**, a name given to the pods which grow on several species of *Acacia*, in Senegal and the east, and are used for calico-printing and dyeing drab. See *Britannica*, Vol. I, p. 68.

**BABUYANES ISLANDS**, a group of small volcanic islands in the Pacific, which belong to Spain; they are situated between Formosa and Luzon Islands; they are very fertile and largely productive of sulphur; the chief islands of the group are Calayan and Babuyan.

**BABY**, FRANÇOIS, Canadian engineer, member of the executive and legislative council and adjutant for the province of Quebec. By building wharves, altering the light-house system, and introducing steam tugs on the lower St. Lawrence he did much toward improving its navigation. He died in 1864.

**BABY**, LOUIS FRANÇOIS GEORGE, Canadian statesman, born in Montreal in 1831. He represented Joliette in the Canadian parliament in 1872, 1874 and also in 1878, in which year he became a member of the privy council as minister of inland revenue.

**BABYLAS**, SAINT, the martyred bishop of Antioch, who suffered death A. D. 259.

**BABYLON**, name of a village and township of Suffolk county, New York. The village, which is situated on the south shore of Long Island is the southeastern terminus of the Central Railroad of Long Island, and is connected by ferry with Fire Island. It has a healthful climate and is a pleasant summer resort.

**BABYLONIA AND ASSYRIA**. See *Britannica*, Vol. III, pp. 183-94. See also under **INSCRIPTIONS**, Vol. XIII, 114; **NEMISMATICS**, Vol. XVII, 650; **POTTERY**, Vol. XIX, 604. The exploration of historic sites, of which Layard was the pioneer, is still being prosecuted with undiminished ardor in the same part of the world. The recent progress of Assyriology tabulates the results of discoveries and excavations, and records purchases of antiquities in such numbers as to have formed the staple of many auction sales. One of these sales was of a collection of clay tablets found in the ruins of Sippara, most of which dated from the early period of the first Babylonian empire. Consisting largely of business contracts, they attest the business activity of the rising em-

pire. A marriage contract was of special significance, as being unique among the documents of this epoch. Among the tablets, one was the summing up and judgment in a lawsuit of the thirteenth year of Nabonidus. Many of these tablets were astronomical. Among other results of the most recent activity in this direction is the issue, by the Royal Museum of Berlin, of a classified catalogue of oriental antiquities contained in the Babylonian and Assyrian sections. The same institution has also in progress (1891) a series of communications on the oriental collection of the museum, in one of which Dr. Hugo Winckler describes a treasure of cuneiform inscriptions recently found in Egypt; and in another of which he attempts the solution of the embarrassing problem concerning the rise and development of the ancient Mesopotamian kingdoms.

**BACCARAT**, a French game of cards, in which each player or better deposits a stake which in each case is duplicated by the "banker." Then the banker deals two cards to each player, including himself. Each individual bet is decided by comparison of the total count held by each better with that held by the banker. Generally, in Europe, the court cards count 10 each and the others count according to the spots. The counts range in value by series of 9, 19, etc., and 8, 18, etc., the 9 range being the highest or best count. More cards may be called for by any player, but at the risk of making his count exceed 29, in which case the excess forfeits his bet. If the player's cards count 9 he declares it, when all who hold hands superior to that of the banker may claim the amount of their bets, and the banker claims the other stakes. As played in American games court cards and tens do not count.

**BACCHANALIA**, the feasts observed among the Romans and Greeks in honor of Bacchus. With these feasts theatrical representations originated.

**BACCHANTES**, the Latin name for those who assisted in the bacchanalian revels.

The term is usually applied to the priestesses of Bacchus, who are represented as carrying a thyrsus: a spear twined with ivy and vine branches, or with its head thrust into a pine cone.

**BACCIOCHI**, MARIA BONAPARTE, born at Ajaccio, Corsica, in 1777, died at her home, near Trieste, Aug. 7, 1820. In 1805 Napoleon Bonaparte, of whom she was the eldest sister, made her Princess of Massa, Lucca, Carrara and Piombino, and in 1809 she received the title of Grand-duchess of Tuscany. She was exiled with her brother. Her husband survived her twenty-one years and her son thirteen years. The Countess Camerata, her only daughter, died in 1869.

**BACHARACH**, a small town of Rhenish Prussia, on the left bank of the Rhine, situated in a vine-growing country. The name is said to be derived from a rock in the Rhine, called *Bacchi ara* (altar of Bacchus), whose exposure in very dry weather is regarded as prophetic of a good vintage. It was here that Blücher (Jan. 1, 1814) crossed the Rhine in pursuit of Napoleon's army.

**BACHE**, BENJAMIN FRANKLIN (1769-1798), son of Richard Bache and grandson of Benjamin Franklin. While a boy he went to Paris with his grandfather and learned printing and type-founding in the establishment of the brothers Didot. Returning to America he published the "General Advertiser," which was one of the most influential journals of the time, and was opposed to the administrations of Presidents Washington and Adams.

BACCHANTES.

**BACHE, FRANKLIN**, son of Benjamin Franklin Bache, born in Philadelphia in 1792, died there in 1864. He received his medical diploma from the University of Pennsylvania in 1814, and was appointed surgeon in the army. In 1816 he began the practice of his profession in his native city, where he occupied many important positions. He was president of the American Philosophical Society in 1854 and 1855, and of the deaf and dumb asylum corporation at the time of his death. He was the author, compiler, and editor of a number of standard works on chemistry and cognate subjects, and a large contributor to scientific journals.

**BACHE, HARMAN**, born in Philadelphia in 1797, died there in 1872, son of Benjamin Franklin Bache, engineer, graduate of West Point 1818, was employed under the direction of the war department for forty-seven years. In 1867 he was placed on the retired list. In 1865 he was brevetted brigadier-general for meritorious service—the highest grade in the engineer corps. The construction of the Delaware breakwater and the successful application of iron-screw piles for the foundation of light-houses on reefs and shoals were among his conspicuous works. He was a member of the light-house board from 1862 to 1870.

**BACHE, RICHARD**, followed his brother Theophylact to the colonies, and in 1770 became his agent in Philadelphia and accumulated a fortune. In 1767 he married the only daughter of Benjamin Franklin, whom he succeeded as postmaster-general in 1776. He was born in Settle, Yorkshire, England in 1737, and died in 1811 in Pennsylvania.

**BACHE, SARAH**, only daughter of Benjamin Franklin, and wife of Richard Bache, born in 1744, died in 1808. During the war for Independence she was untiring in her efforts to mitigate the hardships of the soldiers, for whom she collected large sums of money and hospital stores. She had eight children.

**BACHE, THEOPHYLACT** (1734-1807), merchant, came from Yorkshire, England, in 1751 to New York, where he engaged in business, and becoming the owner of vessels engaged in privateering. He was prominently connected with the events leading to the war of the Revolution, but on account of his neutrality incurred the suspicions of the Committee of Safety when hostilities began. Remaining in New York during the British occupation, he was able to render assistance to loyal officers held as prisoners of war.

**BACHELOR'S BUTTONS**, a name given to several species of *Ranunculus*, and also to some other flowers which are shaped like buttons, as the corn flower (*Centaurea cyanus*).

**BACHMAN, JOHN**, a distinguished American naturalist, born in Dutchess county, New York, in 1790, died in 1871. He was pastor of a Lutheran congregation in Charleston from 1815 to the end of his life. He is best known for his valuable contribution to natural history, and as the associate of Audubon in the preparation of the great work of the latter on ornithology.

**BACHMUT, or BAKHMOT**, a town of Russia, in the province of Ekaterinoslav; is a market for trade in tallow, meat, grain, horses and cattle; there are coal mines in the vicinity; here are the remains of an ancient Tartar wall.

**BACHILLUS** is the name commonly applied to Bacteria, although it properly belongs to a separate genus of *Schizomyces*.

**BACK**, in maritime language, has many technical applications. To *back an anchor* is to support the large anchor by a smaller one in order to prevent it from loosening and coming home in bad ground. To *back and fill* is a mode of tacking when

the tide is with a vessel, but the wind against her. To *back the sails* is so to arrange them as to make the ship move astern or backwards. To *back the maintop-sail*, and analogous operations to other sails, is so to arrange a sail that the speed of the ship's progress may be checked.

**BACK, SIR GEORGE, F. R. S., D. C. L.**, a British navigator who attained the rank of admiral, born in Stockport, Nov. 6, 1796, died June 23, 1878. In 1819 he accompanied Sir John Franklin when he made his arctic voyage, and he was sent out in 1833 to search for Captain Ross. He published an account of his arctic voyages. See *Britannica*, Vol. X, p. 193; Vol. XIX, pp. 319, 320.

**BACKER, VAN, ADRIAN**, a Dutch portrait and historical painter, who lived between 1643 and 1686.

**BACKUS, ISAAC**, an American clergyman and writer of religious history, born in Norwich, Conn., in 1724, died in 1806. His literary reputation rests principally upon his *History of New England*, with *Special Reference to the Baptists*.

**BACON**, from a root of the Teutonic languages, which seems to be allied to the Latin *vacca*, a cow, and to have signified an animal in general, is the cured sides of a pig.

**BACON, DELIA**, the daughter of David Bacon, missionary to the Indians, and the sister of Dr. Leonard Bacon, the eminent Congregational divine, born at Tallmadge, Ohio, Feb. 2, 1811, died at Hartford, Conn., Sept. 2, 1859. For some time she was a teacher and lived near Boston, where she delivered a course of lectures. She wrote *Tales of the Puritans*; *The Bride of Fort Edward* (a drama); and *Philosophy of the Plays of Shakespeare Unfolded*. The latter raised much criticism, as in this work she sought to prove that the Shakespearian plays were the joint work of Shakespeare, Bacon, and other writers.

**BACON, LEONARD**, a distinguished American clergyman, born in Detroit in 1802, died in New Haven in 1881, having been pastor of a congregation in that city 57 years. He was successively professor of didactic theology and lecturer on church polity and history in Yale College. He was an able lecturer and a voluminous writer. He assisted in founding the "Independent" and the "New Englander," and wrote numerous works on Christianity and kindred topics. He was a strong supporter of the anti-slavery cause and a staunch Unionist throughout the war.

**BACON, LEONARD WOOLSEY**, son of the preceding, born in 1830. He has been pastor of churches in many of the largest cities of the United States, and is a prolific writer for the periodical press and of books and musical compositions.

**BACON, NATHANIEL**, born in London about 1630, died in 1677. He left England and settled in Virginia, becoming in 1672 a member of the council. The people chose him to lead a force against the Indians. Governor Berkeley was indignant at this evidence of his popularity, and on his return from a successful warfare against the Indians declared Bacon a traitor. He was captured, tried and acquitted. Governor Berkeley was obliged to promise him a commission, but delayed to give it, and Bacon at the head of a force compelled him to fulfill his promise. He marched against the Indians, and during his absence was proclaimed a rebel. Bacon returned and drove the governor from Williamsburg. After this he burned Jamestown, and Governor Berkeley was obliged to flee to a ship. The Bacon rebellion ended with the death of Bacon and the execution of his principal adherents.

**BACS, or BARS**, a village and county of Hungary, situated on the Danube. The chief city of the county of Bacs is Zombor.

BACTERIUM, a microscopic organism belonging to the class *Algae*, usually in the form of a jointed rod-like filament, and found in putrefying infusions or tissues. The plural, bacteria, is an other word for bacilli. Early in the use of the microscope the general name applied to all minute or microbic organisms was *animalcule*; later they were called infusoria, and still later microbes, or microbic organisms. For an elaborate account of the discovery of bacteria and their classification and numerous illustrations of the various species revealed by the microscope, see the article SCHIZOMYCETES, Britannica, Vol. XXI, pp. 398-407; also under SURGERY, Vol. XXII, pp. 679-80; also under MURRAIN, Vol. XVII, p. 59 (*Bacillus anthracis*); also under BIOLOGY, Vol. III, pp. 680-688; also under PATHOLOGY, Vol. XVIII, pp. 401-407; also under FUNGUS (Order VI), Vol. IX, p. 836; also under FERMENTATION (Class B), Vol. IX, p. 97; also under DIPHTHERIA, Vol. VII, p. 249.

It is only needful, in these Revisions and Additions, that the chief facts concerning bacteria be restated and summarized in the light of the more recent experiments. Professor Ray Lankester, of London, in the "Pall Mall Budget," of Jan. 1, 1891, in an incisive discussion of the different forms of bacteria in general and of the *Bacillus tuberculosis* in particular, states that the bacillus (a little rod), like the similar name bacterium, is commonly applied to the rod-shaped forms of a group of minute plants which botanists know by the title, "Schizomycetes," translated by German naturalists as Spaltpilze (splitting molds). The word *schizomycetes* refers to the mode of multiplication of these little rods. They attain a certain length and then divide across into two. Each half grows to the size of the parent and then similarly divides, and so on as long as food and other conditions of their life are present. One species (that common in old hay) has been observed to divide in this way every half-hour—a rate which gives in twenty-four hours more than three hundred billions (300,000,000,000) of individual rods as the offspring of one parent rod. They are extremely minute, varying from the 1-20,000th of an inch to the 1-1,000th of an inch in length. Some idea may be formed of this smallness by examining the drawings of different shapes assumed by these little plants given in Fig. 1, and reflecting that if a drawing of a well-grown man were made to the same scale of magnification the drawing would have to be a mile and a half long. Rods are by no means the only shapes under which the *Schizomycetes*, or, as it is convenient to term them, the "bacteria," present themselves. They often split up so far as to become tiny spheres, when they are called "micrococci" (a). The commonest form is biscuit-shaped (c), and very often the rods, instead of breaking as they grow, elongate so as to become long filaments called "the leptothrix form," consisting of several segments adhering to one another (f). The filament as it grows may take a spiral twist, when it is called "spirillum" (h); and should it then break into segments, as it often does, each segment is called a "comma" or "comma bacillus" (i). A less twisted form than the spirillum is the "vibrio" (g). French writers have applied the word "vibrio" to the whole group of *Schizomycetes*, just as we use the word bacteria in a wide sense; and Pasteur also uses the word "microbe" (microbiont—"minute living thing") for bacteria and other kinds of extremely minute organisms. All the forms which are drawn in Fig. 1 may be assumed according to the conditions of growth by one and the same race or species of bacteria, but some seem to be more limited than others as to changing their form of growth. A good

many are known only as micrococci; some are known which grow for a time as bacilli, or rods (e, k), and then many break up and continue to grow as micrococci.

FORMS OF BACTERIA.

(a) Coccus or micrococcus; (b) diplococcus; (c) biscuit-shaped, or cithridium (with vibratile filaments of protoplasm); (d) microbacillus, being a single segment of (e) bacillus; (f) leptothrix or filamentous form, divided into segments; (g) vibrio (with vibratile filaments); (h) spirillum (with two vibratile filaments at each end); this breaks up into segments, shown in the next drawing; (i) the comma, or comma bacillus; (j) bacillus (with vibratile filaments); (k) diamond or double cone (this is the form of the bacterium of fowl-cholera); (l) the tubercle bacillus, showing the moniliform shape of the protoplasm as seen when stained with aniline dye; (m) a bit of the leptothrix form of the anthrax bacterium, showing the formation of spores in separate chambers; (n) a chain of micrococci, called streptococcus; (o) tessellate growth of a biscuit-shaped bacteria; (p) network-like growth of bacilli; (q) branching growth of filaments (cladotrix form); (r) chain of small and large micrococci (morsiform); (s) two micrococci imbedded in jelly; (t) a spirillum with jelly envelope (leuconostoc); (u) jelly with imbedded biscuit-shaped bacteria; (v) and (s) are less magnified than the other figures, which are 1,200 times longer than the natural objects.

BACTERIA: "SWARMING" AND AT REST. The bacteria, like all living things, consist essentially of "protoplasm," which is covered with a delicate but firm wall, which protects it. Sometimes the case or wall swells up and forms a jelly (Fig. u, w), in which protoplasm is imbedded like a dot, and often millions of bacteria are found adhering to a mass by means of this jelly (x). Often, but by no means always, a delicate thread of protoplasm hangs from either end of the bacterium (e, g, h, k).

and keeps up a rapid vibrating movement, so that one sees under the microscope thousands of these minute bodies dashing along to and fro, driven by their vibrating threads or flagella. Some will be thus "swarming" while others are at rest. This motile phase seems to be assumed under certain conditions by most kinds of bacteria.

How BACTERIA DIFFER FROM PLANTS. The nearest allies of the bacteria among larger plants are the blue-green growths which one may see on the mud of some ponds and streams. Such blue-green growths are readily seen with a hand-glass to be made up of countless filaments felted together. They are known under the name of *oscillatoria*. They differ from the bacteria only in being larger and in being green. It is owing to the fact that the bacteria are not green like ordinary plants that they have such immense interest and importance. The green color of plants in general is due to a peculiar chemical body (chlorophyll), in virtue of which, in the presence of sunlight, the green plants are able to take the carbon necessary for their food from carbonic acid gas. Animals and colorless plants like the bacteria cannot do this. The gas in a glass of soda-water will not satisfy a hungry man, but a green plant will get along very well with this and some smelling-salts; it will flourish, grow, and reproduce itself from generation to generation. The bacteria, on the contrary, are like animals in their requirements as to food. They must have food consisting of the products or actual substance of other plants or of animals. Like animals, they have to act chemically upon this food by digestive juices. Being so small, they do not, like animals, take their food into their inside and

invention of arithmetical nomenclature—nonillions!

"BACTERIA BROTH." As a consequence of their enormous fecundity it will be readily understood that they are ubiquitous. Every surface teems with them; all natural waters are infested by them; even the skin of the most washed of mankind, even the moisture of the sweetest mouth, harbors them by the million! One thing, however, they cannot stand, and that is boiling. Boil them, or the stuff in which they are flourishing, and they cease to live; in the phraseology of the "Bacteriologist," the liquid or solid substance so treated is "sterilized."

BACILLI AND MICROCOCCI IN TUBERCULAR DEPOSIT.

By means of sterilized nutriment we can test any object for the presence of bacteria. We prepare a broth suitable for their nourishment and sterilize it. If kept hermetically sealed (as are preserved vegetables and tinned meats) no bacteria will appear in the broth. Touch the broth with my lady's finger, with any stick or stone, or add to it a drop of purest spring water, and it will after a few hours swarm with bacteria and putrefy.

A VISION OF A WORLD WITHOUT BACTERIA. This was the discovery of Theodore Schwann, also celebrated for his cell theory. He showed fifty years ago that what we call "putrefaction" is not the result of death but of life. The unpleasant smell and the disintegration of dead bodies, whether of plants or animals, is entirely due to the bacteria—it is the accompaniment of their digestion. If you destroy all the bacteria present by means of boiling heat, and then prevent the access of new bacteria (which are blown about in the dust of the air), dead bodies never putrefy. Supposing that by the fiat of an Omnipotent Being all bacteria could be annihilated, the earth's surface would soon be covered with dead bodies remaining unchanged year after year, century after century. The seas and lakes would be choked with them, and we should have to use them for paving our roadways and building our houses. But, worse than that, all the carbon and nitrogen which we living beings use in turn in our successive occupancy of the earth's surface from generation to generation would soon be tied up. There would be no food for the green plants; herbiferous creatures would cease to exist. The contemplation of these imaginable horrors gives us some notion of the part played by bacteria in the order of Nature.

VARIETIES OF THE INVISIBLE WORLD OF BACTERIA. All bacteria are not alike in their requirements as to food and in the substances—variously smelling, variously colored, poisonous or harmless, liquid or gaseous—to which they give rise; just as some animals are herbivorous, some carnivorous—as some produce musk, some ambrosia, others venom, others wax and so on—so do we find variety in this invisible world, rendered visible only by the modern microscope. There are kinds—species, as the naturalist says—of bacteria as distinct from one another as the cow and the skunk. The commonest species are those which live on ordinary vegetable and animal refuse. They make a good deal of disagreeable smell, but there is not much harm in them, and, like the manufacturing chemists, who, next to bacteria, are of all beings the most offensive to the olfactory sense, they perform valuable service by manufacturing soluble ammonia and nitrates

VARIOUS BACTERIAL FORMS.

1. *Micrococcus septicus*; a, scattered; b, in chains—torula. 2. Same in zoogloea form. 3. *Bacterium termo*. 4. Same—zoogloea. 5. *Bact. lincolni*. 6. *Bacillus subtilis*. 7. *Bacillus anthracis* and blood corpuscles. 8. *Bacillus* (from mouth) with cilium. 9. *Bacillus leproe*. 10. *Bacilli* with spores. 11. *Bacillus malarie*. 12. *Vibrio* serpens. 13. *Spirillum Obermieri*. 14. *Spirillum volutans*. 15. *Sarcina*. X 500. (Copied from Zehle's Path. Anatomie, Jena, 1882.)

act upon it in a stomach, but they adopt an equally efficacious method and get into their food, acting upon it and digesting it and absorbing the products of digestion as they lie in their billions wallowing, as it were, in a sea of nutriment. Just as the living protoplasm of the cells of the stomach of a man secretes ferments and acids which chemically break up and change the lumps of food he has swallowed and extract from them some nourishing matter, producing at the same time a good deal of waste, foul-smelling and various, in chemical composition, so do the little bacteria act upon the dead bodies and fragments of plants and animals throughout Nature, creeping into them, swarming round them, multiplying in numbers which cannot be expressed even by the word millions, but require the highest

(the food of green plants) from the viscid and solid carcasses which once were living.

KOCH'S DISCOVERY OF TUBERCULAR BACILLI; TUBERCULOSIS AND ITS REMEDY. With regard to this discovery, Dr. Koch gave the following account in an interview with a medical correspondent of the *New York Sun*, in December, 1890:

I discovered the tubercular bacillus eight years ago. It was at first warmly disputed, but it is now generally admitted. I have ever since then been engaged in the study of the deadly parasite, and have been endeavoring to obtain an inoculating fluid which would kill the bacilli and bring about a sufficiently strong and healthy local reaction to expel them from the body without at the same time destroying healthy organisms. Of course, this latter has been the difficulty. There is very little use of my saying just now what the inoculating fluid is, or how I obtained it. It has cost me years of my life, and I propose to retain the secret for a few weeks longer from publicity, though it is already known to my assistants and to many of my professional friends. Now we will sum up the results of the treatment so far in the cases in which the physical condition of the patient was good. Lupus has yielded easily to the inoculating treatment, even when the cases had been of many years' standing. The bacilli have been destroyed completely after a number of injections, of course, varying with each case, and the web of lupus has in some cases been sloughed off, but in the majority it has been easily removed surgically. The narbe or star which marks the spot where it existed is not so large or the disfigurement anything like so great as is the case with the sharp spoon treatment in which the tissue is scooped out. Consequently the danger of lessening the usefulness of the affected limb is much less, and I think the danger of a recurrence is also lessened. Now, as to the effect upon living tuberculosis. Though the disclosure is premature, I will tell just how we stand. I have twenty patients with whom I personally follow the treatment minutely, and they represent (and I have, of course, chosen them on this account) the graduated stages of the disease. In fifteen of these patients the bacilli have completely disappeared from the sputa. They have gained much in weight, in general appearance, and in spirits, which last is a not to be neglected symptom. In the remaining five cases I regret to say there is not the slightest indication that the ordinary course of the disease has been stopped. These are cases in which I found already large cavities in the lungs. In these, the cough, the rattle in the throat, and the almost undiminished number of bacilli in the sputa continues. All of these symptoms, I repeat, have disappeared in the other cases. Of course, nothing can be considered final yet, the first injection to a human being having only been made seventy days ago. I hope for good results in all cases in which the vital organs are intact.\*

Professor Koch, in an article in the "*Deutsche Medizinische Wochenschrift*," describes the lymph as consisting of a brownish transparent liquid. It is so prepared as to be proof against deterioration. When,

however, it is diluted with water to the necessary degree for use, the matter is liable to decay. It is necessary, therefore, that the attenuations should be perfectly sterilized by heat and preserved in wadding covering, or prepared with a solution of phenol 50 per cent. strong. When taken into the stomach the curative matter proves to have no effect. It must be applied subcutaneously by means of a valveless syringe. The kind of a syringe recommended by Professor Koch is one furnished with a small hollow rubber ball. In thousands of cases, he says, where it has been used for subcutaneous injections, not a single abscess resulted. When the curative matter is applied to a patient the usual course is to inject under the skin of the back, between the shoulder blade and in the proximity of the loins. His experiments show that human beings are much more insensible to the effect of the new substance than are guinea pigs, which have been largely used in the course of the investigations. Two cubic centimeters of the fluid applied to a guinea pig produced little, if any, apparent effect. Twenty-five hundredths of a cubic centimeter, however, intensely affected a healthy, full-grown man, who was subjected to experiment. Professor Koch experimented with the fluid upon his own body, and describes the effect. He injected twenty-five hundredths of a cubic centimeter of the fluid under the skin of his upper arm. Three or four hours after the injection was made he experienced a contraction of the limbs and a marked feeling of lassitude. At the same time he felt a desire to cough, together with difficulty of breathing. These symptoms increased rapidly, and in the fifth hour he experienced an unusually violent rigor. The shivering lasted for nearly an hour, and was accompanied with nausea and vomiting. The temperature of his body rose to 39.6 centigrade. After a period of twelve hours the symptoms began to abate, the temperature of the body declined, and on the following day resumed its normal degree. The heaviness of the limbs and the feeling of lassitude, however, continued for some days, during which time the point on his arm at which the injection was made continued to be painful and remained red. The experiments so far conducted show that the lowest limit of effective strength of the fluid in a healthy human body is one hundredth of a cubic centimeter. When this amount is applied to a healthy human subject, it produces little or no reaction. The same result follows when fluid of this strength is applied to diseased persons who are suffering from other than tuberculous affections; but in persons affected with tuberculosis the same quantity produces a strong, general and local reaction. The general reaction consists of an attack of fever, which usually begins with shivering, the temperature of the body rises to over 39, and in some instances even to 41 centigrades. At the same time pains in the limbs are noticeable. The patient coughs, experiences much irritation and great exhaustion. Some patients also suffer nausea and vomiting. In some cases there is noticed a slight icteric (jaundice-like) coloring, or exanthema, resembling measles, on the chest or neck. The symptoms just described begin to manifest themselves four or five hours after the injection of the curative substance. They last from 12 to 15 hours. The patient is not much affected by the attack induced by the fluid, and after it is over feels comparatively well; even better, in fact, than before the injection. The reaction produced in the internal organs, especially the lungs, when the curative substance is injected, is not, of course, open to observation, apart from the increased expectoration and cough. Professor

\*The *Sun's* correspondent thus describes Dr. Koch's manner in the interview: "It is impossible for one to reproduce here Prof. Koch's modest, shrinking manner, and the skillful way in which he avoids all personal mention of himself in relating the story of his unique medical discovery. The patients in the *Charité* and the private clinics worship him like a god. When he appears in their wards he is hailed as a deliverer. I myself saw a patient stoop down swiftly and kiss his hand, which humage, however, made the Professor very angry. To-day Koch spoke in the highest terms of his great confrère, M. Pasteur of Paris. "We both," he said, "began to study bacteriology at about the same time, but we came to it by different ways. He began with chemistry, I with botany and the study of the plant parasite."

Koch expresses the belief that his remedy will certainly prove a cure for incipient phthisis. Whether, however, the cure will be final and definite has not, he says, been clearly proved. Further experiments and continued use of the remedy will be necessary to determine this question.

The curative properties of the new remedy, Professor Koch declares, are of still greater importance for diagnosis. What the fluid kills is not the tubercular bacillus, but the tubercular tissue. This fact indicates the well-defined limits which the efficacy of the remedy will be able to reach. In other words, it can only influence living tuberculous tissue. It has no effect whatever on dead tissue, such as decayed caseous matter, necrotic bones and the like. More than this, it produces no effect upon the tissues which have been already killed by the application of the remedy. It is quite possible that such dead tissue may still contain living tubercular bacilli. These may then be either expelled with the necrotic tissue, or it may be that under special circumstances they may again invade adjacent living tissues. It follows, therefore, that tuberculous tissue that is still living must first be made to decay. When this has been accomplished every effort must be made to remove the dead matter by surgery. In cases where this is impossible and secretion can only slowly proceed by the self-help of the organism threatened, the living tissue must at the same time be protected by continual applications of the remedy so as to guard against the re-immigration of the parasites. Patients with pronounced tuberculosis of the lungs have proved far more susceptible to the remedy than those suffering with surgical tubercular affections. As a general rule the coughing and expectorations are increased somewhat after the first injections. Then they become gradually less, and, in the most favorable cases, will ultimately wholly disappear. In the cases experimented upon under the direction of Professor Koch, the expectorations gradually lost their purulent property and assumed a mucous character. The number of bacilli expelled usually decreases only when the expectorations begin to assume a mucous appearance. The bacilli then disappear entirely for a time, but on occasions again appear until expectoration totally ceases. At the same time the night sweats cease, the patients begin to look better and to increase in weight. Patients who have been treated in the early stages of phthisis have all been freed from morbid symptoms within from four to six weeks, when they may be regarded as healed. Consumptives with large cavities in their lungs will probably only experience benefit from the new remedy in exceptional cases, though most cases show temporary improvement. Professor Koch deprecates the mechanical and indiscriminate application of the remedy. He holds that it would be preferable that the treatment should be applied in suitable institutions, where careful observation would be possible. In all cases he emphasizes the necessity of early treatment. Only in incipient stages of disease, he declares, can the remedy fully develop its efficacy.

**THE LYMPH REMEDY.** On Jan. 15, 1891, Dr. Koch, in a lengthy written statement, explained to the public the methods by which he discovered the lymph used by him as a remedy for tuberculosis. After describing his numerous experiments extending through years of investigation, resulting in finding the curative substance needed, he added: "The remedy which is used in the new treatment consists of a glycerine extract, derived from the pure cultivation of tubercle bacilli. Into the simple extract there naturally passes from the tubercular bacilli besides the effective substance all the other matter soluble in 50 per cent. glycerine. Consequently, it contains a certain quantity of mineral salts, coloring substances, and other unknown extractive matter,

some of these substances can be removed from it easily. The effective substance is insoluble in absolute alcohol. It can be precipitated by it, though not indeed, in a pure condition, but still combined with the other extractive matter. It is likewise insoluble in alcohol." Dr. Koch closes his statement with some learned technical observations on the specific action of the lymph when injected into the human system affected by tuberculosis. For these the professional reader must be referred to medical journals, in which they may be found in full.

**BACTRIS** (from a Greek word meaning a "cane"), a genus of slender palms, numbering about forty species, found along marshy regions in the tropics, where it sometimes forms impenetrable forests. The Maraja palm of this species bears a grape-like fruit, which is eatable. Toboga canes are made from the stems of *Bactris maraja*.

**BACULITES**, a genus of the fossil family of *Ammonitidae*, differing from the true ammonite in the perfectly straight form of the shell, which tapers to a point, and is either round or compressed.

**BADAGRY**, a port of Upper Guinea, from which the expedition of 1825, under Lander and Clapperton, started on an exploring tour through Central Africa. It is under British rule, and formerly traded extensively in slaves.

**BADALONA**, a Spanish seaport in the province of Barcelona, near the town of that name. It engages in ship-building and glass manufacture. The surrounding country is fertile and orange groves abound.

**BAD AXE**, a small village of Michigan and the county-seat of Huron county; it has several churches, banks, two newspapers and a lumber-mill.

**BADDERLOCKS**, or *HEXWARE* (*Maria esculenta*), an edible sea-weed of the sub-order *Fucales*, growing on rocks in deep water, on the shores of Britain, Iceland and the northern parts of Europe. It has a stem four to eight inches long, pinnated with a few short leaflets, which contain the seeds, and a membranous olive-green frond two to twelve inches long, with a stout mid-rib.

**BADÉAU, ADAM**, born in New York city, Dec. 29, 1831. He entered the United States army in 1862, and was aide to Brig.-Gen. Thomas W. Sherman. While serving in this capacity he was wounded in Louisiana. In 1864 he became military secretary to General Grant, in which capacity he remained till 1869. He was sent by the government to London and Madrid, and accompanied General Grant not only on his campaigns, but on his tour round the world. He has written a romance, a collection of essays, and two volumes on the life of General Grant.

**BADEN, GRAND DUCHY** or, a state of the German Empire. Area, 5,891 square miles. Population (1885), 1,601,255. Capital, Karlsruhe, with a population in 1885 of 61,074. For the early history of Baden, see *Britannica*, Vol. III, p. 224.

The present royal family was gazetted Jan. 1, 1891, as follows:

**Friedrich I** (reigning Grand Duke), born Sept. 9, 1826, second son of Grand-duke Leopold I, and of Princess Sophie, of Sweden. Ascended the throne of Baden at the death of his father, April 24, 1852. Married Sept. 20, 1856, to Grand-duchess *Luise*, born Dec. 3, 1838, the daughter of King Wilhelm I, of Prussia. *Offspring*:—1. *Friedrich Wilhelm*, born July 9, 1857; married Sept. 20, 1885, to Helen, daughter of the Duke of Nassau. 2. *Victoria*, born Aug. 7, 1862; married Sept. 20, 1881, to crown prince Gustaf, of Sweden.

*Brothers and Sisters of the Grand-duke*: 1. Princess *Alexandrine*, born Dec. 6, 1820; married May 3, 1842, to Duke Ernst, of Saxe-Coburg-Gotha. 2. Princess *Wilhelmina*, born Dec. 18, 1829; married Feb. 11, 1853

to Princess Marie Romanovska, born Oct. 16, 1841, daughter of the late Duke Maximilian, of Leuchtenberg. Offspring of the union are two children:—I. Princess Marie, born July 26, 1865; married July 2, 1889, to Friedrich, hereditary prince of Anhalt. 2. Prince *Maximilian*, born July 10, 1867. III. Prince *Karl*, born March 9, 1832; married May 17, 1871, to Rosalie von Buest, elevated Countess von Rhena, born June 10, 1845. IV. Princess *Marie*, born Nov. 20, 1834; married Sept. 11, 1858, to Prince Ernst, of Leiningen. V. Princess *Cecilia*, born Sept. 20, 1839; married Aug. 28, 1857, to Grand-duke Michael, of Russia.

The constitution of Baden vests the legislative authority in a house of parliament composed of two chambers. The upper chamber comprises the princes of the reigning line who are of age; the heads of the mediatised families; eight members elected by the nobility; the Roman Catholic archbishop of Freiburg; the superintendent of the Protestant Church; two deputies of Universities; and eight members nominated by the Grand-duke, without regard to rank or birth. The second chamber is composed of 63 representatives of the people, 22 of whom are elected by towns, and 41 by rural districts. Every citizen not convicted of crime, nor receiving parish relief, has a vote in the elections. The elections are indirect, the citizens nominating the *Wahlmänner*, or deputy-electors, and the latter the representatives. The members of the second chamber are elected for four years, one-half of the number retiring at the end of every two years. The chambers must be called together at least once every two years.

The Grand-duke has a civil list (including allowances to the princes and princesses of the royal household) of 1,944,840 marks—\$486,210.

The population of the nine chief cities in 1885 was reported as follows:

|                      |                      |                      |
|----------------------|----------------------|----------------------|
| Mannheim.... 61,273  | Pforzheim.... 27,201 | Baden..... 12,779    |
| Karlsruhe... 61,066  | Heidelberg... 26,928 | Rastatt..... 11,743  |
| Freiburg..... 11,340 | Konstanz..... 14,601 | Bruchsal..... 11,662 |

For the religious preferences of the people, see RELIGIONS OF THE WORLD, in these Revisions and Additions.

The statistical reports of 1890 showed that one-half of the people are engaged in agriculture, the other half mostly in manufactures. The meadows comprise 800 sq. miles, the forests cover 2,200 sq. miles, and part of the timber is exported. The chief manufactures are cigars, cotton and silk stuffs, straw hats, brushes and trinkets, clocks, chemicals, paper and machinery. There are 1,616 elementary schools, 58 colleges and other middle schools and technical academies, also two universities. There are 860 miles of railway, almost entirely belonging to the state, constructed at a cost of \$106,750,000. The government budget for 1890 was estimated at \$10,050,000; the public debt in 1886 (chiefly for railways) was \$80,920,000.

The public schools (not including private) of Baden in 1889 embraced two great universities and 1,734 others, with 4,905 teachers and 297,071 students.

BADEN, JACOB, a Danish philologist, born in Vordenborg, in 1735, died in 1804.

BADENOCH, a district of Inverness in the north of Scotland.

BADGE, a distinctive mark or sign, an honorary decoration, or special cognizance; as, for example, the badge of a society, the badge of a police, etc. Badges are either conferred by the State or assumed by the individual for purposes of distinction, the former class having very frequently had their origin in the latter. Of badges conferred by public

authority, for the purpose of inciting to exertion and gratifying honorable ambition, numerous instances are to be met with in every part of the world. The garter of the English knight, the golden fleece of the Spanish grandee, the button of the Chinese mandarin will occur as familiar examples. Of badges assumed for the purpose of distinction none are more famous than the white or red roses of York and Lancaster. Different countries have also distinctive badges, generally connected with the history either of the actual ruling or of some former dynasty. The rose of England, the thistle of Scotland, the golden harp and trefoil of Ireland, and the emblems of the several States of the American Union are familiar. In the Ashmolean Museum, Oxford, is an old and interesting badge, called King Alfred's Jewel. It is of gold, and was found in Athelney. See *Britannica*, Vol. XI, p. 709.

BADGER. See *Britannica*, Vol. III, p. 227. The American badger, *Taxidea americana*, very common in the West, differs from the European species chiefly in the dental formula. From this animal Wisconsin has been nick-named the Badger State.

BADGER, GEORGE PERCY, born in Chelmsford, England, in 1815. In 1840 he was ordained a clergyman of the Church of England. He is best known, however, for his attainments and public services as an Orientalist, and by numerous literary works on Eastern subjects.

BADGHIS, a country lying between the Harirod and the Murghab rivers, north of Herat and south of the boundary between the Russian territories and Afghanistan.

BADIN, STEPHEN THEODORE, born in Orleans, France, in 1768, died in Cincinnati, Ohio, in 1853. He came to the United States after having received a classical education in a Roman Catholic college, and was the first priest ordained in this country. After a time spent in Georgia College, where he perfected himself in the English language, he was appointed to missionary work in Kentucky. For years he labored alone in this field, suffering great hardships. Later he was sent to the Indians of Michigan, among whom he worked successfully.

BAD LANDS, known also by their French name, *Mauvaises Terres*, are various desolate tracts of land found in the western parts of the United States. The term is applied especially to an extensive barren region lying between the South Fork of the Cheyenne and the North Fork of the Platte, commonly known as the Dakota Bad Lands. This region is arid, broken, and utterly waste. It is of tertiary formation. Fossil bones of large animals are found in abundance. The broken surface of the Bad Lands has been described as resembling massive artificial structures decked out with all the accessories of buttress and turret, arched doorway, and clustered shaft, pinnacle and tapering spire. A little grass is found here and there in the rainy season; otherwise this desolate region affords neither vegetable nor animal life, nor mineral productions.

BADDEKER, KARL, born at Essen in 1801, died at Coblenz in 1859. He was a publisher of guide-books, after the style of Murray's *Hand-book*, which are now to be found in almost every European country. His description of the Rhine was his first guide-book.

BAER, VON, KARL ERNST, a Russian-German naturalist, born in Esthonia, 1792, died Nov. 29, 1876. He made discoveries in zoölogy and physiology, was the author of several works on animals, was professor of zoölogy at Königsberg and later was elected librarian of the Academy of Sciences in St. Petersburg. See *Britannica*, Vol. XXIV, p. 807; Vol. VIII, pp. 165, 749, 763; Vol. XVI, p. 839; Vol. XX, p. 421.

**BAFFA**, the *Paphos* of ancient times, a sea-port town on the southwest coast of the island of Cyprus. It has now fallen much into decay, and has but few inhabitants and a small trade in cotton, silk, and grain. Under Venetian rule it was a place of considerable importance.

**BAGAMOYO**, an African village which forms the starting-point for caravans going into the interior. It is situated on the eastern coast of Africa, opposite Zanzibar.

**BAGASSE**, **CANE STRAW**, or **CANE TRASH**, the refuse matter obtained during the expression of the saccharine juice from the sugar-cane.

**BAGEHOT**, **WALTER**, a distinguished English essayist and journalist, born at Langport in 1826, died in 1877. His principal productions are: *The English Constitution*; *Physics and Politics*; *Lombard Street*; and five volumes of essays on literature, biography, economics, and the depreciation of silver. At the time of his death he had been for seventeen years editor of the London "Economist." See *Britannica*, Vol. XIX, p. 396, *et seq.*; also Vol. VIII, p. 259.

**BAGGAGE**, a term applied in a general sense, in the United States, to the trunks, satchels, and similar receptacles, with their contents, which a traveler carries with him on a journey. In this sense in England, the word *luggage* is used. In law, such articles of apparel or ornament, and other small personal effects, as are of daily use for the convenience, comfort, or recreation of a traveler, including also small amounts of money used in defraying incidental expenses, but excluding merchandise, are protected as baggage. In military language, the clothes, provisions, utensils, and tents of an army are called its baggage.

**BAGHAL**, a Punjab hill-state in the northwest of India. Area, 124 square miles.

**BAGHERIA**, or **BAGARIA**, a town of Sicily, beautifully situated at the base of the isthmus which separates the Bay of Termini from that of Palermo. It is surrounded by groups of fine villas of the Sicilian nobility.

**BAGHULCUND**, or **REWAH**, the name given to five states of India lying south of the districts of Allahabad and Mirzapur, *Rewah*, *Nagode*, *Maihar*, *Sohawal*, and *Kothi*.

**BAGMOND'S ROLL**, so named from Bajimond, an Italian canon. It designates the valuation according to which the ecclesiastical benefices of Scotland were taxed from the end of the thirteenth century to the Reformation. See *Britannica*, Vol. I, p. 491.

**BAGNARA**, a town of Italy, situated on the Gulf of Gioia, about fifteen miles northeast of Reggio; it is noted for its excellent wine.

**BAGNES**, the convict prisons of France. In ancient times, the severest punishment, next to death, was that of the galleys. In 1748 these were abolished, and the convicts were employed at hard labor in arsenals and other public works, and the prisons in which they were lodged were called *bagues*, from the Italian *bagua*; literally a bath, a name supposed to have originated in the fact that the slave prisons at Constantinople contained baths, or because they stood near the baths of the seraglio. In these establishments the labor of the convicts is turned to profitable account, and the various handicrafts are taught in the prison under the direction of overseers. The industrious and clever are enabled to earn small wages, and good behavior is rewarded with a gradual relaxation of restraint.

**BAGNI DI LUCCA**, a town of Italy, in the valley of the Lima. It contains several medicinal thermal springs, and is a fashionable bathing place.

**BAGNO A RIPOLI**, a charming suburb of Florence, Italy. It contains many fine palaces and villas, and is much frequented for its baths.

**BAGNO IN ROMAGNO**, a town of Italy, near the source of the Savio. It is famed for its hot mineral springs containing natron.

**BAGOAS**, a Persian soldier who poisoned his king, Artaxerxes Ochus, and then made Darius Codomanus king. The latter ungratefully killed Bagoas about the year 336 B. C.

**BAGOT**, **SIR CHARLES** (1781-1843), an English diplomatist who was minister to France (1814), ambassador to St. Petersburg (1829), and to Holland (1824), and lastly, governor-general of Canada.

**BAGOT**, **LEWIS** (1740-1802), an English bishop who in 1777 was made dean of Christ Church, Oxford, after which he was successfully bishop of Bristol, Norwich, and St. Asaph's.

**BAGRADITES**, the royal family of Georgia and Armenia. Bagrad had the privilege of crowning the Armenian kings; in the eighth century one of his descendants became king of Georgia, and thus the Georgian Bagradites originated.

**BAGSHOT BEDS**, or **BAGSHOT SAND**, beds of sand with occasional layers of clay, brick-earth, or pebbles. These beds belong to the Eocene Tertiary age, are found on London clay, and have a maximum thickness of 1,200 feet.

**BAHAMAS**. See under **WEST INDIES**, *Britannica*, Vol. XXIV, pp. 509-512.

**BAHAR**, one of the old Mohammedan provinces of India, occupying part of the valley of the Ganges, and traversed by that river, lat. 21° 12' to 25° 21' N., long. 38° 25' to 86° 6' E., included in the British presidency of Bengal. The area of the province is 42,417 square miles. The name of Bahar was also given to one of the administrative districts, now officially called Gayah. Area of the district, 4,718 miles. Among the minerals the most important are coal and mica. The latter, nearly as pellucid as glass, is sometimes found in blocks, yielding plates 36 by 18 inches. Potatoes, cabbages, cauliflower, lettuce, turnips, etc., have been introduced from Europe and succeed well. Of indigenous productions the most considerable are rice, pulse, sugar, cotton, indigo, and tobacco. The district is largely engaged in manufacturing muslins, silks, carpets, blankets, tents, tapes, threads, ropes, paper, glass, cutlery, jewelry, leather, ink, soap, and pottery. Population, 19,736,101; being an average of 553 persons to the square mile.

**BAHIA HONDA**, a harbor on the north coast of Cuba, 60 miles west-southwest of Havana, protected by a fort, and formerly much resorted to by privateers and slavers.

**BAHR**, an Arabic word signifying a large body of water; it is applied both to lakes and rivers.

**BAHR**, **JOHANN CHRISTIAN FELIX**, an eminent German philologist and critic, born at Darmstadt in 1798, died in 1872. He was educated at Heidelberg, where he gained the favor and friendship of Crenzer, whose symbolic system of interpretation in mythological matters he himself pursued at a later period. He was elected a professor in 1826. Previously he had occupied himself chiefly with the elucidation and criticism of Plutarch, the result of which was annotated editions: *Alcibiades*, *Philopomen*, *Flamininus*, and *Pyrrhus*. One of his most important works is his version of Herodotus. In 1835 he published his *De Universitate Constantinopoli Quinto Saeculo Condita*.

**BAHRAICH**, a town of India, in a district of the same name. It is visited annually in May by thousands of pilgrims to the shrine of Masaud, a Mohammedan saint. See *Britannica*, Vol. XVIII, p. 72.

BAHR-EL-ABIAD ("white river"), Arabic name for the main branch of the Nile. Its sources, so far as known, are Lakes Victoria Nyanza and Albert Nyanza, under the equator. It flows in a northerly direction, and unites with the Blue Nile at Khartum. It is navigable for about 1,300 miles.

BAHR-EL-AYROCK ("blue river"), the second great branch of the Nile. It runs in a northward direction, uniting with the White Nile at Khartum; is a large, rapid stream and by its overflows contributes greatly to the fertility of Lower Egypt. In length it is about 900 miles, and during high water the river is navigable for 500 miles.

BAIL. See Britannica, Vol. III, p. 241. Historically, the word bail, from the old French *baillier*, bears the general sense of a delivery; and in law is used, primarily, of one who, by becoming surety for the future appearance of a prisoner at court, delivers him from present custody; and, secondarily, of the security given for the procurement of such delivery.

BAILEY, PHILIP JAMES, a distinguished poet, born at Basford, in the county of Nottingham, in 1816. His early education was conducted in his native town, and afterwards he became a student at the University of Glasgow. He was called to the English bar in 1840, but never practiced. The first edition of *Festus*, the poem by which he is best known, was published in 1839, and in subsequent editions received a large amount of new matter. It attracted considerable attention in England, and even more in America. It is a wonderful work, when the age of the author at the period of its production is taken into account. It was commenced before the author had reached his 20th year, and completed in three years. In 1867 appeared his *Universal Hymn*.

BAILEY, a wall, space or prison. See Britannica, Vol. II, p. 460.

BAILEY, JAMES MONTGOMERY, born in Albany, N. Y., Sept. 25, 1841. He received only a common school education and learned the carpenter's trade. He served in the civil war till its close. On his return he purchased the "Danbury Times" of Danbury, Conn., changing its name to "Danbury News." He acquired considerable renown for the short, humorous sketches which he published in this paper. Among his books are: *Life in Danbury, England, from a Back Window*, *They All Do It*, and *The Danbury Boom*.

BAILEY JOSEPH, a farmer of Salem, Ohio, born April 28, 1827, killed by desperadoes March 21, 1867. He entered the United States military service, and distinguished himself for the engineering skill displayed in building two dams across the Red River to deepen the water in the middle of the channel and thus enable the ships belonging to the Mississippi flotilla to pass over the rapids. The scheme was successfully carried out, and Colonel Bailey was made brigadier-general, and received the thanks of Congress.

BAILEY, THEODORE, born in Chauteaugay, N. Y., April 12, 1805, died in Washington, D. C., Feb. 10, 1877. He was a naval officer and twice circumnavigated the globe. When the Mexican war broke out, he conveyed an artillery company to California by way of Cape Horn. He took part in several expeditions, suppressed a riot in Panama, helped in restoring friendly feelings between the United States and the Fiji Islanders, and when the civil war broke out he commanded the frigate *Colorado*. He led in Farragut's attack on New Orleans, and was sent to demand the surrender of the city—a commission requiring great bravery. The navy yard at Portsmouth, N. H., was placed under his command from 1865 to 1867.

BAILIE, a Scotch term with several legal applications. It chiefly, however, and popularly, signifies a superior officer or magistrate of a municipal corporation in Scotland with judicial authority within a city or burgh.

BAILIFF, in English law, a legal officer who may be described as the keeper, protector, or superintendent of some duty or charge legally imposed upon him. The sheriff himself is the *Queen's bailiff*, and, as such, it is his business to preserve the rights of the crown within his bailiwick.

BAILIWICK, legally the county or district within which the sheriff's bailiffs may execute their office. Blackstone says that this word was introduced by the princes of the Norman line in imitation of the French, whose territory was divided into bailiwicks, as that of England into counties.

BAILLIE, LADY GRIZEL (1665-1746), a Scottish poetess, who wrote the song, *An' werrum my heart licht I wad dee*, and is gratefully remembered for her tender and heroic devotion to her father, Sir Patriek Hume, during his concealment in the vault of Polwarth Church.

BAILLIE, ROBERT, known as Baillie of Jarviswood, and often called "The Sidney of Scotland," born in Lanarkshire about the middle of the 17th century. He distinguished himself during the latter part of the reign of Charles II by his bold opposition to the tyrannical misgovernment of the Duke of Lauderdale. He was accused of conspiring against the king's life, and of being hostile to monarchical government, was tried at Edinburgh, and condemned to death upon evidence at once insignificant and illegal. The sentence was carried into execution in 1684.

BAILMENT, in law, the contract by which goods are delivered to another person without the surrendering of ownership, which goods are to be returned or accounted for at a specified time. The word also refers to the act of bailing or being surety for a person under arrest. The person making the delivery of property is called the bailor; the one to whom the property is delivered is the bailee.

BAILY'S BEADS, named from Francis Baily, who first fully described them. They are appearances seen at the limb of the moon at the moment of internal contact in a total solar eclipse. They resemble a row of brilliant beads, and are the result of diffraction and irradiation, being very much exaggerated when the telescope is out of focus or imperfect.

BAILYSTOK, a fortified town of Western Russia, in the government of Grodno, situated on the Baily. It is well built, the streets are bordered with lime trees, giving it a very pleasant aspect. It has a palace and park, a commodious market and several churches. It has manufactories of wootens, hats, leather, soap, tallow, etc. Population, 16,385.

BAIN, ALEXANDER, a Scotch metaphysical writer born at Aberdeen in 1818. He graduated at the University in that city in 1840. He occupied the chair of Natural Philosophy in the Andersonian University of Glasgow in 1845. He was appointed assistant secretary to the Metropolitan Sanitary Commission in 1847, and to the General Board of Health in 1850. The publication of *The Senses and the Intellect*, in 1855, and *The Emotions and the Will*, established his reputation as one of the profoundest investigators of psychological problems. His other important works include *Mental and Moral Science; Logic, Deductive and Inductive; Mind and Body—Theories of Their Relations; Education as a Science; English Grammar*, and *English Composition and Rhetoric*. He was appointed Regius Professor of Logic in the University of Aberdeen in 1860, and Lord

Rector of that University in 1881, and reelected in 1884. He was appointed Examiner in Logic in 1857, and Moral Philosophy in the University of London, and in 1858 was Examiner in Moral Science at the India Civil Service Examinations. See *Britannica*, Vols. I, p. 223; III, p. 534; VII, p. 648; XX, p. 13. He died in 1877.

**BAINBRIDGE**, the county-seat of Decatur county, Georgia, is on the Flint River at the head of navigation. Much cotton is shipped from here. It is a railroad junction. The village is small, but contains six churches, three academies, one bank and has a newspaper.

**BAINBRIDGE**, a small town of New York, situated in Chenango county, on the Susquehanna River and the Albany and Susquehanna Railroad. It has several churches, a foundry, printing office, and a handsome park.

**BAINBRIDGE**, WILLIAM, a distinguished American naval commander, born in Princeton, N. J., in 1774, died July 28, 1833. He became a captain in 1800. In the war against Tripoli, his vessel, the frigate *Philadelphia*, having run aground, he remained a prisoner from October, 1803, to June 1805. In 1812 he was put in command of the *Constitution*, the *Essex* and the *Hornet*. In December of that year he captured the British frigate *Jara*, mounting 49 guns.

**BAINES**, SIR EDWARD. See his father's biography, *Britannica*, Vol. III, p. 245. Sir Edward was born in Leeds in 1800, and died in 1880. He was for many years editor and principal proprietor of the "*Leeds Mercury*," and at the time of his death was believed to be the oldest journalist in Europe, having been connected with the press for seventy years. He represented Leeds in parliament from 1859 to 1874. He was a staunch Liberal, and was long known as an able temperance advocate and a strong non-conformist. He was knighted by the Queen in 1880.

**BAINS** (*i. e.* baths), the name of various watering places of France. Bains-les-Bains is one of these; it is situated 14 miles southwest of Epinal.

**BAINS**, the Latinized name of Michael de Bay, a theologian born in Hainault in 1513, died Dec. 16, 1589. He was professor of Divinity and later chancellor of Louvain University. Having adopted the doctrines of St. Augustine, he wrote on free-will and grace; but the pope, Pius V, condemned his work and the author retracted. Afterwards the Jansenists adopted and maintained his views.

**BAIRAKTAR**, grand vizier under Mahmud II, born in 1755, died Nov. 15, 1808. See *Britannica*, Vol. XXIII, p. 648, *et seq.*

**BAIRD**, HENRY CAREY, born at Bridesburg, Pa., in 1825. At the age of twenty he became a partner in the publishing house with which his name has been identified. He attained distinction as a writer and publisher of industrial and economic works.

**BAIRD**, JAMES, a Scotch philanthropist, born at Kirkwood in 1802, died in 1876. He amassed immense wealth as an iron-master. His blast furnaces employed at one time more than ten thousand men and boys. He endowed various schools, founded lectures, and spent vast sums of money in the mitigation of destitution among the people of his native land.

**BAIRD**, SPENCER FULLERTON, an eminent American naturalist and *littérateur*, born in 1823, at Reading, Pa., died in 1887. His first literary work of importance was a translation and revision of the *Iconographie Encyclopédique*. His writings on natural history were numerous and valuable. He was for many years secretary of the Smithsonian Institution. He was very prominently active in the work of the United States Commission of Fish and Fish-

eries. He was the recipient of many honors and medals from foreign societies and governments.

**BAIZE**, from the old French *bais*, a thick woolen fabric, with a long nap on one side, and usually of a plain red or green color. See *Britannica*, Vol. IX, p. 292.

**BAJMOK**, a large Hungarian village in the Baes province, 16 miles southwest of Theresienstadt.

**BAKALAHARI**, a Bechuana tribe of Africa inhabiting that portion of the Kalahari desert lying between the Orange River and Lake Ngami. They are partly civilized, and their occupations are agriculture and goat raising.

**BAKAN**, a town on the Bistrisza River in Roumania.

**BAKCHISERAI**, a town in a deep limestone valley in the Taurida, inhabited principally by descendants of the ancient Tartars. This place is noted as being the home of the early Crimean princes, whose ruined palace has been restored by the Russian government to its former splendor. The word comes from the Turkish, and means "Garden Palace."

**BAKE**, JAS., born at Leyden in 1787, died in 1864. He was professor of Greek and Roman literature in the University of Leyden from 1817 to 1857, and also a critical writer. He edited works by Cicero, Longinus and others.

**BAKSHISH**. The ordinary meaning of this word in Persian is a *present*; but in the East, in modern times, it has acquired the special signification of gratuity, which, however, the orientals do not quietly wait to receive, but demand loudly, even insolently. Every traveler, whether in Turkey or in Egypt, in Asia Minor or in Syria, if he receives the smallest service from anyone, is immediately reminded by the cry of, "Bakshish, Bakshish," to pay for the courtesy by a gift of money.

**BAJOCCO**, or *Bajocco*, was the name given to a piece of money, valued at about one cent. It was of copper and circulated throughout the Papal States.

**BAKER**, MORRIS, an eruptive volcano among the Cascades, situated in the northwest of Washington Territory, 20 miles from the boundary of Canada. It rises to a height of 11,100 feet.

**BAKER**, JOHN GILBERT, English botanist, born at Guisborough, Yorkshire, Jan. 13, 1834. See *Britannica*, Vol. XIX, p. 595.

**BAKER**, LAFAYETTE C., born at Stafford, Genesee county, N. Y., Oct. 13, 1826, and died in Philadelphia July 2, 1868. He was chief of the United States secret service, and in this capacity performed many brave acts. Colonel Baker organized the pursuit for the assassin of President Lincoln, and was present at Booth's capture and death. He was made brigadier-general. The *History of the United States Secret Service* was a book written by him, which throws light on the secret of the late war.

**BAKER**, SIR SAMUEL WHITE, an eminent explorer and author, born in London, England, in 1821. He first became known to the public by the establishment of a mountain colony in Ceylon, at Newera Ellia, in 1847, of which an interesting account is given in his *Eight Years' Wanderings in Ceylon*. In 1861 he organized at his own cost and conducted an expedition for the discovery of the sources of the Nile. In this expedition he was accompanied by his wife. Having reached the junction of the Atbara with the Nile, he explored the basin of the Blue Nile, and made his way to Khartum, where he organized a party to explore the course of the White Nile. He arrived at Gondokoro in the spring of 1863, where he met Captains Speke and Grant, who had started from Zanzibar on a similar quest, and reported having reached Victoria Nyanza, which they believed to be the source of the great river. Baker having assisted them to go on to

Khartum, resolved to follow up their discoveries, and without either interpreter or guide, and in face of many difficulties and dangers, set out from Gondokoro, and a year afterwards sighted the waters of a great lake, which he called the Albert Nyanza. The Royal Geographical Society awarded him the Victoria gold medal, and the Queen conferred upon him the honor of knighthood. He undertook a successful expedition into Central Africa on behalf of the Khedive in 1869, and in 1879 was sent by the British Government to investigate the resources of Cyprus. His *Wild Beasts and Their Ways* was published in 1890. See *Britannica*, Vol. I, p. 248; also Vol. XVII, p. 506.

BAKER, WILLIAM MUMFORD, an American clergyman and writer of fiction, born in Washington, D. C., in 1825, died in 1883. His principal work, *Inside: a Chronicle of Secession*, was published under the assumed name of "G. F. Harrington."

BAKEWELL, ROBERT, an English agriculturist, born about 1725, died in 1795. He is noted for his work in improving the breeds of cattle and sheep.

BAKHTEGAN, LAKE, a body of water in Persia, 60 miles long by 8 wide. It has no outlet. A salt marsh surrounds it, and large quantities of salt are obtained from the lake.

BAKONY WALD (Forest of Bakony), a densely wooded mountain range of Hungary, south of the Danube, dividing the great and little Hungarian plains. Immense herds of swine are annually driven hitherto to feed upon the mast of the forest.

BAKING POWDER, a substance composed of tartaric acid and bicarbonate of soda. All moisture having been carefully removed from these materials they are sifted together, and flour is added to dilute the strength. In baking bread, etc., baking powder is added to the flour to produce the escape of carbonic acid gas through the action of the water used in the mixture which raises the dough to its required lightness during the process of baking. As the properties contained in sour milk answer the purpose of tartaric acid, such milk is often used with bicarbonate of soda alone.

BAKUNIN, MICHAEL, born in Torschok, Russia, in 1814, died in Geneva in 1876. He was son of a rich family and enjoyed educational advantages at the military school of St. Petersburg, and later studied science in Berlin. He spent some time in Dresden, Paris, and Switzerland, at which last-named place he became acquainted with communistic and socialistic agitators. In 1847 he made a speech in Paris in favor of revolutionizing Russia. That government demanded his expulsion from the city, and after this he threw himself vigorously into all nihilistic movements in Europe. He is called the first nihilist. He was imprisoned, sentenced to death, exiled to Siberia, but escaped to Japan; then to the United States, and returned to London to resume his revolutionary work. He advocated the destruction of all things; belief in God we must get rid of; marriage and inheritance are to be abolished; conscience is to be regarded only as a matter of education. These doctrines are called "the very platform of the Russians conspiracy known as nihilism."

BALA BEDS, a local deposit, occurring in the neighborhood of Bala, in North Wales, and forming a group in the Lower Silurian of Murchison. They consist of a few beds, rarely more than 20 feet in thickness, chiefly composed of hard crystalline limestone, alternating with softer argillaceous bands, which decompose more freely, and leave the limestone like a cornice molding, affording a characteristic by which, at a considerable distance, the bala beds can be distinguished from the rocks of hard gritty slate above and below.

BALÉNICEP'S ("whale-headed"). A grallatorial bird of monstrous size, inhabiting the region of the Upper Nile. See *Britannica*, Vol. XXII, p. 577.

BALAGHAT, the name of a British district in the Central Provinces of India; also applied to an extensive tract of country extending between the rivers Krishna and Tumbuddra and the farthest extremity of Mysore in the south.

BALACHONG, a Chinese article of food, prepared from putrid shrimps or small fish pulverized with spices and salt, after which they are dried and eaten with rice.

BALAHISSAR, a village in Asia Minor, in the southwest of the Angora province. It was here that the ancient Pessinus was situated, and the modern village contains the ruins of beautiful buildings, many of which have crumbled away, leaving only their finely carved marble columns, etc. Among the ruins are a castle, a circus, a fairly well preserved theater, and the magnificent Temple of Cybele, this deity being the patron goddess of the ancient city.

BALAKLAVA, or BALACLAVA, a small port on the Black Sea, in the Crimea, Russia. The inhabitants are chiefly Greeks. The town was anciently quite magnificent, as is shown by the ruins of mosques, etc. Homer has correctly described the bay, and this is supposed to be the port of the Læstrigonians, where Ulysses landed. The place is now famed for having been the battle-ground in an action between the Russians and English, Oct. 25, 1854. Through the inefficiency of officials, British soldiers died of hunger and cold, while ships lying in the harbor were freighted with the necessary supplies.

BALANCE OF TRADE, the difference between the value of exports and imports in any country. When the value of the exports exceeds that of the imports, the balance of trade is said to be in favor of the country. A nation may be prosperous even when the value of its imports exceeds that of its exports.

BALANOGLLOSSUS, a genus of worm-like animal supposed to represent a distinct class of Enteropneusta (gut-breathers). They have the peculiarities of vertebrates and of invertebrates and are of four species. See *Britannica*, Vol. XXIV, pp. 179, 187.

BALANUS. See ACORN SHELLS, in these Revisions and Additions.

BALASINOR, a tributary Indian state in the Guzerat province of Bombay, in area about 156 square miles. Balasinor is the chief town, and is fifty-one miles to the north of Baroda.

BALATON, LAKE, the largest lake in Hungary. Length 51 miles, width seven miles, area about 382 square miles. The water is slightly salt; thirty streams flow into this body of water, whose outlets are the Sio and Sarviz, which empty into the Danube.

BALBI, GASPARO, a Venetian merchant of the 16th century. He was the first traveler who has left an account of India beyond the Ganges. Business often called him to Aleppo; and from thence, on one occasion, he made a visit to India, which lasted several years. After his return he published, in 1590, the result of his travels in a volume entitled *Viaggio all' Indie Orientali*.

BALBUENA, DE BERNARDO, a Spanish poet, only three of whose poems remain. He was born at Val-

BALÉNICEPS.

de-Peñas in 1568, and died at Porto Rico in 1627. He was bishop of the last-mentioned place. *La gran-  
den Mijicuna, El Siglo de Oro, and El Bernardo*  
are his works.

**BALBUS**, L. CORNELIUS, surnamed Major, born at Cadiz (Gades). He was a Roman officer who served under Cæsar in Spain in 61 B.C. He was chosen consul in 40 B.C.

**BALCONY** (It. *balcone*), a projecting gallery in front of a window or of several windows, with a balustrade or parapet before it and supported by consoles or brackets fixed in the wall, or by pillars resting on the ground below. The balcony was unknown in Greek and Roman architecture, and is probably an Italian contrivance, as the earliest examples of it occur in Italy, to the climate of which country it is peculiarly adapted.

BALCONY.

**BALD**, or **WHITE-HEADED EAGLE**, so called from the snow-white color of its neck and head. This bird is very large, being from seven to eight feet from tip to tip of its wings. Its food is fish, small animals, or any poultry it can get. This bird has been adopted as the national emblem of America.

**BALDACHIN** (It. *baldachino*), a tent-like or umbrella-shaped canopy, overshadowing the altars, chairs and portals of the early cathedrals, and sometimes placed above thrones, generally sustained by pillars. One of the most celebrated is in St. Peter's at Rome. The Romans in the time of Constantine suspended the sacramental vessel by a cord fastened to the center of the interior of this canopy, which from its cup-like appearance they called *ciboria*. The baldachin originated in Eastern countries, where there was still another form, a square-shaped structure, which was borne above the head of a priest, who carried the host, or above the heads of monarchs as significant of greatness. The employment of these structures in Anglican churches was in 1873 declared illegal, in consequence of a suggestion that one be used in the building of St. Barnabas' Church. The baldachin was introduced into Italy through the medium of the crusades. See *CIBORIUM*, *Britannica*, Vol. II, p. 462, and *UMBRELLA*, *Britannica*, Vol. XXIII, p. 723.

**BALDERIC**, or **BARDRY**, a French bishop and chronicler of the latter part of the 11th century. He endeavored to restore rigid monastic rule.

**BALDMONEY**, an umbelliferous plant used as a carminative medicine; it is also commonly applied to several kinds of gentian.

**BALDNESS**, an entire absence of hair from the head, sometimes hereditary, but more generally occurring from old age, or in consequence of disease, as fevers and skin diseases. See *Britannica*, Vol. XXII, p. 121.

**BALDPATE** (American widgeon, the *Marca Americana*), a duck found in Mexico, United States, Canada, South America, and sometimes in Europe. It has a white crown and its plumage is marked with red, brown, chestnut and white. This duck is much esteemed for the delicacy of its flesh.

AMERICAN WIDGEON.

**BALDRICK**, or **BARDRICK**, a band or sash worn partly as a military, and partly as a heraldic symbol. It

passes round the waist as a girdle, or over the left shoulder, and is brought down obliquely under the right arm, or is suspended from the right shoulder in such a way as to sustain a sword.

**BALDUNG**, HANS (Grün). See GRÜN HANS *BALDUNG*, *Britannica*, Vol. XI, p. 224.

**BALDWIN**, ABRAHAM, born in Guilford, Conn., Nov. 6, 1754, died in Washington, D. C., March 4, 1807. He graduated at Yale, was made chaplain in the army, studied law and was elected to the Georgia legislature; chosen delegate to the Continental Congress for three years, a member of the constitutional convention for four months, and a representative in Congress for eighteen years. He originated the idea of the Georgia University, and carried the scheme to a successful issue in the State legislature, and assisted a number of young men in obtaining an education.

**BALDWIN**, MATTHIAS WILLIAM, an American inventor and manufacturer, born at Elizabethtown, N. J., in 1795, died at Philadelphia in 1866. He made numerous and valuable improvements in locomotives, and perhaps constructed the first railway engine built in America.

**BALDWIN**, ROGER SHERMAN, born in New Haven, Conn., Jan. 4, 1793, died Feb. 19, 1863. He was an eminent jurist, and was associated with John Quincy Adams in conducting the famous Amistad captives case. He was successively assemblyman, senator and governor of his native State. In 1847 he went to the United States Senate. He was one of two electors "at large" for the choice of Abraham Lincoln, and his last public labors were performed at the "peace congress" of 1861, to which he was sent as a member.

**BALDWINSVILLE**, a village 12 miles north of Syracuse, situated in Onondaga county, N. Y., and on Seneca River. The Oswego and Syracuse Railroad passes through the place.

**BALEARIC CRANE**, a bird found in the northern and western parts of Africa. It is noted for its beautiful crown of golden feathers and its red cheeks. The plumage of its body is slate colored. It is about four feet high, has a short bill, is gentle and harmless and is quite easily tamed.

**BALECHOU**, JEAN JOSEPH NICOLAS, a noted French engraver, born at Arles in 1715, died Aug. 18, 1765. In style he was brilliant, but his drawings lack exactness and nice finish. His best works are *Storm Calm*, *Women Bathing*, *Saint Genievre*, and a full-length portrait of Augustus, King of Poland.

**BALEN**, (HENDRICK VAN (1560-1632), a Flemish painter, and Van Dyck's first teacher. He ranks high among the artists of his time, although his paintings are somewhat lacking in spirit. His works show taste and harmonious coloring.

**BALESTRA**, ANTONIO, an Italian painter of the Venetian school, born at Verona in 1666, died April 2, 1740. He was a good colorist and skillful designer. His best paintings are *Saint Theresa*, a *Virgin*, and his own portrait.

**BALFOUR**, ARTHUR, philosophical scholar and author of *Defense of Philosophic Doubt*. He was born in 1848. See *BRITANNICA*, Vol. XXI, p. 356.

**BALFOUR**, FRANCIS MAITLAND, brother of Arthur B., was born at Edinburgh in 1851, and on July 19, 1882, he perished in an attempt to ascend one of the spurs of Mont Blanc. He was a noted embryologist. See *BRITANNICA*, Vol. VIII, p. 169; Vol. XX, p. 418.

**BALFOUR**, JOHN HUTTON, M. D., F. R. S., born in Edinburgh, Sept. 15, 1808; died Feb. 12, 1881. He was professor of botany at Glasgow and afterwards in Edinburgh, and published a *Manual of Botany*, and a *Class Book of Botany* and the article on Botany in *BRITANNICA*, Vol. IV, pp. 79-163.

**BALFOUR**, REV. WALTER, born in Scotland, 1777, and died Jan. 3, 1852. He was brought up a Presbyterian, but became a Baptist and later a Universalist. He wrote several books, among which were *Inquiries Concerning the Devil*, *Scriptural Import of the Words Translated Hell*, and *The State of the Dead*.

**BALIOI**, or **BALLIOL**, EDWARD, a son of King John Balliol and heir to the Scottish throne. He was crowned at Scone in 1332, after an invasion of the country, but retained the throne only three months. He died in 1363. See *Britannica*, Vol. XXI, p. 489.

**BALISTA**, or **BALLISTA**, a weapon among the larger kinds of military engines in use before the

BALISTA.

invention of gunpowder. The ballista, which was in the form of a cross-bow, propelled large and heavy missiles, chiefly through the reaction of a tightly twisted rope of hemp, flax, cat-gut, sinew or hair, or else by a violent movement of levers. It required

a good deal of mechanism to bring about the propulsive force. The makers of the machine were very particular in the choice of women's hair, the sinews of a bull's neck, and the tendons of the deer, for fastening the elastic cord. The early chroniclers tell of a ballista which threw a stone weighing 360 pounds.

**BALISTES**, a genus of fishes. See *FILE-FISH*, *Britannica*, Vol. IX, p. 161.

**BALIZE**, or **BELIZE**, a British colony on the Bay of Honduras, in the Caribbean Sea, extending in N. lat. from 16° 45' to 18° 30', and W. long. from 88° 10' to 89°, forming the southeast part of the peninsula of Yucatan. Its area is about 9,000 square miles. Population, about 30,000.

**BALKASH** ("large lake"), a lake of Asiatic Russia, having no visible outlet. Its length is 390 miles, and its greatest breadth 50 miles.

**BALL**, SIR ROBERT STAWELL, LL.D., F. R. S., born in Dublin, July 1, 1840. He studied at Trinity College, Dublin, and in 1855 Lord Rosse engaged him as his astronomer at Parsonstown. He became Professor of Applied Mathematics and Mechanics at the Royal Irish College of Science in 1873; the following year he was made astronomer royal for Ireland and Andrews professor of astronomy at Dublin University. He was knighted in 1886. He is well known as a lecturer and writer.

**BALL**, THOMAS, an eminent American sculptor, born at Charlestown, Mass., in 1819. His most esteemed works of art are statues of Washington, Webster and Everett, and busts of Choate and Webster.

**BALLABGAHR**, an Indian town situated in the Punjab in the native state of Ballabahr, of which it was once the capital. It carries on a food-grain trade and has several temples and a palace.

**BALLACHULISH**, a village of Scotland, 16½ miles south of Fort William, in Argyllshire, on the southern shore of the salt-water lake of Leven, noted for its extensive quarries of blue clay-slate, which have been worked since 1760, and give employment to nearly 600 men. The product of these quarries now averages annually about 17,000,000 roofing-slates, weighing some 30,000 tons. Population, about 1,000.

**BALLADE**, a French style of poem composed of one or more terms, or triplets, of stanzas, each of

which contained seven or eight lines. It usually ended with an envoy, and each stanza with the same line as refrain. The term is now often applied to poetry, divided into stanzas of the same length. See *Britannica*, Vol. IX, p. 644.

**BALLANTINE**, JAMES, poet and artist, born at Edinburgh in 1808, died in 1877. He learned the trade of a house painter, but studied drawing under Sir William Allen and turned his attention to staining glass, taking a prominent part in the revival of that art, and was employed to furnish the House of Lords with windows. His work on *Glass Staining*, published in 1845, was translated into German. Among his works are *One Hundred Songs, with Music* (1865), *Life of David Roberts, R. A.* (1866), *Lilies Lee* (1871), and numerous poems written from 1856 to 1865; he also wrote two volumes in prose, *The Gabertunzie's W'allet* (1843), and *Miller of Deanhaugh*, in which are contained some of his best-known songs and ballads.

**BALLANTINE**, WILLIAM (1812-1886). He was an able sergeant-at-law, and for some years filled the office of magistrate at the Thames police court. He was mainly employed in criminal cases, the most important being the Tichborne case, the defense of the Guicowar of Baroda, and the Muller murder trial. He wrote *Experiences of a Barrister's Life* (1882), and an account of his voyage to America, called *The Old World and the New* (1884).

**BALLANTRAE**, a Scotch fishing-village in the southern part of Ayrshire, at the mouth of the Stinchar. It has considerable occupation in fish-curing, and carries on the chief trade of the south-west fishery district.

**BALLANTYNE**, JAMES (1772-1883), and JOHN, his brother (1774-1821), Scotch printers employed by Scott in the publishing of his works. Scott afterwards secretly joined them in their business, and chiefly through his mismanagement they were at length bankrupt. See *Britannica*, Vol. XXI, p. 548.

**BALLANTYNE**, ROBERT M., a Scotch author, born at Edinburgh in 1825. His stories, which were generally founded on facts taken from his own experience and adapted for boys, were sound, sensible and popular. He began his literary career in 1856, writing tales concerning incidents that took place during his residence among the Red Indians and fur traders in the forests of Rupert's Land. He had published his first work, however, in 1843, an account of his six years' experience in the territories of the Hudson Bay Company (1841-1847). In 1887 he had issued 74 volumes, of which 62 were separate tales.

**BALLAST**, a heavy substance employed to give a ship sufficient hold of the water to insure her safe sailing with spread canvas when her cargo and equipment are too light. The term ballast is also employed by civil engineers to signify the sand or gravelly material which is held as a packing between railway sleepers in order to give them solidity.

**BALLENY ISLANDS**, a group of five small volcanic islands in the Antarctic Ocean. Lat. 66° 44' S. Long. 163° 11' E.

**BALL-FLOWER**, an ornament peculiar to the decorated style of Gothic architecture which prevailed in the 14th century. The ball-flower, so named from its resembling a ball placed in a circular flower,

BALLOON-FISH.

is supposed by some to be an imitation of a pomegranate, by others of a hawk's bill.

**BALLINROBE**, a small town on the Robe River, in the County of Mayo, Ireland. It is situated 17 miles from Castlebar. See *Britannica*, Vol. XV, p. 450.

**BALLASTIC PENDULUM**, an instrument invented by Benjamin Robins in the latter part of the last century, to ascertain the velocity of projectiles, and to prove the quality of gunpowder. See

*GUNNERY*. *Britannica*, Vol. XI, p. 297.

**BALLOON-FISH**, the families of *Tetraodontidae*, *Diodontidae* and *Triodontidae*. Several species are found in America; they are so called from their power to inflate themselves with air. The sea-hedgehog.

DIODON.

**BALLOT SYSTEM, AUSTRALIAN.** For ballot and other methods of voting in various countries, see *Britannica*, Vol. III, pp. 288-92. The "Australian ballot system," now exciting large attention in the United States, where it was adopted by many of the States in 1889 and 1890, seems to have been first suggested by the Hon. Francis S. Dutton, member of the legislature of South Australia from 1851 to 1865, and twice during that period at the head of the government. He first proposed it in the legislature of 1851. No law under the proposed system was adopted by the legislature until the session of 1857-58, when a modified plan was enacted under the name of the "elections bill." Its results gave immediate satisfaction, and everywhere the new machinery was declared to "work with the greatest smoothness, ease and economy." The whole aspect of the election was said to have completely changed. "Rioting and disorder disappeared completely, and the day of election became a day of quietness—so much so that a stranger would not recognize the presence of any unusual interest." By the Ballot Act of 1862, its essential principles were applied to all elections other than to the legislative council and the assembly. In 1876 the system was made to cover the election to district councils, and in 1887 was applied to rural government also; so that the system extended to all elections in the colony of South Australia.

In the colony of Victoria the system was adopted for parliamentary elections soon after its introduction into South Australia; in 1861 it was applied to county and municipal elections. The system was adopted for parliamentary elections in Tasmania in 1858, and later for all other elections. New South Wales adopted it the same year.

The Australian ballot system was introduced into the Dominion of Canada as follows: It was adopted by British Columbia, February, 1873 (Ballot Act 36 Vict.); by the Ontario legislature in 1874 (Ballot Act 37 Vict.); by the Dominion parliament, 1874 (Dominion Elections Act 37 Vict.); by the legislature of Quebec, 1875; by the general assembly of Nova Scotia, 1875 (Statutes 1875, chap. 26); by the Northwest Territories, 1885 (by the Lieut. Gov. in Council); and by the Manitoba assembly, 1886 (Elections Act 1886, chap. 25). At later dates application of the system was made to cover the municipal as well as the legislative elections in the several provinces of the Dominion.

On the European continent Belgium was the first to introduce the system. This, after numerous unsuccessful attempts, was effectively done on July 9, 1877. The English electoral acts were adopted with various important modifications. In 1879 the Grand Duchy of Luxembourg adopted the Belgian method almost in its entirety. In Italy the various reforms relating to the secret ballot, as adopted by the other European nations, which had followed the Australian lead, were consolidated in the acts

of Jan. 22 and May 7, 1882, and were formally announced by royal decree of Sept. 14, 1882. In order to render the law more certain of enforcement, a reading and writing qualification on the part of the voter was imposed by the consolidated act of 1882.

In the United States the earliest practical efforts in the direction of legislative action were put forth in Michigan in 1855, when a bill embodying the Australian system was introduced by Mr. Geo. W. Walthew, of Lansing. The bill failed of a majority; but in 1857 the bill in a revised form was again presented and passed the House, but failed in the Senate. In Kentucky a bill embodying the system in part, but applying only to the municipal elections of the city of Louisville, was drafted by Arthur M. Wallace, of that city, and was enacted by the legislature Feb. 25, 1858, with only one dissenting vote. In New York the system was embodied in a bill known as the Saxton bill, and passed both houses of the legislature in 1858, and after some modification was again passed in 1859, but in both cases it was vetoed by the Governor. Early in 1890 the bill was further changed, to meet the Governor's objections, and then again passed and became a law, and under its provisions the November elections throughout the State were held. In Massachusetts the first legislation in favor of the system dates from May 30, 1858, when the Governor approved a bill embodying the leading features of the reform method. In 1859 the example of Massachusetts was followed by the legislatures of other States in the following order: Indiana, Rhode Island, Wisconsin, Tennessee, Minnesota, Missouri, Michigan, and Connecticut. In 1890 the adoption of the general system took place in other States, as follows: Washington, New York, Maryland, and Vermont.

It will be seen by the preceding epitomized chronological outline that South Australia was the pioneer in the introduction of the notable Ballot Reform system, now engaging public attention in so many countries, and in many of the States of our own national federation. Upon the electoral law of that province, perfected substantially in 1879, the ballot laws of many other countries are based, with the introduction of such modifications in various details as have been regarded as desirable to adapt it to the differing conditions of those countries and states. That Electoral Law (42, 43 Vict., No. 141) embraced 106 sections. We quote below only those portions of the full text which are needed to give the reader a clear exhibit of the voting system. The first 45 sections, relating mainly to the appointment of officers and registration, we omit:

46, 47. (Form of election-writ: the polling-day to be not less than two and not more than thirty days from the day of nomination.)

48. In order that any person may become or be a candidate at any election, he shall be nominated by not less than two persons entitled to vote at such election, in manner follow-

ing, that is to say. After the issue of the writ and before the time fixed for the nomination, there shall be delivered to the returning officer a nomination paper, in the form, or to the effect of the form in the Tenth Schedule hereto, naming such person as a candidate at such election, and signed by the persons nominating as aforesaid, and having at the foot thereof a statement, under the hand of the person so nominated, that he consents to act if elected.

49. (Publication by returning officer of dates of nomination and election and of polling-places.)

50. The returning officer shall at noon, on the day of nomination, attend at the chief polling place, and there publicly produce the several nomination papers he shall have then received, and give notice of the names of the persons nominated.

51. In case there shall be no greater number of candidates duly nominated than are required to be elected, the returning officer shall declare such candidate or candidates to be elected, and make his return accordingly.

52. In case more such candidates shall be duly nominated, the returning officer shall give notice thereof of the names of the candidates, and of the day and time of taking the poll.

53. (Polling-booths to be provided, and poll-clerks and door-keepers to be appointed.)

54. Each polling-booth shall have separate compartments, and shall be provided with a ballot-box having an inner cover, with a cleft therein, for receiving the voting papers, and a lock and key, and an outer cover with a lock and key; and the said compartments shall be constructed so as to screen any voter therein from observation, and shall be furnished with pencils for the use of voters.

55. The returning officer shall cause voting papers to be printed which shall contain the Christian and surnames of the several candidates arranged in alphabetical order according to such surnames; and if there are two candidates of the same surname, then according to the Christian name of such candidates; and if there are two candidates of the same Christian name and surname, then according to the residences of such candidates, arranged in the like order, and a square printed opposite the name of each candidate and he shall obtain a sufficient number of voting papers.

56. Before the hour of polling the returning officer shall deliver to the substitutes at each polling-booth a list of the electors on the said roll who have been registered for six months, and who claim to vote at such polling-booth, herein called "list of voters," together with a copy or copies of the roll in force for the division or district, as the case may be, for use at the said polling, and shall sign each page of such list; and shall also deliver to each substitute, and himself retain such numbers respectively of the voting papers as shall be sufficient for the use of the electors at such booth.

57. Before delivering the voting papers to the electors, each returning officer, or his substitute, shall initial such papers on the face thereof, and fold them, and keep an exact account of all initialled voting papers.

58. On the day of election the poll shall be taken at the several polling-places according to the following regulations:—

(1.) (Hours of opening; care of the ballot-box.)

(2.) (Hours of closing.)

(3.) Every person proposing to vote shall state to the presiding officer, or to some of his clerks, his Christian name and surname, and if so required any other of the particulars, necessary to be expressed in the roll, which the said officer may require for the sole purpose of enabling him to ascertain the name upon the roll intended by such person.

(4.) The presiding officer or voting clerk shall ascertain if the name intended by the voter is upon the list of voters; and if so found he shall, subject as hereafter provided, deliver to such voter a voting paper bearing the initials of the returning officer, or his substitute, and shall place a mark against the voter's name on the list of voters.

(5.) If a person representing himself to be a particular elector named on the rolls applies for a voting paper after another person has voted as such elector, the applicant shall, upon duly answering the questions in the Eleventh Schedule, be entitled to receive a voting paper in the same manner as any other voter.

(6.) The voter shall forthwith retire alone to some unoccupied compartment of the said booth, and shall there in private and without delay indicate the name of each candidate for whom he intends to vote by making a cross, the center of which cross shall be contained within the square opposite the name of such candidate, and shall then fold the voting paper, and immediately deliver it so folded to the presiding officer, who shall openly forthwith, and without unfolding the same, deposit it in the ballot-box; and the voter shall then quit the polling-booth.

(7.) Any voter may signify to the presiding officer that by reason of blindness he is unable to comply with the last preceding regulation; and thereupon the presiding officer, if satisfied that such voter is afflicted with blindness, shall permit any agent named by such voter to accompany him into the compartment set apart for the purpose, to mark the voting paper on such voter's behalf, and hand the same to the returning officer, who shall deposit the same in the ballot-box.

(8.) Any person who, by mistake or accident, shall spoil any voting paper, may, before the same shall have been deposited in the ballot-box, upon signifying the same to the returning officer and delivering up the spoiled voting paper, obtain a fresh voting paper; and the spoiled voting paper shall be then and there destroyed by burning the same.

(9.) (Provision for closing and sealing the ballot-box.)

59. The returning officer (or his substitute), the poll clerks, and door-keepers and scrutineers (not exceeding two for each candidate, to be appointed in writing), and electors about to vote, shall alone be permitted at any one time, without the consent of the returning officer or his substitute, to enter or remain in the polling-booth during the taking of the poll.

60. (Questions to voters as to qualifications, etc.)

61. If the person so proposing to vote shall refuse to answer any question or shall answer the same in such manner as to show that he is not qualified to vote, he shall not be permitted to vote, and he shall forthwith return to the presiding officer the voting paper, if any, delivered to him, and which paper shall thereupon be immediately destroyed by the said presiding officer.

62. (Ballot-boxes to be delivered to the respective returning officers.)

63. All voting papers issued to any substitute, and not used by him, and all lists of voters, shall be returned by him to the returning officer, with the ballot-box.

64. (Proceedings relative to the counting of the voting papers.)

The returning officer shall reject all voting papers not initialled, or which shall contain crosses against the names of a larger number of candidates than are required to be elected, or shall contain anything marked or written other than the initials of the returning officer or his substitute, and the cross indicating the name of such candidate for whom the elector intends to vote.

67. The returning officer of the district shall send to the returning officer of the province, a return, in a tabular form, of the number of electors on the roll, the number of voting papers found in the ballot-boxes, the number of voting papers allowed, the number of voting papers rejected, distinguishing the number, 1st, not initialled by the returning officer or his substitute; 2d, voting for more candidates than entitled to be elected; 3d, containing writing or marks by which the voter can be identified; 4th, unmarked or informally marked voting papers.

71. No election shall be held to be void in consequence solely of . . . any error on the part of any returning officer or deputy, which shall not affect the result of the election, or of any error or impediment of a mere formal nature.

72. Every person who—

(1.) Forges or fraudulently defaces or fraudulently destroys any nomination paper, or delivers to the returning officer any nomination paper, knowing the same to be forged; or

(2.) Forges or counterfeits or fraudulently defaces, or fraudulently destroys any voting paper or the initials on any voting paper; or

(3.) Without due authority supplies any voting paper to any person; or

(4.) Fraudulently puts into any ballot-box any paper other than the voting paper which he is authorized by law to put in; or

(5.) Fraudulently takes out of the polling-booth any voting paper; or

(6.) Without due authority destroys, takes, opens, or otherwise interferes with any ballot-box or voting papers then in use for the purposes of the election; or

(7.) Refuses to deliver to the returning officer or his substitute any voting paper in his possession, whether he shall have obtained such voting paper for the purpose of recording his vote or not.

Shall be guilty of a misdemeanor, and be liable, if he is a returning officer, or an officer or clerk in attendance at a polling-booth, to imprisonment for any term not exceeding two years, with or without hard labor; and, if he is any other person, to imprisonment for any term not exceeding six months, with or without hard labor; and any attempt to commit any offense specified in this section shall be punishable in the manner in which the offense itself is punishable.

73. In any indictment or other prosecution for an offense in relation to the nomination papers, ballot-boxes, and voting papers at an election, the property in such papers and boxes may be stated to be in the returning officer at such election.

85. If any returning officer for the said province, or any district returning officer, after having accepted office as such, shall neglect or refuse to perform any of the duties which by the provisions hereof he is required to perform, every such returning officer or district returning officer shall, for every such offense, forfeit any sum not less than ten nor exceeding two hundred pounds; and in like manner if any substitute, clerk, or other officer or person appointed or required to perform any duty, under or by virtue of this act, shall neglect or refuse to perform any of the duties which by the provisions hereof he is required to perform, every such clerk or other officer or person shall, for every such offense, forfeit and pay any sum not less than five and not exceeding fifty pounds.

(Sections 87-100: Related to the Court for the trial of "Disputed Returns.")

101. When any matter or thing is hereby directed to be performed on a certain day, and that day shall happen to be Sunday, Good Friday, Christmas Day, or other public holiday, the said matter or thing may be performed on the next succeeding day, not being any of the days aforesaid.

(Sections 102-106 relate to general involving local questions.)

MODEL OF POLLING ROOM PROVIDED FOR BY THE MASSACHUSETTS ACT, and copied from a sample Massachusetts ballot of November, 1890, giving full instructions to the voter as to the method of filling up and depositing his ballot.

In most cases in the United States the adoption of the new ballot system was largely due to the precedent energetic work performed by the Civil Service or Ballot Reform Associations organized in the various States. The Rhode Island Ballot Reform Association, in a well-written paper advocating the adoption of the Australian system, closed its urgent arguments by tersely summarizing the advantages of the system, as follows:

1. A secret ballot, cast as proposed in this plan, interposes the most effectual preventative of the bribery of the voter ever devised.

2. A secret ballot secures the voter against the coercion or undue solicitation of others, and enables the most dependent elector to vote as his conscience dictates, in perfect freedom.

3. Expense for assessments of candidates is taken away. A poor man is placed on an equality with a rich man as a candidate. Money will be less of a factor in politics.

4. The voter will be "alone with his country, his conscience, and his God," and elections will be more than ever the intelligent and conscientious registering of the popular will.

5. This method of ballot reform has been much discussed in the United States for several years, and has received general favor, being recognized, after careful scrutiny, as a practical and salutary measure.

AUSTRALIAN BALLOT SYSTEM, as adopted by the legislature of Massachusetts in 1888 and 1889. The law was entitled "an Act to provide for printing and distributing ballots at the public expense, and to regulate voting at State and city elections":

SECTION 1. All ballots cast in elections for national, State, district, and county officers in cities and towns after the first day of November in the year eighteen hundred and eighty-nine, and all ballots cast in municipal elections in cities after that date, shall be printed and distributed at public expense, as hereinafter provided. The printing of the ballots and cards of instructions to voters shall in municipal elections in cities be paid for by the several cities respectively, and in all other elections the printing of ballots and cards of instruction, and the delivery of them to the several cities and towns, shall be paid for by the Commonwealth. The distribution of the ballots to the voters shall be paid for by the cities and towns respectively. The term "State election," as used in this act, shall apply to any election held for the choice of a national, State, district, or county officer, whether for a full term or for the filling of a vacancy, and the term "State officer" shall apply to any person to be chosen by the qualified voters at such an election. The term "city election" shall apply to any municipal election so held in a city, and the term "city officer" shall apply to any person to be chosen by the qualified voters at such an election.

#### NOMINATIONS OF CANDIDATES.

2. Any convention of delegates, and any caucus or meeting of qualified voters, as hereinafter defined, and individual voters to the number and in the manner hereinafter

specified, may nominate candidates for public office, whose names shall be placed upon the ballots to be furnished as herein provided.

3. Any convention of delegates representing a political party which, at the election next preceding, polled at least three per cent of the entire vote cast in the State, or in the electoral district or division thereof for which the nomination is made, or any convention of delegates who have been selected in caucuses called and held in accordance with a special statute providing therefor, and any caucuses so called and held in any such electoral district or division, may for the State or for the district or division for which the convention or caucus is held, as the case may be, by causing a certificate of nomination to be duly filed, make one such nomination for each office therein to be filled at the election. Every such certificate of nomination shall state such facts as may be required as above for its acceptance, and as are required in section five of this act; shall be signed by the presiding officer and by the secretary of the convention or caucus, who shall add thereto their places of residence; and shall be sworn by them to be true to the best of their knowledge and belief, and a certificate of the oath shall be annexed to the certificate of nomination.

4. Nominations of candidates for any offices to be filled by the voters of the State at large may be made by nomination papers signed in the aggregate for each candidate by not less than one thousand qualified voters of the State. Nominations of candidates for electoral districts or divisions of the State may be made by nomination papers signed in the aggregate for each candidate by qualified voters of such district or division, not less in number than one for every one hundred persons who voted at the next preceding annual election in such district or division, but in no case less than fifty. In the case of a first election to be held in a town or ward newly established, the number of fifty shall be sufficient for the nomination of a candidate who is to be voted for only in such town or ward; and in the case of a first election in a district or division newly established, other than a town or ward, the number of fifty shall be so sufficient. Each voter signing a nomination paper shall add to his signature his place of residence, with the street and number thereof, if any, and each voter may subscribe to one nomination for each office to be filled, and no more. Women qualified to vote for members of the school committee may sign nomination papers for candidates for the school committee. The nomination papers shall before being filed be respectively submitted to the registrars of voters of the cities or towns in which the signers purport to be qualified voters, and each registrar to whom the same is submitted shall forthwith certify thereon what number of the signatures are names of qualified voters, both in the city or town for which he is a registrar, and in the district or division for which the nomination is made; one of the signers to each such separate paper shall swear that the statements therein are true, to the best of his knowledge and belief, and the certificate of such oath shall be annexed, and he shall also add his post-office address.

5. All certificates of nomination and nomination papers shall, besides containing the names of candidates, specify as to each, (1) the office for which he is nominated; (2) the party or political principle which he represents, expressed in not more than three words; (3) his place of residence, and, in case of a nomination for a city office, with street and number thereon, if any. In the case of electors of president and vice-president of the United States, the names of the candidates for president and vice-president may be added to the party or political appellation.

6. Certificates of nomination and nomination papers for the nomination of candidates for State offices shall be filed with the secretary of the Commonwealth at least fourteen days previous to the day of the election for which the candidates are nominated. Such certificates and papers for the nomination of candidates for the offices of mayor and of aldermen in cities shall be filed with the city clerks of the respective cities at least ten days previous to the day of such election, and for the nomination of candidates for all other city offices at least six days previous to the day of such election.

7. The certificates of nomination and nomination papers being so filed, and being in apparent conformity with the provisions of this act, shall be deemed to be valid, unless objection thereto is duly made in writing. Such objections or other questions arising in relation thereto in the case of nominations of State officers shall be considered by the secretary of the Commonwealth and the auditor and attorney-general, and the decision of the majority of these officers shall be final. Such objections or questions arising in the case of nominations of city officers shall be considered by the board of registrars of voters, together with the city clerk, if not a member of such board, and the city solicitor; and the decision of a majority of these officers shall be final. In case such objection is made notice shall forthwith be mailed to the candidates affected thereby, addressed to their residences as given in the certificates of nomination or nomination papers, and to any party committee known to the secretary or clerk, as the case may be, as specially interested in the nomination. It shall be proper for the officers above named, in the decision of any question as to the proper political or party designation of candidates, to distinguish between candidates nominated by certificates of nomination, and those nominated by nomination papers.

8. Any person whose name has been presented as a candidate may cause his name to be withdrawn from nomination, by request in writing signed by him and acknowledged before an officer qualified to take acknowledgments of deeds, and filed with the secretary of the Commonwealth ten days, or with the proper city clerk five days, as the case may be, previous to the day of election; and no name so withdrawn shall be printed upon the ballots. No nomination published and posted as herein provided shall be subsequently omitted as invalid.

9. All certificates of nomination and nomination papers when filed shall be open under proper regulations to public inspection, and the secretary of the Commonwealth and the several city clerks shall preserve the same in their respective offices not less than five years.

#### FORM OF BALLOTS.

10. All ballots for use in State elections shall be prepared by the secretary of the Commonwealth, and all ballots for use in city elections shall be prepared by the clerks of the several cities respectively. Every general ballot, or ballot intended for the use of all male voters, which shall be printed in accordance with the provisions of this act, shall contain the names of all candidates whose nominations for any offices specified in the ballot have been duly made and not withdrawn in accordance herewith, and shall contain no other names. Except that in the case of electors of president and vice-president of the United States the names of the candidates for president and vice-president may be added to the party or political designation; the name of the city or town in which the candidate resides shall be added to the name of each candidate on ballots for State offices; and the street, with street number, if any, on which a candidate resides, shall be added to the name of each candidate on ballots for city offices; and there shall also be added to all the names of candidates their party or political designation. The names of candidates for each office shall be arranged under the designation of the office in alphabetical order, according to surnames, except that the names of candidates for the offices of electors of president and vice-president shall be arranged in groups, as presented in the several certificates of nomination or nomination papers. There shall be left at the end of the list of candidates for each different office as many blank spaces as there are persons to be elected to such office, in which the voter may insert the name of any person, not printed on the ballot, for whom he desires to vote as candidate for such office. Whenever the approval of a constitutional amendment or other question is submitted to the vote of the people, such questions shall be printed upon the ballot after the list of candidates. Special ballots in cities, containing only the names of candidates for the school committee, shall also be prepared in like manner and printed for the use of women qualified according to law to vote for members of the school committee. The ballots shall be so printed as to give to each voter a clear opportunity to designate by a cross-mark [X] in a sufficient margin at the right of the name of each candidate, his choice of candidates and his answer to the questions submitted, and on the ballot may be printed such words as will aid the voter to do this, as "vote for one," "vote for three," "yes," "no," and the like. The ballot shall be substantially of the length now required by law and two or more times such width. Before distribution the ballots shall be so folded in marked crosses that their width and length when folded shall be those of the ballot now required by law. On the back and outside when folded, shall be printed "Official Ballot for," followed by the designation of the polling-place for which the ballot is prepared, the date of the election, and a fac-simile of the signature of the secretary of the Commonwealth or city clerk who has caused the ballot to be printed. The special ballots printed in cities for the use of women qualified to vote for school committee shall contain the additional indorsement that they are for such use only, and shall be on tinted paper, but of a different tint from that of specimen ballots. Except as otherwise herein provided, ballots shall be printed in accordance with the existing provisions of law.

11. All ballots when printed shall be folded as hereinbefore provided and fastened together in convenient numbers in packages, books or blocks, in such manner that each ballot may be detached and removed separately. A record of the number of ballots printed and furnished to each polling-place shall be kept and preserved by the secretary of the Commonwealth and the several city clerks.

12. There shall be provided for each voting place, at which an election is to be held, two sets of such general ballots, each of not less than one hundred for every fifty and fraction of fifty registered male voters therein, and likewise two sets of such special ballots, each of not less than one hundred, for every fifty and fraction of fifty women qualified to vote for school committee therein; and it shall be the duty of the registrars of voters in each city or town in which an election for State officers is to be held, to certify to the secretary of the Commonwealth, at such time as he shall require previous to any such election, the number of male registered voters in each voting precinct or in each town which is not divided into voting precincts.

#### INFORMATION TO VOTERS.

13. The secretary of the Commonwealth, in case of a State election, and the several city clerks, in case of city elections,

shall prepare full instructions for the guidance of voters at such elections, as to obtaining ballots, as to the manner of marking them, and the method of gaining assistance, and as to obtaining new ballots in place of those accidentally spoiled, and they shall respectively cause the same, together with copies of sections twenty-seven, twenty-eight, twenty-nine, and thirty of this act to be printed in large, clear type, on separate cards, to be called cards of instructions; and they shall respectively furnish the same and the ballots for use in each such election. They shall also cause to be printed on tinted paper, and without the fac-simile indorsements, ten or more copies of the form of the ballot provided for each voting place at each election therein, which shall be called specimen ballots, and shall be furnished with the other ballots provided for each such voting place.

14. The secretary of the Commonwealth shall, five days at least previous to the day of any election of State officers, transmit to the registrars of voters in each city and town in which such election is to be held, printed lists containing the names, residences, and party or political appellations of all candidates nominated as herein provided for such election, and to be voted for at each polling place in each such city and town respectively, substantially in the form of the general ballot to be so used therein; and the registrars of voters shall immediately cause the lists for each town or voting precinct, as the case may be, to be conspicuously posted in one or more public places in such town or voting precinct. The secretary of the Commonwealth shall likewise cause to be published prior to the day of any such election, in at least two newspapers, if there be so many, published in each county, representing, as far as practicable, the political parties which, at the preceding election, cast the largest and next largest number of votes, a list of all the nominations made as herein provided, and to be voted for in such county, so far as may be, in the form in which they shall appear upon the general ballots.

15. The city clerk of each city shall four days at least prior to the day of any city election therein, cause to be conspicuously posted in one or more public places in each voting precinct of such city a printed list containing the names, residences, and party or political appellations of all candidates nominated, as herein provided, and to be voted for in such precinct, substantially in the form of the general ballot to be so used therein; and he shall likewise cause to be published prior to the day of such election in at least two newspapers, if there be so many, published in such city, representing the political parties which cast at the preceding election the largest and next largest number of votes, a list of all the nominations made, as herein provided, and to be voted for in such city, so far as may be, in the form in which they shall appear upon the general ballots.

#### DELIVERY OF BALLOTS TO CITIES AND TOWNS.

16. The secretary of the Commonwealth shall send, separately and at different times or by different methods, the two sets of general and special ballots, together with the specimen ballots and cards of instruction printed by him, as herein provided, to the several city and town clerks, so as to be received by them twelve hours at least previous to the day of election. The same shall be sent in sealed packages, with marks on the outside clearly designating the polling-place for which they are intended and the number of ballots of each kind inclosed; and the respective city and town clerks shall on delivery to them of such packages return receipts therefor to the secretary. The secretary shall keep a record of the time when, and the manner in which the several packages are sent, and shall preserve for the period of one year the receipts of the city and town clerks.

17. The two sets of ballots, together with the specimen ballots and cards of instruction printed by the city clerks, as herein provided, shall be packed by them in separate sealed packages, with marks on the outside clearly designating the polling precincts for which they are intended, and the number of ballots of each kind inclosed.

18. The several city and town clerks shall send to the election officers of each voting-place before the opening of the polls on the day of election one set of ballots so prepared, sealed, and marked for such voting-place, and a receipt of such delivery shall be returned to them from the presiding or senior election officer present, which receipt, with a record of the number of ballots sent, shall be kept in the clerk's office. At the opening of the polls in each polling-place the seals of the packages shall be publicly broken, and the packages shall be opened by the presiding election officer, and the books or blocks of ballots shall be delivered to the ballot officers hereinafter provided for. The cards of instruction shall be immediately posted at or in each voting shelf or compartment provided in accordance with this act for the marking of the ballots, and not less than three such cards and not less than five specimen ballots shall be immediately posted in or about the polling-room, outside the guard-rails. The second set of ballots shall be retained by the respective clerks until they are called for or needed for the purposes of voting, and, upon the requisition in writing of the presiding election officer of any voting-place, the second set of ballots shall be furnished to such voting-place in the manner above provided as to the first set.

19. In case the ballots to be furnished to any city or town or voting-place therein, in accordance with the provisions of this act, shall fail for any reason to be duly delivered, or in case after delivery they shall be destroyed or stolen, it shall

be the duty of the clerk of such city or town to cause other ballots to be prepared substantially in the form of the ballots so wanting and to be furnished; and upon receipt of such other ballots from him, accompanied by a statement under oath that the same have been so prepared and furnished by him, and that the original ballots have so failed to be received or have been so destroyed or stolen, the election officers shall cause the ballots so substituted to be used in lieu of the ballots wanting, as above.

#### ADDITIONAL ELECTION OFFICERS.

20. Two inspectors, with two deputy inspectors, additional to those now provided for, shall be appointed in each voting precinct in cities and in towns divided into voting precincts, and the provisions of law relative to inspectors and deputy inspectors shall be applicable to such additional officers. Two of the inspectors acting in each voting precinct shall be detailed to act as ballot clerks. In towns not divided into voting precincts, two inspectors, with deputy inspectors, shall be appointed, in accordance with the provisions of law applicable to such officers in towns so divided, and the two inspectors thus serving shall act as ballot clerks. The two ballot clerks detailed and appointed as above in each voting precinct and town shall have the charge of the ballots therein, and shall furnish them to the voters in the manner hereinafter set forth. A duplicate list of the qualified voters in each precinct and each town not divided into precincts shall be prepared for the use of the ballot clerks, and all the provisions of law relative to the preparation, furnishing, and preservation of check-lists shall apply to such duplicate lists.

#### VOTING SHELVES OR COMPARTMENTS.

21. The officers in each city or town whose duty it is to designate and appoint polling-places therein shall cause the same to be suitably provided with a sufficient number of voting shelves or compartments, at or in which voters may conveniently mark their ballots, so that in the marking thereof they may be screened from the observation of others, and a guard-rail shall be so constructed and placed that only such persons as are inside said rail can approach within six feet of the ballot boxes and of such voting shelves or compartments. The arrangement shall be such that neither the ballot-boxes nor the voting shelves or compartments shall be hidden from view of those just outside the said guard-rail. The number of such voting shelves or compartments shall not be less than one for every seventy-five voters qualified to vote at such polling place, and not less than three in any town or precinct thereof, and not less than five in any voting precinct of a city. No persons other than the election officers and voters admitted as hereinafter provided shall be permitted within said rail, except by authority of the election officers for the purpose of keeping order and enforcing the law. Each voting shelf or compartment shall be kept provided with proper supplies and conveniences for marking the ballots.

#### PREPARATION OF BALLOTS.

22. Any person desiring to vote shall give his name, and, if requested so to do, his residence, to one of the ballot clerks, who shall then upon announce the same in a loud and distinct tone of voice, clear and audible, and if such name is found upon the check-list by the ballot officer having charge thereof, he shall likewise repeat the said name, and the voter shall be allowed to enter the space inclosed by the guard-rail as above provided. The ballot clerk shall give him one, and only one, ballot, and his name shall be immediately checked on said list. If the voter is a woman, she shall receive a special ballot containing the names of candidates for school committee only. Besides the election officers, not more than four voters in excess of the number of voting shelves or compartments provided shall be allowed in said inclosed space at one time.

23. On receipt of his ballot the voter shall forthwith, and without leaving the inclosed space, retire alone to one of the voting shelves or compartments so provided and shall prepare his ballot by marking in the appropriate margin or place, a cross [X] opposite the name of the candidate of his choice for each office to be filled, or by filling in the name of the candidate of his choice in the blank space provided therefor, and marking a cross [X] opposite thereto; and, in case of a question submitted to the vote of the people, by marking in the appropriate margin or place, a cross [X] against the answer which he desires to give. Before leaving the voting shelf or compartment the voter shall fold his ballot, without displaying the marks thereon, in the same way it was folded when received by him, and he shall keep the same so folded until he has voted. He shall vote in the manner now provided by law before leaving the inclosed space, and shall deposit his ballot in the box with the official indorsement uppermost. He shall mark and deposit his ballot without undue delay and shall quit said inclosed space as soon as he has voted. No such voter shall be allowed to occupy a voting shelf or compartment already occupied by another, nor to remain within said inclosed space more than ten minutes, nor to occupy a voting shelf or compartment for more than five minutes in case all of such shelves

or compartments are in use, and other voters are waiting to occupy the same. No voter not an election officer whose name has been checked on the list of the ballot officers, shall be allowed to re-enter said inclosed space during said election. It shall be the duty of the presiding election officer for the time being to secure the observance of the provisions of this section and of other sections relative to the duties of election officers.

24. No person shall take or remove any ballot from the polling-place before the close of the polls. If any voter spoils a ballot he may successively obtain others, one at a time, not exceeding three in all, upon returning each spoiled one. The ballots thus returned shall be immediately canceled, and together with those not distributed to the voters, shall be preserved and with the check-list used by the ballot clerks, which shall be certified by them to be such, shall be secured in an envelope, sealed, and sent to the several city and town clerks, as required by law in the case of the ballots cast, and the other check-list used.

25. Any voter who declares to the presiding election officer that he was a voter prior to the first day of May in the year eighteen hundred and fifty-seven, and cannot read, or that by blindness or other physical disability he is unable to mark his ballot, shall, upon request, receive the assistance of one or two of the election officers in the marking thereof, and such officer or officers shall certify on the outside thereof that it was so marked with his or their assistance, and shall thereafter give no information regarding the same. The presiding officer may, in his discretion, require such declaration of disability to be made by the voter under oath before him, and he is hereby qualified to administer the same.

26. If the voter marks more names than there are persons to be elected to an office, or if for any reason it is impossible to determine the voter's choice for any office to be filled, his ballot shall not be counted for such office. No ballot without the official indorsement shall, except as herein otherwise provided, be allowed to be deposited in the ballot-box, and none but ballots provided in accordance with the provisions of this act shall be counted. Ballots not counted shall be marked "defective" on the back thereof, and shall be preserved, as required by section twenty-four.

#### PENALTIES.

27. A voter who shall, except as herein otherwise provided, allow his ballot to be seen by any person with an apparent intention of letting it be known how he is about to vote, or place any distinguishing mark upon his ballot, or who shall make a false statement as to his inability to mark his ballot, or any person who shall interfere, or attempt to interfere with any voter when inside said inclosed space, or when marking his ballot, or who shall endeavor to induce any voter before voting to show how he marks or has marked his ballot, or otherwise violate any provision of this act, shall be punished by fine of not less than five dollars nor more than one hundred dollars; and election officers shall report any person so doing to the police officer in charge of the polls, whose duty it shall be to see that the offender is duly brought before the proper court.

28. Any person who shall, prior to an election, willfully deface or destroy any list of candidates posted in accordance with the provisions of this act, or who, during an election, shall willfully deface, tear down, remove or destroy any card of instruction or specimen ballot printed or posted for the instruction of voters, or who shall, during an election, willfully remove or destroy any of the supplies or conveniences furnished to enable a voter to prepare his ballot, or shall willfully hinder the voting of others, shall be punished by fine of not less than five dollars nor more than one hundred dollars.

29. Any person who shall falsely make or willfully deface or destroy any certificate of nomination or nomination-paper, or any part thereof, or any letter of withdrawal, or sign any such certificate or paper contrary to the provisions of this act; or file any certificate of nomination or nomination-paper or letter of withdrawal, knowing the same or any part thereof to be falsely made; or suppress any certificate of nomination or nomination-paper, or any part thereof which has been duly filed; or forge or falsely make the official indorsement on any ballot; or willfully destroy or deface any ballot, or shall take or remove any ballot outside of the inclosure provided for voting before the close of the polls, or willfully delay the delivery of any ballots, shall be punished by fine not exceeding one thousand dollars, or by imprisonment in the jail not more than one year, or by both such fined and imprisonment.

BALLOU, HOSEA, an American clergyman and author, and one of the founders of the Universalist denomination in America, born at Richmond, N. H., in 1771, died in 1852. He was literally a self-educated man, having learned to form the letters of the alphabet with a piece of charcoal on a strip of birch-bark. He began to preach early in life, and was successively minister of congregations in Portsmouth, N. H., Salem, Mass., and Boston. He

was editorially connected with the "Universalist Magazine" and the "Expositor," and wrote numerous religious books, the principal being *Notes on the Parables and Examination of the Doctrine of a Future Retribution*.

BALLOU, HOSEA (1796-1861), grand-nephew of the above, also an eminent Universalist minister, author, editor and the first president of Tufts College.

BALL'S BLUFF, Loudoun county, Va., a steep bank 150 feet high, on the right side of the Potomac River. The place is famous for having been the scene of a battle between the Union forces and Confederates, Oct. 21, 1861, in which the former were badly defeated, and their leader, Col. E. D. Baker, killed.

BALLSTON (BALLSTON SPA), the county-seat of Saratoga county, N. Y. It is on the Rensselaer and Saratoga Railroad, and distant from Saratoga about six miles. The mineral springs here are acidulous chalybeates, and are considered among the best in the United States.

BALLY, a Celtic word meaning "town." It is used as a prefix in the names of many Scottish or Irish places.

BALLYETT, EMANUEL (1700-1773), a French antiquarian and bishop. He was a member of the Barefooted Carmelites' order.

BALLYMOONEY, an Irish market town in Antrim, about fifty-three miles from Belfast. It carries on linen manufacture.

BALM, COL. DE, the name of a mountain pass which forms that portion of the route from Martigny to Chamounix, which lies between Mont Blanc and the Dent du Midi. The summit rises to a height of 7,200 feet.

BALMERINO, a small Scottish village in the county of Fife, on the Tay Firth. Near this village are the ruins of a Cistercian abbey, dating from 1227, whose lands became the property of Sir James Elphinstone, made Lord Balmerino in 1604. The sixth and last lord was executed on Tower Hill in 1746 for his share in the rebellion of 1745.

BALOTRA, a town of India, in the Rajpoot state of Goodpoor, situated on the Loonee. It is a resort of pilgrims, who, on their way to Dwarka, often crowd the bazaars of the town, thus providing for its inhabitants their principal means of subsistence.

BALSAM, CANADA, an article of commerce obtained by puncturing the blisters which are found on balsam trees (*Abies balsamea* and *Abies grandis*), and gathering the sap. It is used in the composition of medicines, varnish, etc.

BALSAM, a name given the garden flower, often called "lady's slipper." It is found native in the East Indies, and some varieties are native in Europe and the United States. The flower is irregular, calyx and corolla hardly to be distinguished. There are about 135 varieties. The snap-weed, or touch-me-not, is so named because the ripe pods burst open on being touched, and scatter the seeds. The plant may be trained, by pinching and pruning, into various shapes, making it bloom more profusely and adding to its appearance. The stems of one of the species—Fulvous or Tawney Impatiens—are sometimes used as a poultice for tumors to reduce inflammation, and a salmon-red dye can be made from its deep orange flowers.

BALSAMINACEÆ, or BALSAMINEÆ, a natural order of succulent, herb-like plants, thought by some botanists to be a sub-order of the *Geraniaceæ*.

BALSAMODENDRON, the name given to a genus of small bushy trees of the natural order *T. schinifera*. They are characterized by a scanty

foliage, and by the resinous substance called balsam, which the fruit and wood yield. They usually strongly resemble a shrub, and in some cases are covered with spines. There are several species, Balsam (or Balm) of Gilead, Elemi, Myrrh and Bdellium, and they are all generally found in Arabia, Eastern Africa, and the East Indies. See *Britannica*, Vol. III, p. 293; Vol. XVII, p. 121.

BALTIA, the Basilia of Pytheas, according to a tradition, a large island distant three days' sail from Seythia. It is impossible to identify the island at the present time, but some think the word Baltic derived from Baltia.

BALTIC PROVINCES (in Russia), a term which in a wider sense comprehends the five Russian governments bordering on the Baltic, namely: Courland, Livonia, Esthonia, Petersburg, and Finland. In a restricted sense, it often designates the first three. The Baltic Provinces once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia, partly in the beginning of the 18th century, through the conquest of Peter the Great, partly under Alexander in 1809. They have an area of about 200,000 square miles, with a population of 5,000,000, including St. Petersburg.

BALTIC QUESTION, the controversy between Russia and the Baltic provinces of Livonia, Esthonia, and Courland. Peter the Great promised them freedom of conscience and the maintenance of their German administration. The conduct of Alexander II was such that the people insisted on his confirming the rights and privileges allowed them by Peter the Great. Articles were signed in February, 1856.

BALTIMORE. To what is given in the *Britannica*, Vol. III, p. 298, relative to this important American city, we add the following: Baltimore has an excellent harbor, and freight is readily transferred from the railways to the shipping. Among the public buildings are the Bialto, where the stock boards meet, the Academy of Music, the City Court-house, United States Court-house, Post Office, Exchange, Athenæum and Maryland Institute. There is also in Baltimore a shot-tower 246 feet high.

The principal institutions of learning are the Johns Hopkins University and hospital, situated at Clifton, within the city limits, having a large endowment; the Peabody Institute, which includes an academy of art and conservatory of music; Loyola College; St. Mary's College and Seminary, and the University of Maryland, which includes law and medical schools. The public schools include Baltimore City College, a State normal school, and 120 graded schools. Instruction is given separately to boys and girls, and separate schools are kept for colored children. Charitable institutions here are numerous—such as the infirmary, three asylums for the insane; the State institution for the blind, one for deaf-mutes, one for the blind (colored), and many orphanages, asylums, hospitals, homes for aged women, for old men, and for the friendless, besides a State penitentiary, jail and house of refuge. Patterson Park on the east side, containing 54 acres, and Riverside Park on the south side of the city, are very handsome. Of the suburban cemeteries, Greenmount is the most extensive.

The export trade of Baltimore, both foreign and domestic, is immense, including naval stores, cotton and provisions. The imports include goods manufactured in Europe and products of West Indies and South America. The average annual value of imports from 1880 to 1888 was \$13,880,117; average annual exports for the same years, \$51,333,090. The Patuxent River furnishes a great and unfailing

water power. The debt of Baltimore, Jan. 1, 1891, may be thus stated:

|                                         |                 |
|-----------------------------------------|-----------------|
| Total funded debt, par value            | \$30,116,752.50 |
| Total guaranteed debt par value.        | 922,000.00      |
| Total debt                              | 31,108,752.50   |
| Value of sinking fund.                  | 7,300,000.00    |
|                                         | 23,808,752.50   |
| Productive and interest-bearing assets. | 10,763,220.91   |
| Leaving balance of debt.                | 13,045,531.59   |

Among the historic events of this city were the bombardment of Fort McHenry by the British, and the battle of North Point, where the British were expelled in the war of 1812-15.

The population in 1770 was 13,503; 1780, 26,514; in 1810, 35,538; in 1820, 62,738; in 1830, 80,625; in 1840, 102,313; in 1850, 169,054; in 1860, 212,418; in 1870, 267,354; in 1880, 332,313; population by city census of 1888, including "the Belt" (a portion of the county annexed to the city that year), 416,805. Of these 64,509 are colored. Population in 1890, 433,547.

BALTIMORE, a small village of Ireland, on the bay of the same name, in the county of Cork. It is seven miles south-west of Skibbereen, and has an extensive occupation in fishing. There is here a technical school founded in 1887 by the Baroness Burdett-Coutts, in which are taught all the branches pertaining to fishing-net-making, sail-making, and other industries of a sea-faring life.

BALTIMORE, LORD (SIR GEORGE CALVERT), born in Yorkshire, England, about 1582, died in London, April 15, 1632. He was the first Lord Baltimore. He graduated at Oxford and then went abroad for travel. James I made him secretary of state, but he changed to the Roman Catholic religion in 1624 and resigned his office. He was interested in colonization and spent much money on a settlement in Newfoundland, which place he visited, but finding it too cold he sailed southward to Virginia. Charles I granted him the land now comprised in Delaware and Maryland, but Lord Baltimore died before the papers were satisfactorily completed. He was a popular man in his time; a strong believer in the divine right of kings; yet he advocated popular institutions and freedom of conscience. See *Britannica*, Vol. IV, p. 713; Vol. XV, p. 605; Vol. XVII, p. 385; Vol. XVIII, p. 495.

BALTIMORE BIRD, or BALTIMORE ORIOLE, a very beautiful American bird, found in all parts of the United States, and as far north as 55° N. lat.,

The Baltimore oriole is about seven inches in length. Its bill is conical, very acute and a little curved; the plumage brilliant, particularly in the adult males, glossy black, finely contrasting with bright orange and vermillion; the cause, it is said, of its name—the Baltimore livery being yellow and black. The tail is longish, rounded and slightly forked. The bird is remarkably active and lively, its song extremely agreeable. Its nest is a curious and interesting structure, a pendulous cylindrical pouch of six or seven inches long, usually suspended from two twigs at the extremity of a lofty drooping branch, the materials, which vary according to circumstances, being woven together with great nicety. It is sometimes sewed through and through with long horse-hairs. They are quite distinct from the true orioles.

BALTISTAN, the name of the Alpine region which lies below the Karakorum and Himalaya Mountains, having an average height of 11,000 feet. Here rises a lofty peak which ascends to an elevation of 28,278 feet above the sea level and is surpassed in height only by Mt. Everest. The natives belong to the Mongolians, and they are under the government of Kashmir. This region is also called Little Thibet, and it is watered by the Upper Indus.

BALTIK is a Bulgarian town, constituting one of the ports of the Black Sea. It is situated 20 miles north-east of Varna, and not far from it lies the ruined town of Tomi, the home of Ovid during his exile.

BALUCHISTAN, a British protectorate south of Afghanistan. Population, about 500,000. For early history, see *Britannica*, Vol. II, pp. 299-303.

The reigning sovereign is Mir Khudadad Khan, Khan of Khelat, who succeeded his brother in June, 1857; born 1841; eldest son, Mir Muhammad Khan.

#### KHANS OF KHELAT SINCE 1700.

|                          |                             |
|--------------------------|-----------------------------|
| Abdulla Khan.            | Mihrab Khan, 1819-1840.     |
| Muhabbat Khan.           | Shah Nawaz Khan, abdicated. |
| Nasir Khan I, 1755-1795. | Nasir Khan II, 1840-1857.   |
| Mahmud Khan.             | Khudadad Khan, reigning.    |

The power of the Brahui khans of Khelat was founded towards the end of the 17th century by a hill chief named Kambar. Called in to protect the Hindu Raja of Khelat against marauders from the east, Kambar first expelled these invaders and then overthrew the Hindu dynasty. His successors gradually made themselves supreme from Khelat to the Arabian Sea, and about 1740 Abdulla Khan, the fourth Brahui khan of Khelat, was acknowledged as chief of Baluchistan by Nadir Shah. The districts of Quetta and Mustang were granted to Abdulla's son, Nasir Khan I, by Ahmed Shah, the Durani king of Afghanistan. Nasir Khan's grandson, Mehrab Khan, was killed in the storming of Khelat by a British force in 1840. His son, Nasir Khan II, was acknowledged by the British Government in 1841, and in 1854 a treaty was executed with him, under the terms of which he received a yearly subsidy of 50,000 rupees. Nasir Khan was succeeded by his brother, Khudadad Khan, now reigning, with whom a fresh treaty was concluded in December 1876, by which the subsidy was raised to 100,000 rupees a year. The Khan also made over the district of Quetta to be administered by British officers, at first receiving the surplus revenue, but since 1882 an annual quit-rent of 25,000 rupees.

The Khan of Khelat is at the head of a confederacy of chiefs, but his powers cannot be precisely defined. In all important matters he is amenable to the advice of the agent to the Governor-General of India, who also arbitrates in disputes between the Khan and minor chiefs.

The area of Baluchistan includes British Baluchistan, assigned to England by the Ameer of Af

THE BALTIMORE ORIOLE.

but migrating to tropical or sub-tropical regions in winter. The genus to which it belongs is usually referred to the natural family of *Icteridae*.

ghanistan in 1878, constituted a chief commissionership in November, 1887, and comprising Pishin, Shorarud, Kach, Kawas, Harnai, Sibi and Thull-Choriali, with an area of about 11,100 square miles. The nomad Baluchis are the most widely spread race, the Brahuis of the eastern plateau being the dominant race.

The principal towns are Khelat, Mustung, Kozdar, Bela, Kej, Bagh, Dadar, Gandavi Nushki, Sarawan, Pashi, Sonmiani, and Quetta.

The religion is Mohanmedan.

There is no standing army; but the Khan could perhaps assemble, at an emergency, 10,000 irregular tribal levies, indifferently armed. The fortifications recently erected by the Indian government lie within the territory under British administration. The numerous forts scattered about Independent Baluchistan could offer no resistance against artillery.

The Khan of Khelat's revenue consists of his subsidy from the Indian government of 100,000 rupees a year, his quit-rent of 25,000 rupees for the Quetta district, and a share in the agricultural produce taken from the inferior cultivators in Independent Baluchistan, Brahuis being exempt.

The agricultural produce of Baluchistan is limited, owing to the scanty and uncertain rainfall, but most of the crops grown in India may be found in the country. Petroleum is found at Khatum. Baluchistan is an immense camel-grazing country. Local manufactures are unimportant, being confined to a few matchlocks and other weapons. The chief exports are wool, hides, madder, dried fruit, bdellium, tobacco and dates. In 1888-89 the exports to British India were valued at 500,000 rupees, and the imports from British India at 396,000 rupees.

The country through which the Bolan and Scind-Pishin Railways run is under British administration. Elsewhere camels serve as a chief means of transport.

There is a line of telegraph to Quetta, and the submarine cable from Karachi to the Persian Gulf touches at Gwadar.

BAMBERGER, LEOWIG, a distinguished author and statesman, born in Mentz, Germany, in 1823. He supported the revolution of 1848, and on its failure became an exile. In Paris he became known as a writer on finance and political economy. He returned to his native town after the war of 1866, and was a member of the customs-parliament. During the Franco-Prussian war he was an adviser of Bismarck at the headquarters of the latter, and afterwards assisted in the adjustment of the affairs of Alsace. He was elected to the imperial parliament in 1871, where he strongly opposed the adoption of the protective tariff. The writings of Bamberger are numerous and influential, dealing in a masterly way with the financial, labor and other social questions of the hour.

BAMBINO, a term in art descriptive of the swaddled figure of the infant Saviour, which, surrounded by a halo and watched over by angels, occasionally forms the subject of altar pieces in the Roman Catholic churches.

BAMBOCCIADE (*bamboccio*, Italian word, meaning simpleton), a word derived from Bamboccio, the surname of a painter called Peter van Laer, who

lived between 1613 and 1674. He painted grotesque scenes of common life, such as rural festivals. The word is, therefore, applied to pictures which represent boorish frolics.

BAMO, B'HAMO, or B'HAN-MO, the most important city of Burmah, Farther India; is situated on the Irrawaddy, at the mouth of the river Tamping. Vast quantities of goods, brought here by camel caravans, are annually exported. Cotton is a chief production.

BAN and ARRIÈRE BAN. In feudal times in France the term meant the entire military force of the country. The *ban* was the barons summoned to war; the second levy, which included their vassals, was known as the *arrière ban*.

BAN, or BANAT, the term used in Eastern Hungary for military governors of certain districts or *banats*. They were appointed by the king, and had extensive political, military and judicial rights. Dalmatia, Slavonia, Bosnia, Croatia and Makovia were the chief banats, but they were finally united under the banats of Croatia and Dalmatia.

BANANA-BIRD, a native of the West Indies and warm parts of America. It is larger than the Baltimore bird though of the same species. Its colors are tawny and black, with white bars on the wings. It also suspends its nest at the end of twigs to be out of the reach of snakes and monkeys.

BANANA-BIRD.

BANAS, or BUNAS, the name by which three rivers of India are known. The first, in Rajputana, taking its rise in the mountainous region of the Arvalli, flows through Mewar for 120 miles in a northeasterly direction, then southeasterly for about 150 miles, and pours its waters into the Chambal. The second river rises in the same land, flows southwest for 180 miles and dissolves itself in the Runn of Cutch. The third, a river of Bengal, in Chutia Nagpur, runs 70 miles toward the northwest, and falls into the Son, near Rampur. See Britannica, Vol. XX, p. 260, and Vol. XXII, p. 98.

BANC, legally a seat or bench of justice, and in this sense has given rise to the expression of the courts of law, "sitting in bane," or *in banco*; that is, sitting together on the bench of their respective courts, in term-time, and otherwise, as provided by statute.

BANCO, a commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The term is now chiefly applied to the money in which the Hamburg bank keeps its accounts, which is not represented by any coinage. Genoa had at one time a bank standard, and the present current money being different from that is still called "fuori banco" outside the bank.

BANCROFT, GEORGE, son of Rev. Aaron Bancroft, born at Worcester, Mass., Oct. 3, 1800, died at Washington, D. C., Jan. 17, 1891. He graduated at Harvard in 1817 and went to Germany, where he spent two years studying German, French and Italian literature, Greek philosophy, natural history, Arabic, Hebrew and Scriptural interpretation. The University of Göttingen conferred upon him the degree of Ph. D. It was at this time that he selected history for his special branch of work. He removed to Berlin and made the acquaintance of Humboldt, Savigny, Goethe and other famous men. He further pursued his studies with Schlosser, the historian. He returned to the United States in 1822, and, after serving as a Greek tutor in Harvard for a year, started, in partnership with Dr.

BAMBINO.

Joseph G. Cogswell, the Round Hill school at Northampton, Mass. About this time he declined the nomination to the Massachusetts assembly, and later the nomination to the State senate. He was engaged in making translations from Schiller, Goethe and the poetical works of Heeren. Mr. Bancroft was a Democrat, and Van Buren made him collector of the port of Boston in 1838. In 1842 he was an unsuccessful candidate for governor, but, on the election of Polk to the presidency, was made Secretary of the Navy. It was through his influence in his official capacity that the Annapolis Naval Academy was established. He issued the famous orders to take possession of California in the event of war with Mexico, and (while acting as secretary of War *pro tem.*) he ordered the American troops to march into Texas. Mr. Bancroft was honored with several foreign missions. In 1846 he was sent as minister to the Court of St. James; in 1867, to Prussia; in 1868, to the North German Confederation; in 1871, to the new German Empire, whence he was recalled three years later, at his own request. He had an active part in settling with England the question of the North-western boundary. The second important treaty in which he was engaged was that concerning expatriation rights. This was discussed by Germany and the United States. The conclusion arrived at was that a person has freedom to choose to what country he will render allegiance. Great Britain afterwards subscribed to this treaty. Mr. Bancroft's greatest work was that of the historian. In 1834 he began the publication of his *History of the United States*. It opens with the discovery of America by Columbus and chronicles events down to the close of the Revolutionary War and the formation of the Constitution. This is a very exhaustive history, and has received the highest commendation from such scholars as Prescott, Edward Everett, Von Raumer, Baron Bunsen and George Ripley. In 1885 he completed the revision of his history, and it was then published in five volumes. Mr. Bancroft delivered many addresses, which he had published. He also was at work on a biography of James K. Polk. Mr. Bancroft had made his winter home in Washington for several years. He was a man of careful habits, fond of walking and horse-back riding. His manners were extremely courteous. His height was somewhat below the average, and in his youth he was spoken of as "Little Bancroft." In a letter to a friend, written in 1882, he says: "I was trained to look upon life here as a season for labor. Being more than four score years old I know the time for my release will soon come. Conscious of being near the shore of eternity, I wait without impatience and without dread the beckoning of the Hand which will summon me to rest."

BANCROFT, HERBERT HOWE, born in Granville, Ohio, May 5, 1832. He went in 1848 to Buffalo and entered the bookstore of his brother-in-law. Four years later he was sent to California to establish a branch business. Here he became interested in collecting books relative to the history of the Pacific coast. He was so fortunate as to secure the library of the Mexican emperor Maximilian. He collected a library of 45,000 volumes. With this material at hand Mr. Bancroft has begun a history of that region. At great pains he has obtained from pioneers and settlers many valuable narratives which have since been written down and indexed. He has published *The Native Races of the Pacific States* (five vols.). In this work he has been aided by an experienced corps of writers. He has planned to publish 39 volumes of the *History of the Pacific States of North America*. Mr. Bancroft is an en-

ergetic business man as well as a learned and accomplished writer. His executive ability has enabled him to collect this fine library and to commence upon so great a work as this history promises to be. In 1886 he met with a great loss in the burning of his brother's store, where the sheets of seven volumes of his history were kept.

BAND, or BANDS, formerly a portion of clerical dress and the only relic of the ancient *amict*, a linen vestment which was used in the ancient church to cover the shoulders and neck of the priest. It also formed part of the dress of functionaries in schools of old foundation, and of members of the bar, and consists of two pieces of linen pendant from the neck.

BANDAJAN, a Himalaya mountain pass of Kashmir. The mountains surrounding this pass are composed of gneiss, and the summit rises to an elevation of 14,854 feet above sea level. Here snow continually rests. It is situated in lat. 30° 22' N., long. 78° 4' E.

BANDANA, a kind of printed handkerchief of Indian origin. The cloth is first dyed Turkey-red, and then the pattern is made by discharging the color with bleaching liquor in a powerful Bramah press. The pattern to be discharged is cut out on two plates of such metal (lead) as may not be acted on by the liquor, and of the full size of the handkerchief. A dozen or more are put in at once between the plates, and so many of these courses are entered together as fill the press, when the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth-folds in the press. The pressure on the cloth, to make clean work by preventing the spreading of the liquor, is enormous. The patterns in the real bandana style of printing are spots and diamond prints the best suited for discharging, and even for these a pressure of 500 tons is required to work them clean.

BANDA ORIENTAL, the former name of URUGUAY. See *Britannica*, Vol. XXIV, pp. 14-16.

BANDEL, ERNST VOX, an eminent modern sculptor, born at Anspach in 1800, died near Donauwörth in 1876. He studied at Munich, where in 1820 he sent to the exhibition a life-sized plaster figure of Mars reposing, which attracted much attention, and at Nuremberg and Rome. His principal work was the statue of Arminius, 90 feet high, near Detmold, which the Emperor William unveiled on Aug. 16, 1875.

BAN-DE-LA-ROCHE, otherwise known by its German name as the Steinthal, a valley of Lower Alsace, in the Vosges mountains. It is noted as the scene of the labors of Oberlin, "the Pastor of the High Alps," whose tomb is at Fondy, a village at the entrance to the valley.

BAND-FISH, or SNAKE-FISH, a genus of fishes of the Ribbon-fish family. The body is much elongated and compressed. The bones a little more solid than a mere fibrous network, and everything else exhibits a corresponding delicacy, so that specimens are seldom obtained in an uninjured state. All the species inhabit quiet depths, and are incapable of contending with waves and currents. They are native of Japanese waters, though one species is not rare in the Mediterranean.

BANDICOOT RAT, MALABAR RAT, or PIG RAT, the largest species of rat, which sometimes weighs three pounds, and measures from 24 to 30 inches in length from tip to tail. Its flesh is eaten by the coolies of India and esteemed very delicate, being thought to resemble young pork. This rat is found in Ceylon and certain parts of India; dry and hilly districts are its favorite

haunts. It is a very destructive animal in gardens, roots and grains being its chief food.

**BANDIERA**, **ATTILIO** and **EMILIO**, two brothers descended from a distinguished aristocratic family of Venice and well known for their tragic fate. They were lieutenants in the Austrian navy, their father being rear-admiral, but instead of sharing his pro-Austrian sentiments they cherished enthusiastic dreams of the free and united Republic of Italy. In 1842 they entered into correspondence with Mazzini. In 1843 they believed that the time had come for a revolution, but their premature appeal finding no practical response they fled to Corfu in 1844, where they endured many bitter disappointments and much misery. At length, misled by false rumors of a rising in Naples, with which it is supposed the Neapolitan police had something to do, they ventured to land with 20 companions at the mouth of the small river Neto, in Calabria, believing that their appearance would be the signal for a general insurrection. The Neapolitan government expected them, as one of their companions, *Boccheciampe*, had betrayed them. They were attacked by an overwhelming force and were nearly all taken prisoners at once. Nothing was ever allowed to transpire respecting the trial of these men. *Attilio* and *Emilio* were shot with seven of their comrades, in the public square of Cosenza, July 25, 1844. They died joyfully, exclaiming "Viva l'Italia!" A year later their remaining companions were pardoned.

**BANDIT**, a word originally signifying a "banished" or outlawed person. Then one who, because outlawed, wages war against civilized society, and finally a highway robber. The bandits, or banditti, formed in Italy in earlier times, as it were, a separate community or guild, who submitted to their own stringent laws, carried on both open and secret war with civilized society, and kept up a certain romantic idea of honor. By means of the severe measures which were adopted in 1820 by the Papal government against the banditti and their abettors their haunts were broken up. Those who still occasionally disquiet the frontiers of Naples are in general people settled on the spot who regard robbery and murder as a trade.

**BANDONG**, a commercial town of Java near the volcano *Gunong*, an eruption of which destroyed, in 1822, eighty villages. See *Britannica*, Vol. XIII, p. 600.

**BANEHERRY**, a perennial herb found in the north of Europe, including two American species which have long been used by the Indians for the cure of snake-bite. It is also known as "Herb Christopher."

**BANER**, **BANNIER**, or **BANNER**, **JOHAN**, a famous Swedish general, born near Stockholm, June 23, 1595, died May 10, 1641. He led the right wing of the army at the battle of *Leipsic*, and after the death of King *Gustavus Adolphus*, he was commander-in-chief.

**BANGOR**, a city of Maine, and county-seat of Penobscot county, beautifully situated at the head of navigation on the west bank of the Penobscot River, at its junction with and on both banks of the *Kenduskeag*. It is an important railroad center, a port of entry, and one of the greatest lumber depots in America. An abundant water-power is supplied by the *Kenduskeag*, and, by means of a dam built across the Penobscot in connection with the *Holly* system of water-works. The season of navigation lasts about eight months, during which more than two thousand cargoes of lumber are shipped, averaging some 200,000,000 feet annually. The vessels entering this port in the coasting and foreign trade are mostly American, and number nearly four hundred, about half of which, aggregating a tonnage of

nearly 35,000, are enrolled, registered and licensed here. An important commercial interest is the manufacture of boots and shoes; and there are numerous other manufactures, including iron, lumber, machinery, furniture, trunks, carriages and sleighs, and an extensive establishment for burnetizing. Bangor is the seat of Bangor Theological Seminary, and contains a number of very valuable libraries. It was first named *Norombega*, after the supposed Indian city mentioned in the *Anatomy of Melancholy*, and in *Paradise Lost*. The name was changed to *Kenduskeag* in 1769, and afterwards to Bangor, in honor of the psalm-tune of that name. Bangor became a city in 1834. The population in 1840 was 8,627; in 1850, 14,432; in 1860, 16,407; in 1870, 18,289; in 1880, 16,856; in 1890, 19,090. See *Britannica*, Vol. III, p. 314.

**BANGOR-ISCOED** (BANGOR BELOW THE WOOD), an inland village, beautifully situated in a fertile and richly wooded country, on the right bank of the *Dee*, on the borders of Flint and Denbigh shires, North Wales, five miles southeast of *Wrexham*. Population, 554.

**BANGS**, **NATHAN**, an eminent American clergyman, born near Bridgeport, Conn., May 2, 1778, died May 3, 1862. In 1802 he was admitted to the New York conference of the Methodist Episcopal Church, and the next six years of his life were spent in arduous labors in the then almost pathless forests of Canada as an itinerant preacher. In 1810 he was transferred to New York city, which was ever after the headquarters of his labors for his denomination. In 1820 he assumed charge of the Methodist Book Concern, and under his management its business was vastly extended. From 1820-28 he was editor of the "Methodist Magazine," and from 1826-28 of the "Christian Advocate." In 1832 he assumed editorial charge of the "Methodist Quarterly Review." In 1841 he became president of Wesleyan University, Middletown, Conn.

**BANIAN** (from the Sanscrit *banij*, a merchant), a word used in India to designate a merchant or trader generally. It is more particularly applied to the great merchants in the west of India, especially in the seaport towns, who, by means of caravans, carry on a very extensive trade with the interior of Asia, even to the borders of Russia and China.

**BANIAN DAYS**, a sailor's phrase, nearly equivalent to the *jours maigres* of the French. The term denotes the days when no meat is served out to a ship's crew. The term is derived from the practice of Banian traders.

**BANISHMENT**, excepting in the penal sense of transportation, with which it is popularly synonymous, can only now be said to have a legal meaning historically. Formerly, in England, parties who were required to abjure the realm, that is, renounce and depart from the country, were, so to speak, banished. But the word appears to have a more technical and precise significance in the Scotch law than in the English, as a punishment of exile from Scotland is inflicted on persons convicted of certain offenses for which that punishment is provided.

**BANIWAS**, a tribe of Indians living along the Amazon and Rio Negro rivers.

**BANJO**, a musical instrument, somewhat like the guitar, but having a head similar to that of a drum or tambourine. It was invented by Joel Walker Sweeney, an American musician, who, while traveling through the South with a wagon circus, had learned to play on the rude instrument of the plantation slave. This was a large, long-necked gourd, with a stick for a

BANJO.

staff, over which was stretched four horsehair strings. Sweeney's first improvement on this rudimentary banjo was in the substitution of the tambourine head for the gourd. This he made out of a meal-sifter, which he covered with old sheepskin. Several modifications followed; but it was not till he had added the fifth string, which he called the "thumb string," that the real banjo of American negro minstrelsy was produced. The instrument has grown in popularity, and many varieties of it have been introduced, some having as many as nine strings. Sweeney often performed before Queen Victoria with great applause. He was born in 1813, and died in 1860. His grave is at Appomattox Va. his native town.

BANK-BAN, ban, or chieftain, during the first part of the thirteenth century, of Hungary, lives in Hungarian literature and has a romantic fame. His wife was seduced by Eckart, Queen Gertrude's brother, the Queen aiding in the evil deed. Discovering the Queen's participation, he aroused the people to help him break into the palace and kill her. King Andreas II, returning from the war in Poland, put the murderer to death.

BANKES, HENRY (1757-1834), was educated at Westminster and at Trinity College. He was in Parliament from 1780 to 1824. He is the author of *Civil and Constitutional History of Rome, from the Foundation to the Age of Augustus*.

**BANKING SYSTEM IN UNITED STATES.** For the history of banking in various countries and for the discussion of numerous economic questions growing out of the general subject of banking, see Britannica, Vol. III, pp. 315-341.

The present system, known as the National Bank-note System of the United States, was devised and recommended to Congress during the civil war by Salmon P. Chase, Secretary of the Treasury. Its chief purpose was two-fold—first, to secure in the most effective way a sure market for the United States bonds, whose issue was rendered imperative by the continuance of the civil war; and, second, to provide a uniform, safe and most convenient monetary system for the promotion of business transactions and the development of trade and industries among the people. Its whole history shows that its date was most opportune and its methods most wisely directed.

The first act of the National Congress under which the system was organized, was approved by President Lincoln, Feb. 25, 1863. The law was extensively revised and reenacted June 3, 1864. Previous to these dates the system of State banks universally prevailed, of which there were, in the 31 States then existing, 1,601, with an aggregate capital of \$429,000,000. More than 10,000 different kinds of bank-notes were in use in a total circulation of about \$202,000,000.

The act of 1864 provided for the establishment, in the Government Treasury Department at Washington, of a national bank bureau, with a chief officer, to be known as comptroller of the currency. Under the provisions of the new law any number of persons, not less than five, might be organized into a national banking association, the capital in no case to be less than \$100,000, except that in any cities containing a population of not more than 6,000 the capital should not be less than \$50,000; and in cities having a population of not less than 50,000, the capital must not be less than \$200,000. Not less than one-third of the capital was required to be invested in United States bonds, upon which circulating notes could be issued equal to 90 per cent. of the current market value, but not exceeding 90 per cent. of the par value of the bonds deposited. These were to be received at par in the United States in all payments to and from the Government, except for duties on imports, interest on the public debt, and in redemption of national currency. As early as March 3, 1865, an important additional act was passed requiring that every banking association should pay a tax of 10 per cent. on the notes of any person or State bank used for circulation or paid out by them. This act

virtually resulted in taxing State bank circulation out of existence.

A total issue of \$300,000,000 of circulation was authorized by the act of 1864; but an act of May 12, 1870, authorized an increase of circulation to \$354,000,000. Another act, that of June 20, 1874, provided that any bank by depositing with the United States Treasury in sums not less than \$9,000 at a time, might withdraw a proportionate amount of the bonds on deposit as security for its circulating notes. An act passed Jan. 14, 1875, removed all limitations as to the amount of the circulating notes of the banks, except the restrictions in the provisions in the law then existing, but required the Treasurer to retire legal tender notes to the amount of 80 per cent. of the additional bank-notes issued, and to continue such retirement until there should be a reduction of the legal tender notes to the amount of \$300,000,000. The provision of the law requiring a reduction of legal tender notes was repealed May 31, 1878.

The National Bank act also required that the national banks in the city of New York should hold in their vaults in lawful money 25 per cent. of their deposits and circulation as a reserve fund. The banks in other redeeming cities were required to hold the same percentage of reserve, but were to be permitted to keep one-half of this reserve in cash deposits in the city of New York. Banks in other cities were required to hold a reserve of 15 per cent., three-fifths of which might consist of balances due from approved associations in the redeeming cities.

With regard to interest on loans, the national banks were allowed to charge at the rate allowed by the States in which they were located, and in case the State had fixed no rate, the banks were allowed to charge 7 per cent.

Under the national banking law, shareholders are held individually, equally and ratably liable for all the debts of the association to the extent of their amount of stock in addition to the amount invested therein. Also the law required that before declaring a dividend, the bank should carry one-tenth of their net profits of the preceding half year to a surplus fund until the same should amount to 20 per cent. of the capital, and should also deduct all losses and bad debts from the net profits.

All these provisions of the national banking law indicate the great care with which the monetary interests of the country were guarded, and the resultant history of the system shows the wisdom manifest in its general plan, and the great excellence of its chief provisions. During the year 1865, nearly all banks in United States, operating under

the State laws, adopted the national system. The number has constantly increased and the number of additions to the system during the year closing Oct. 31, 1890, was larger than that of any previous year since the first. The 307 new banks organized during the last year had an aggregate capital of \$36,250,000, and are distributed among 41 States and Territories. In nearly all cases the banks whose corporate existence would have expired during the year applied for and received from the Government extensions under the act of July 12, 1882. These facts show the increasing popularity of the system.

COMPARATIVE GROWTH FOR TEN YEARS. The number of National Banks in the United States in 1872 was 1,852, with a capital of \$465,676,023, reporting that year a surplus of \$105,181,942, total dividend that year of \$46,687,115, and net earnings amounting to \$58,075,430. The official reports of the same items from 1880 to 1890 furnish the figures of the following table:

| Year ending Sept. 1. | No. of national banks. | Capital.      | Surplus.         |
|----------------------|------------------------|---------------|------------------|
| 1880.....            | 2,072                  | \$454,215,062 | \$120,145,649.00 |
| 1881.....            | 2,100                  | 458,934,485   | 127,238,394.00   |
| 1882.....            | 2,197                  | 473,947,715   | 133,570,931.00   |
| 1883.....            | 2,350                  | 494,640,140   | 141,232,187.00   |
| 1884.....            | 2,582                  | 518,605,725   | 147,721,475.00   |
| 1885.....            | 2,665                  | 544,599,602   | 146,993,495.00   |
| 1886.....            | 2,784                  | 532,459,921   | 155,030,884.00   |
| 1887.....            | 3,049                  | 578,462,765   | 173,913,440.97   |
| 1888.....            | 3,093                  | 583,539,145   | 184,416,990.92   |
| 1889.....            | 3,170                  | 596,392,518   | 194,818,192.19   |
| 1890.....            | 3,351                  | 625,089,645   | 208,707,786.00   |

| Year ending Sept. 1. | Total dividends. | Total net earnings. | Ratio of dividends to capital. |
|----------------------|------------------|---------------------|--------------------------------|
| 1880.....            | \$4,411,473.00   | \$15,186,034.00     | 8.02                           |
| 1881.....            | 38,377,485.00    | 53,622,563.00       | 8.38                           |
| 1882.....            | 40,791,928.00    | 53,321,234.00       | 8.73                           |
| 1883.....            | 40,678,678.00    | 54,007,148.00       | 8.30                           |
| 1884.....            | 41,254,473.00    | 52,362,783.00       | 8.00                           |
| 1885.....            | 40,656,121.00    | 43,625,497.00       | 7.80                           |
| 1886.....            | 42,412,803.00    | 53,165,385.00       | 7.96                           |
| 1887.....            | 44,152,407.92    | 64,506,869.66       | 7.98                           |
| 1888.....            | 46,531,657.83    | 65,360,486.73       | 8.02                           |
| 1889.....            | 46,618,000.27    | 69,618,265.07       | 7.82                           |
| 1890.....            | 51,158,883.33    | 72,655,563.32       | 8.19                           |

After the above table was completed the annual report of the Hon. Edward S. Lacey, the comptroller of the currency, was issued, furnishing some later additional figures. His report states that on Oct. 31, 1890, the number of national banks was 3,567, with a total capital stock of \$659,782,865; bonds deposited to secure circulation, \$140,190,900; and bank-notes outstanding, \$179,755,643, including \$54,796,907 represented by lawful money deposited to redeem the circulation still outstanding. The net increase of national banks during the year was 248; the net increase the previous year was 168; the average yearly net increase for the previous ten years had been 127. On Oct. 2, 1890, the individual deposits in the national banks in the United States aggregated \$1,564,845,275.

NATIONAL BANK ISSUES AND REDEMPTIONS. The following table gives the amount of national bank-notes of each denomination issued and redeemed since the organization of the system, and the amount of each outstanding Oct. 31, 1890:

| Denominations.     | Issued.         | Redeemed.          | Outstanding.     |
|--------------------|-----------------|--------------------|------------------|
| Ones.....          | \$23,169,677    | \$22,800,061.00    | \$369,616.00     |
| Twos.....          | 15,495,038      | 15,311,146.00      | 183,892.00       |
| Fives.....         | 544,788,840     | 494,306,190.00     | 50,482,650.00    |
| Tens.....          | 461,240,000     | 403,621,260.00     | 57,618,740.00    |
| Twenties.....      | 288,323,560     | 244,251,900.00     | 44,071,660.00    |
| Fifties.....       | 97,468,100      | 87,709,800.00      | 9,758,300.00     |
| One hundreds.....  | 147,273,300     | 130,537,200.00     | 16,736,100.00    |
| Five hundreds..... | 11,947,000      | 11,764,000.00      | 183,000.00       |
| One thousands..... | 7,379,000       | 7,333,000.00       | 46,000.00        |
| Total.....         | \$1,597,084,515 | \$1,417,634,557.00 | \$179,449,958.00 |

To the amount outstanding should be added the "unrepresented fractional notes," aggregating \$25,748.25.

REDEMPTION OF NOTES OF BANKS REDUCING OR CLOSING CIRCULATION. The Congressional act of June 20, 1874, provides as stated above for a reduction of the outstanding circulation of banking associations upon the deposit of lawful money with the United States Treasurer, in sums of not less than \$9,000 severally, and the act of July 12, 1882, requires a deposit of lawful money for the retirement of the old circulation whose corporate existence has been extended. Under these acts, and on account of liquidating and insolvent banks, the sum of \$451,299,591 had been deposited with the treasurer prior to Oct. 31, 1890, including \$2,663,720 deposited for the redemption of notes of national gold banks, and \$97,685,833 for the redemption of national bank-notes for the retirement of the old circulation of banks whose corporate existence had been extended.

There are now no national gold banks in existence; but there were yet in outstanding circulation Oct. 31, 1890, notes of extinct gold banks to the amount of \$134,727, and lawful money to cover their redemption was in the treasury at that date.

PUBLICATION OF FREQUENT REPORTS. For the greater protection of shareholders and depositors, the law provides that the comptroller of the currency shall call upon each national bank five times in each year for a detailed report of its condition on some past day specified by the comptroller. These reports are made under oath, and published in some local newspaper. They exhibit the resources and liabilities of the bank in such detail as to enable its shareholders and depositors and other creditors to judge as to the wisdom of its management and the character of its financial condition. Once in each year these reports are printed in a bound volume accompanying the annual report of the comptroller.

RECEIVERSHIPS. The comptroller is clothed by law with the responsibility of appointing receivers and of directing and supervising the affairs of receiverships and the conduct of receivers appointed by him. The Supreme Court of the United States has denominated a receiver as "an agent of the comptroller," and from the manner of his appointment he is regarded by all the courts as an officer of the United States, especially when jurisdictional questions are raised.

It has been held that "a receiver may sue in his own name or in the name of the bank, deriving the right from the United States statutes, and that his personal citizenship does not affect his position in the courts of the United States."

"By virtue of his commission and under the direction of the comptroller he takes possession of the books, records, and assets of every description of a national banking association and is authorized to collect all debts, dues, and claims of every description belonging to it, and upon the order of a court of competent jurisdiction sells and compromises all bad or doubtful debts, and in like manner disposes of all real

estate and personal property of the association, under an order of the court.

"All moneys so collected are remitted to the Treasurer of the United States, with the exception of such as are necessary for the payment of current expenses, and from time to time dividends to creditors are paid by the comptroller's checks, on an assistant treasurer of the United States, forwarded to and delivered by the receivers.

"The funds of an insolvent bank collected by a receiver are held in trust by the treasurer of the United States, and are not invested in interest-bearing securities, but are distributed among creditors as often as the amount justifies the preparation of dividend schedules and checks by a receiver and the clerical force under his immediate control.

"A varying proportion of the liabilities of a trust are always represented by claims unproved and in dispute until its close, and whenever dividends upon proved claims are paid sufficient funds are reserved to place all other claims upon an equal footing whenever their proper status has been determined. The rights of all *bona fide* creditors are observed, and lapse of time will not defeat a just claim before the affairs of the trust are closed on the simple ground of laches. The statutes do not make the decision of the comptroller or the receiver in rejecting a claim against a trust final, and therefore whenever a claim is rejected the responsibility of a determination as to law and facts rests with the courts."

**SOURCES OF PROFIT IN BANKING.** Originally the national banks realized a considerable profit from their circulating notes, but the high rate of premium commanded in the market in later years by the interest-bearing bonds of the United States, which the law requires the banks to deposit as security for their circulation, has rendered the issue of circulating notes in most localities unprofitable. Hence the later reports of the comptroller show that the national banks now organizing issue only the lowest amount of circulating notes obligatory under the law.

The banks rely chiefly on their deposits as their principal source of profit; these deposits are returned to the business public in the shape of loans properly secured, and thus the money is continually kept in circulation among the people. We quote from the annual report of the comptroller bearing date Dec. 1, 1890:

"They [the national banks] are fully cognizant of the fact that no profit will be realized on account of the right to issue notes, and proceed in their organization mainly because of the gain to result by reason of deposits.

"The deposits of a bank usually bear a close relation to the degree of confidence reposed in it by those who live within the sphere of its business activities. The unprecedented success which has, as a whole, attended the operations of banks in the national system during its twenty-eight years' trial, has inspired a degree of confidence not attained by any of its predecessors. In the early years of the system depositors were in some degree doubtful as to its success, and deposits were correspondingly meager. As a consequence, banks were then organized chiefly to secure the profit on circulation.

"It is curious to note how steadily the relative proportion of deposits to capital has increased from year to year, and how close a relation the increased gain by reason of augmented deposits bears to the diminished profits by reason of note issues. This is illustrated by noting the relative increase of capital and deposits during the period extending from Jan. 1, 1865, to Oct. 2, 1890. At the former date the aggregate capital of all national banks amounted to \$163,337,396, and their individual deposits were \$50,212,171. At the latter date the aggregate capital had increased to \$59,447,255, and the individual deposits to \$1,561,815,275. During this period of about twenty-five years the capital stock account shows an increase of \$247,689,880, equal to 61 per cent., while the individual deposits exhibit an increase of \$1,044,622,101, or over 200 per cent.

"This comparison indicates that the rate of increase of deposits has been relatively three and one-half times that of capital. While this growth is, in a certain degree, attributable to the general increase of the capital and business of the country, it is to a greater extent owing to the age of the system and the unexampled success which has attended its operations and the increased confidence thereby inspired. Whatever may be the opinion entertained with regard to the expediency of granting to banks the right to issue notes for circulation, it will be universally conceded that the public welfare is promoted by the augmentation of bank deposits. In this respect we find the interests of the banks and of the whole people identical. It is of great importance that the circulating medium of the country be kept within the channels of trade. Whenever the surplus earnings of the wage-workers, the professional men, the farmers, the manufacturing men, and the tradesmen are permitted to remain idle in

the custody of individuals, legitimate borrowers are caused to pay increased rates of interest, and business and commerce languish for want of adequate banking facilities.

"It is true, beyond controversy, that the national system is admirably adapted to the most thorough and complete utilization of the present supply of money, and all good citizens, and especially those who are honestly of the opinion that this supply is inadequate to the demands of business, should oppose any and all efforts to embarrass or destroy an admirable system in successful operation when none of its opponents is able to suggest any agency adapted to an equally efficient service."

**BANKRUPTCY.** At the present writing, 1891, the bankruptcy laws of Great Britain remain substantially as described in *Britannica* Vol. III, pp. 341-45. See also the same article for the earlier history of the bankruptcy laws of the United States. The act of 1867 (U. S. Congressional Laws) after repeated amendments and modifications, was re-enacted in 1874, and finally repealed in 1878; and the whole subject was again left to the regulation of the laws of the individual States.

**BANKS,** in navigation, are elevations in a sea or river, generally composed of sandy soil; they are sometimes called shoals and are covered, or partially covered, with water.

**BANKS, JOHN** (1709-1751), an English writer, and the author of *Critical Review of the Life of Oliver Cromwell*.

**BANKS, JOHN**, an English dramatist of the 17th and 18th centuries, the author of *The Uncanny Favorite; or, Earl of Essex*, and other tragedies. The dates of his birth and death are unknown.

**BANKS, NATHANIEL PRENTISS**, born at Waltham, Mass., Jan. 30, 1816. After receiving a common school education he became a machinist, a lecturer, an editor, a lawyer, and finally a member of the State legislature. In 1852 he was sent to Congress, but left his party on account of their advocacy of the extension of slavery. He joined the Republicans, who sent him for another term to Congress. He was successively Speaker of the House, Governor of Massachusetts, and in 1861 was made major-general of volunteers, and soon commander of the 5th corps of the Army of the Potomac. In 1862, having gained some advantage at Winchester, his force followed the Confederates to Harrisonburg. Stonewall Jackson unexpectedly fell upon him, obliging a retreat. His command fought at Cedar Mountain, Port Hudson (where 6,000 prisoners were taken), and along the Red River. Relieved of command in 1864, he resigned his commission. From this time till 1877 (except one term) he was sent to Congress from Massachusetts; his active support of Horace Greeley for the presidency costing him his re-election in 1872. He was for a long time chairman of the committee on foreign relations. He has been United States marshal for his State. In 1888 he was again elected Representative to Congress.

**BANKS LAND**, an island in the Arctic Ocean, 70 miles southwest of Melville Island. It is intersected by the parallel of 74° north, and by the meridian of 116° west.

**BANKSIA**, a genus of shrubs of the natural order *Proteaceae*. The species have hard, dry leaves, generally white or very pale-green beneath, and present a remarkable appearance from the umbellate arrangement of their branches, which bear toward their extremities oblong heads of numerous flowers. The flowers secrete much honey. They are natives of Australia, forming a characteristic feature of its vegetation.

**BANNACKS, OR BOXACKS.** See *Britannica*, *INDIANS, AMERICAN*, in these Revisions and Additions.

**BANNOCK**, a cake of home-made bread, common in Scotland. It is usually composed of pease-meal

or of pease and barley meal mixed, prepared without any leaven; it is baked on a circular plate of iron, called a griddle. The bannock is doubtless of great antiquity—being, in fact, the primitive cake, only varied in material, of every country.

**BANNs OF MARRIAGE.** See *Britannica*, **MARRIAGE**.

**BANQUETTE**, in fortification, a foot-bank (bench) or raised way, just inside a breast-work, on which soldiers may stand to fire guns without being too much exposed to the enemy.

**BANSHEE**, the name of a female character in the mythology of Ireland and the Scottish Western Highlands. See *Britannica*, Vol. V, p. 300.

**BANTAMS**, dwarf fowls kept for ornament or as pets. During the last century many new varieties have been originated, and there are now bantams of all the principal breeds. The most curious are the dwarfed Asiatic fowls, cuckoo and Japanese bantams. The Golden Sebright differs from the Silver in being marked with yellow instead of white lacings. The Game bantams are very fine, though not larger than a pigeon, the cock and hen weighing 24 and 20 ounces each. See *Britannica*, Vol. XIX, p. 646.

**BANTU**, the name applied to the languages and people of several African tribes inhabiting the region situated between 20° S. lat. and 60° N. lat. They are divided into three branches, the Kaffirs and Zulus inhabiting the Galla and Somali country in the east the Bechuans dwelling in the central part and the western division being peopled by the tribes dwelling in the region between the Gulf of Guinea and the west coast of the Hottentot country. See *Britannica*, Vol. XII, p. 302; Vol. XVII, p. 319; Vol. XXII, p. 729; languages, Vol. XIII, p. 820; Vol. XVII, p. 318; Vol. XVIII, p. 780; Vol. XXII, p. 729; Vol. XXIV, p. 827.

**BANYARD, JOHN**, born in New York about 1820, and educated in the schools of that city. He executed a panorama of Venice, and afterwards one of the Mississippi River. In order to accomplish the latter work he traveled in a skiff for thousands of miles. He has traveled in Europe, painted many pictures, published over 200 poems, several dramas, and, among others, the following works: *Description of the Mississippi River*, *Pilgrimage to the Holy Land*, and *The Private Life of a King*.

**BANVILLE, THÉODORE DE**, author of poetical and prose works, born in Moulins, France, in 1820. His first volume, *Les Caryatides*, was published in 1841; other of his writings are: *Rimes Dorées*, *Les Érites*, *Les Occidentales*, *Trent-six Ballades Joyeuses*, *Les Stalactites*, *Esquisses Parisiennes*, *Contes pour les Femmes*, *Comédies*, *Odes Funambulesques*, *Petit Traité Poésie de Française*, *Contes Fleriques*, and *Mes Souvenirs*. See *Britannica*, Vol. XIV, p. 206.

**BANYULS-SUR-MER**, a town of France, in the Pyrenees Orientales, with a fishing port on the Mediterranean. The celebrated wines of Grenache and Rancio are produced in its vicinity. Near the town are four old towers, one of which marks the division between France and Spain. This place was the immediate scene of many encounters between French republicans and Spaniards during the first French Revolution.

**BANYUMAS**, a town in Java, at the opening of a large valley on the left bank of the Serajo. See *Britannica*, Vol. XIII, p. 606.

**BANXRING (TUPAIA)**, a squirrel-like, insectivorous mammal, native of Sumatra, Borneo, India and Java.

**BAOUR-LORMIAN, PIERRE MARIE FRANÇOIS LOUIS**, a poet and translator, born at Toulouse, France, on March 4, 1770, and died in 1857. He

translated Tasso and Ossian, and wrote several tragedies.

**BAPAUME**, a fortified town of France, department of Pas-de-Calais. A portion of the allied troops advanced to this place after compelling the French to abandon their fortified position, and to retreat behind the Scarpe in 1793.

**BAPTISTS, CANADIAN, GERMAN, SEVENTH-DAY.** See **RELIGIOUS DENOMINATIONS**, in these Revisions and Additions.

**BAQUOY, JEAN CHARLES**, an engraver of Paris, France, born in 1721, died in 1777.

**BAQUOY, PIERRE CHARLES**, son of the preceding, born in 1759, died in 1829. He was a French engraver, whose best work is *Martyrdom of St. Gervais and St. Protas*.

**BAR**, any elongated piece of wood, metal, or other solid substance. In the iron manufacture, bar is a rod either round or square shaped. The round ones are made by passing the iron red-hot through a bore or hole in a plate, and the square ones by passing it likewise red-hot through a roller-mill between two rollers counter-grooved, with their triangular-grooved faces forming the square opening of the passage of the iron.

**BAR**, a bank opposite the mouth of a river formed when the larger body of water arrests the current of the tributary and compels it to deposit the mud and sand which it has brought, near its own mouth. A bar soon forms a delta, as in the cases of the Mississippi and Nile rivers.

**BAR**, in music, the space between two perpendicular lines drawn across the staff dividing it into equal measures of time.

**BAR**, or **BARR**, in heraldry, one of those more important figures known as *ordinaries*. The "honorable ordinaries" are commonly reckoned as ten in number, the sub-ordinaries, or minor charges, being much more numerous. The bar, like the fess, is formed by two horizontal lines passing over the shield; but it differs from it in size, the fess occupying a third, the bar only a fifth part of the shield.

**BAR**, a Russian town where the nobility of Poland formed a confederation to counteract the Russian influence over their king, Stanislas Augustus. The same year, 1768, the Russian army captured Bar and exiled the confederates. They declared the king dethroned and took him to Warsaw. After four years of fighting Russia suppressed this revolution.

**BAR, DE AIMÉ FLEURY**, a French general, born at Thiers in 1783, died in 1861. He served in the wars of Napoleon I, again in Algiers, and was made lieutenant-general and later a senator.

**BARABOO**, city of Wisconsin, county-seat of Sauk county, situated on a railroad and the Baraboo River; iron mining, grain, fruit and hop-raising are carried on.

**BARACOA**, a seaport town on the northeast coast of Cuba, belonging to the Spaniards. In its vicinity is a remarkable mountain called the Anvil of Baracoa.

**BARADA**, a Syrian river, which flows through the city of Damascus. Before reaching the city it divides into two branches; these are thought to be the Abana and Pharpar of the Bible.

**BARAGA, FREDERICK**, a devoted Roman Catholic bishop, born in Treffen, Austria-Hungary, June 29 1797, died at Marquette, Mich., Jan. 19, 1868. He came to the United States and devoted his life to work among the Indians, laboring among the Ottawas of Michigan, and the Chippewas at La Pointe. His work was attended with great hardship, but he did not spare himself, and he died in the midst of his labors. He wrote works of devotion in the

Selavonic dialect; a prayer and hymn-book in the Ottawa language, also one in the Ojibway dialect; the *History, Character, Manners and Customs of the North American Indian* (in German); and a grammar and dictionary of the Chippewa language.

**BARAGUAY D'HILLIERS**, Louis, a distinguished general of the French Empire, born in Paris in 1764. He received an appointment in the army of Italy from Napoleon, and was a sharer in all the campaigns of 1796-97. He was made a general of division, and in virtue of Napoleon's treaty with the Venetian Republic, May 16, 1797, commandant of Venice. He accompanied the expedition to Egypt, and afterwards successively held appointments in the armies of the Rhine, the Tyrol, and in Catalonia. He headed a division in the Russian campaign of 1812, but on the retreat he incurred the displeasure of Napoleon. He was sent as governor to Berlin, where he died from grief and exhaustion.

**BARATARIA BAY**, an inlet of the Gulf of Mexico in Louisiana, connecting the Mississippi River and the Bayou la Fourche. Fort Livingston was erected in 1840-50 on the west end of Grande Terre Island, at the bay's entrance.

**BARB** (probably derived from Barbary), a breed of horses originated among the Moors and introduced into Spain. The thoroughbred horse of the present doubtless descended from the Barb. "Godolphin Arabian" was an animal of this breed. In New Jersey the name barb is applied to the kingfisher.

**BARBADOES CHERRY**, the name given in the West Indies to the fruit of two small trees, *Malpighia urens* and *Malpighia glabra*, which are cultivated for its sake. Clusters of fruit are produced from the axils of the leaves.

**BARBADOES GOOSEBERRY** (*Pereskia aculeata*), a pleasant West Indian fruit, produced by a plant of the natural order *Cactaceæ*, with a round stem, thick flat alternate leaves, and large strong spines. The fruit has expectorant properties.

**BARBADOES TAR**, a dark, inflammable liquid which, by distillation, yields naphtha, with asphalt as a residuum.

**BARBARA**, SAINT, who suffered martyrdom at Nicomedia, in Bithynia, about 236, or, according to other accounts, at Heliopolis in Egypt, about 306, was of good birth, and well educated by her father, Dioscorus. To avoid disturbance in her studies he had a tower built for her, where she spent her youth in the deepest solitude. While in this retirement she was led, through Origen, it is said, to embrace Christianity. Her father, a fanatic heathen, learning of his daughter's conversion, and failing to induce her to renounce Christ, delivered her up to the governor, Martianus, to be dealt with by the law. Martianus, struck with the intelligence and beauty of the maiden, attempted first by arguments to make her relinquish Christianity, but when that failed he had recourse to the most exquisite tortures. At last the father offered himself to strike off his daughter's head. Scarcely was the deed done when he was struck by lightning. Hence Saint Barbara is to this day prayed to in storms. For the same reason she is the patron saint of artillery, and her image was at one time frequently placed on arsenals, powder-magazines, etc. The powder-room in a French ship of war is to this day called *Sainte-Barbe*.

**BARBAROUX**, CHARLES, one of the most distinguished and energetic of the Girondists, born at Marseilles in 1767. The new ideas of equality and fraternity found in him a warm advocate, and he did much to promote their spread. He was elected special delegate of Marseilles to attend the

constituent assembly at Paris. He returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the convention. While there he adhered to the Girondists, and boldly opposed the party of Marat and Robespierre. In May, 1793, he was proscribed as a royalist and an enemy to the Republic. He wandered about the country, hiding himself as he best could, but he was finally taken and perished at Bordeaux by the guillotine, June 25, 1794. He understood the revolutionary crisis much better than most of his party, and had they all generally possessed anything like his energy and sagacity, much bloodshed and horror would have been spared to France.

**BARBED AND CRESTED**, heraldic terms by which the comb and gills of a cock are designated when it is necessary to particularize them as being of a different tincture from the body. The common English term is *Wattled and Crested*.

**BARBEL**, the common English name of several species of cyprinoid fishes, particularly the *Barbus vulgaris* of the rivers of the temperate parts of Europe. It is abundant in the Thames, Weser, Elbe and Rhine. The barbel of the Nile sometimes weighs seventy pounds. It is not found in American waters.

**BARBER'S ITCH**, the name given to two diseases. (1.) When there is a pustular eruption caused by too close or frequent shaving. (2.) When there is ringworm in the hair of the beard caused by using unclean or contaminated razors, etc. The disease can be cured by perfect cleanliness and the use of soothing ointments if the difficulty is not of a very serious nature.

**BARBERRY**, a shrub of a genus (*Berberis*) of plants of the natural order *Berberideæ*. All the species, which are numerous, and found in temperate climates in most parts of the world, except in Australia, are shrubs with yellow flowers having a calyx of six leaves, a corolla of six petals, and six stamens, which, when touched at the base, display a considerable degree of irritability, starting up from their ordinary position of reclining upon the petals, and closing upon the pistil, apparently a provision to secure fecundation. The fruit is a berry with two or three seeds. Many of the species are evergreen. The common barberry (*Berberis vulgaris*), a native of most of the temperate parts of Europe, Asia and North America, produces its flowers and fruit in pendulous racemes. Some of the evergreen species are employed for hedge plants, as *Berberis dulcis*, the Sweet Barberry, a native of the southwest coast of America.

**BARBERTON**, a town of the Transvaal, about 300 miles north of Durban. It is named after a prospector of the De Kaap gold-fields, and is the headquarters of the new mining industry of that region. See *Britannica*, Vol. XXIII, p. 518.

**BARBÈS**, ARMAND, a French revolutionist, born in Guadeloupe, Sept. 18, 1809, died at The Hague, June 26, 1870. On charges which were not substantiated he was imprisoned from 1834 to 1835, again from 1839 to 1848, and for a term of several years following 1848.

**BARBESIEU** N. DE LOUIS FRANÇOIS LE TELLIER, marquis, born at Paris in 1668, died in 1701. He was minister of state during the reign of Louis XIV.

**BARBET**, a variety of poodle-dog which is very intelligent, faithful to its master, cross with strangers, and quite liable to disease.

**BARBON**, a French family of famous printers who lived in the 16th century. John Barbon, of Lyons, was the head of the family, and from his press came the handsome edition of Clement

Marot's works. Hugh Barbon brought out the celebrated edition of *Cicero's Letters to Atticus*. Joseph Gerald Barbon published a continuation of the series of Latin classics in duodecimo. In the British Museum there is a complete set of the Barbon classics.

**BARBOURSVILLE** (Cabell Court-house), West Virginia, the county-seat of Cabell county, situated on the Guyandotte River and the Chesapeake and Ohio Railroad. A normal school is in the town. On July 13, 1861, the Federal troops fought a battle here with the Southern army, in which the former were victorious.

**BARBY**, a walled town of Prussian Saxony, on the left bank of the Elbe, 15 miles southeast of Magdeburg. It is well built and has an old castle. Population, 5,600, chiefly engaged in the manufacture of woollens and linens.

**BARCAROLLE**, a species of song peculiar to the gondoliers of Venice. The name is also applied to musical compositions for voice or piano-forte of a similar character.

**BARD**, a fortress and village of Piedmont, situated on the left bank of the Doire, about 23 miles south-southeast of Aosta. When the French crossed the St. Bernard in 1800, the fortress of Bard offered a resistance to their farther advance into Italy, which might have proved effectual had the Austrian garrison been sufficiently on the alert. The French failed to take the fortress by storm, but they succeeded in dragging their artillery under and past the guns of the fort during the night, and were far on the road to Ivrea before the Austrian commander was aware that they had passed. Bard was taken a short time after by the French, and destroyed, but has since been restored. Population, about 600.

**BARDINGS**, or **BARD**, the name of the horse armor used during the Middle Ages. It was in four pieces: one to protect the face and head; one for the neck; one for the shoulders and chest; one from the cantle of the saddle to the tail. A horse thus protected with armor was called "harded."

**BARDSTOWN**, county-seat of Nelson county, Ky., and the southeastern terminus of a branch of the Louisville and Nashville Railroad. It contains churches, an orphan asylum, an academy, St. Joseph's Seminary and College (Catholic), and a female college; it also has flouring mills and distilleries.

**BARBONE'S PARLIAMENT**, so called from one of its members, Praise-God Barbon, or Barbone, was a gathering of 139 persons who met at the summons of Oliver Cromwell, July 4, 1653, and is known as the "Little Parliament." They were to be "faithful, fearing God and hating covetousness;" but their work did not prove to be conducive to the welfare of the country, and they were allowed to resign in December of the same year. See *Britannica*, Vol. VI, p. 602.

**BARFOOTED FRIARS** and **NUNS**: The name of an order of Roman Catholic monks and nuns, who wear sandals or go barefooted.

**BARÉGES**, mixed tissues adapted for women's dresses, called in France *Crêpe-de-Baréges*. Baréges were first manufactured at Bagnères de Bigorre. They are usually a mixture of silk and worsted, an inferior kind being composed of cotton and worsted.

They vary in color and are sometimes light in tint, with printed patterns. All are of a slight fabric for summer wear.

**BAREGINE**. Many algae are found growing in mineral springs, especially those of a sulphuric nature. The product of their growth is a mucus-like substance, somewhat resembling the white or glair of an egg. This deposit is particularly abundant in the hot springs at Baréges, from which baregine derives its name. It imparts a flesh broth flavor and odor to the water, which is prized, and is sometimes imitated by adding animal gelatine to the sulphur-baths where baregine is deficient.

**BARENTS**, WILLIAM, a celebrated Dutch navigator of the 16th century. He made a number of voyages toward the North Pole. He discovered the islands of Spitzbergen while endeavoring to find a northeast passage to India. Barents Sea is named after this intrepid explorer. He died in 1597, while on a voyage of exploration. Parts of his journal have recently been found by members of different expeditions to the Polar regions. See *Britannica*, Vol. X, p. 184; also XIX, 317.

**BARFOD**, PAUL-FREDERIC, a distinguished Danish poet and publicist, born in 1811. His principal work is *Narratives from the History of the Fatherland*. His style is charming, and all his writings, which are numerous, are very popular in Denmark.

**BARGA PASS**, a mountain pass among the Himalayas, situated in the Punjab, in the northern portion of Bashahr state. Its highest point is 15,000 feet above the sea-level. Not a mile from it there are two other and more elevated passes.

**BARGAIN AND SALE**, to be effective, under the State laws, severally, of the United States, must be attended either by the immediate payment of a part or the whole of the price, or by the transfer of the personal possession of the property involved. See *SALE*, *Britannica*, Vol. XXI, pp. 205-10; also under *REAL ESTATE*, Vol. XX, p. 308.

**BARGE**. Two uses of this name are peculiar to the United States. It commonly denotes a double-deck passenger or freight boat, having no motive power of its own, but intended to be attached by a hawser to a tow-boat. Such a boat is used either for the transportation of bulky produce, such as hay and straw, or for the carrying of passengers for short distances in smooth water on pleasure excursions. A lapstreak somewhat like a shell, but better adapted to rough water, and used by racing crews while in training, is also known in America as a barge. See *Britannica*, Vol. XXI, p. 30.

**BARGE**, an old town of Piedmont, Italy. It has a college, manufactories of fire arms, and there are slate quarries in the neighborhood. In 1808 the town suffered severely from an earthquake.

**BARGEBOARD**, or **VERGEBOARD**, the board used to cover the place where the roof extends out over a wall. It is generally employed to conceal a rafter and is often made quite ornamental.

**BAR HARBOR**, a famous summer resort in Hancock county, Maine, on the eastern side of Mount Desert Island, on Frenchman's Bay.

**BARLATINSKI**, ALEXANDER IVANOVICH, PRINCE, field-marshal, born in Russia, 1814, died in Geneva, March 9, 1879. He was educated in company with the future Czar, Alexander II, entered the army and became lieutenant-general in 1852. In 1856, Alexander II, having ascended the throne, Barlatinski was placed in charge of the forces in the Caucasus, and after three successful campaigns he stormed Ghunib, and captured Schamyl.

**BARILLA**, or *SODA ASH*, an impure carbonate of soda procured from plants which grow in salt marshes, or other places near the sea; it forms a

BARDED.

considerable article of commerce, being used in the manufacture of soap and of glass, and for other purposes in the arts. The greatest quantities of barilla are produced in Spain and the Balearic Islands. The Canary Islands, Italy and France also contribute a part. The Spanish barilla is most esteemed, especially that produced near Alicante, which is chiefly obtained from the *Salsolusatiea*, a plant of the natural order *Chenopodiaceae*.

BARINAS, name of a province and a city of Venezuela. The province has a fertile soil and many streams. Its chief productions are cacao, coffee, hides and tobacco. Barinas (or Varinas) is the capital of the province.

BARINGO, a lake of Africa northeast of Victoria Nyanza. It lies almost under the equator; is 20 miles long, 3,000 feet above the sea, and though it has several inlets and no outlet its water is fresh.

BARING-GOULD, SABINE, a noted English *littérateur* and divine, born at Exeter in 1831. His early studies embraced a wide range, and he accumulated a vast store of out-of-the-way knowledge, especially of matters pertaining to the Middle Ages. His principal works in this line are: *The Book of Wervolves*; *Post-medieval Preachers*; *Curious Myths of the Middle Ages*; *Curiosities of Old Times*. His numerous writings include many religious and historical works. Of a number of novels his earliest, *Mekalah*, and his *Richard Cable*, are stories of uncommon power.

BARITONE, or BARYTONE, a male voice whose compass partakes of both bass and tenor. It is not so deep as the lowest bass nor so high as tenor. Its range is from lower *G* of the bass clef to lower *F* of the treble.

BARBER, EDMUND HENRY, a well-known English philologist, born in 1788, at Hollym in Yorkshire, died in London, March 21, 1839. He studied at Cambridge. Besides editions of several Latin classics and numerous contributions to periodicals, he was led, during his residence with the famous philologist Parr, to undertake a revision of Stephens's *Thesaurus Lingua Graeca*. This work was violently assailed by Bloomfield, against whom he wrote his *Aristarchus Anti-Bloomfieldianus*. He assisted Professor Dunbar in the compilation of the Greek and English Lexicon, published in 1813.

BARBER, GEORGE FREDERIC, physicist, born in Charlestown, Mass., July 14, 1835. He was assistant professor of chemistry at Yale and Harvard, of natural philosophy at Wheaton (Ill.) College, and of chemistry at the Albany Medical College. In 1873 he had the chair of physics at the University of Pennsylvania. He was a delegate to the International Congress of Electricians held in Paris in 1881, and a commissioner of the United States at the International electrical exhibition held at the same time, and received from the French government the decoration of the Legion of Honor with the rank of commander.

BARBER, JACOB, financier, born in Maine in 1779, died in Philadelphia in 1871. During his business career he made and lost several fortunes, having early entered a commission house in New York and engaged in the shipping business and in speculations in oil. His last fortune, accumulated in New Orleans, where he had established himself in 1834, was swept away by the civil war. He was one of the originators of the Tammany society, and was elected a State senator. In an insurance case he delivered a legal opinion, when sitting in the court of errors, opposed to that of Chancellor Kent, which was sustained on appeal. He was accused of fraud in connection with the failure of an insurance company, and conducted his own defense with much ability. The indictment was quashed on a new

trial, though Mr. Barker had been at first found guilty.

BARKER, JOSIAH, born in Marshfield, Mass., Nov. 16, 1763; died in Charlestown, Mass., Sept. 23, 1843. He was a ship-builder, and in 1810 the government made him naval constructor. He built the ships *Virginia*, *Warren*, *Cumberland*, and other war-vessels.

BARLAAM, a bishop who lived in the fourteenth century. He pursued his studies at Thessalonica and then went to Constantinople, where he changed from the Roman Catholic to the Greek religion. He was made abbot of St. Salvador, but on his return to Italy he adopted the Roman Catholic faith and was given the bishopric of Gieraci in the kingdom of Naples.

BARLE-DUC, a town in France 125 miles east of Paris by railroad. It has a public library, a communal college, a normal school, manufactories of cotton-goods and hosiery, and an extensive trade in timber, wines, iron and wood.

BARLEYBREAK, or BARLEYBRAKE, a popular game, very common in the reign of James I. and with certain modifications in name and practice still played by young persons in England and Scotland. The game consisted in one person chasing the rest around the stacks in a farm-yard, and when one was caught he or she had to assist in capturing the rest. The origin of the name is doubtful. Dr. Jamieson suggests that, in Scotland, the locality of the game may have given it its name.

BARLEYCORN, JOHN, a personification of barley as the source of malt-liquor or whiskey, used jocularly, and also in humorous poetical effusions. There exists a whimsical English tract of old date, under the title of *The Arraigning and Indicting of Sir John Barleycorn, Knt., Printed for Timothy Tossplot*, in which Sir John is described as of "noble blood," well beloved in England, and a maintainer of both the rich and the poor.

BARLOW, FRANCIS CHANNING, born at Brooklyn, N. Y., Oct. 19, 1834. He was a soldier in the civil war, who left his law practice and editorial work on the "New York Tribune" to enter the army. He fought at Fair Oaks, Antietam, Chancellorsville, Gettysburg, Spottsylvania and Petersburg, distinguishing himself for bravery and receiving the title of brigadier-general. After the war he was Secretary of State of New York (1865-1868); was appointed by President Grant U. S. marshal of the southern district of the State, and 1872-73 was attorney-general of the State.

BARLOW, JOHN, an author and diplomatist, born at Redding, Conn., March 24, 1754, died in Poland, near Cracow, Dec. 21, 1812. After graduating from Yale he spent some time in the army as chaplain. He then took up law and started the paper "American Mercury." He edited the *Book of Psalms*, wrote the famous *Vision of Columbus*, resided in London for two years, where he wrote *Advice to the Privileged Orders*. He lived for some time in France, and was sent by the United States on important missions to Algiers, and to France, on the last of which he died while attempting to reach Napoleon, then retreating from Russia.

BARMECIDE'S FEAST, an "Arabian Nights" tale, which is as follows: Shacabac, a beggar, for two days had had nothing to eat, so determined to visit Barmecide, a noble of Persia, and ask for food. He did so, and found the hospitable Barmecide already at his dining table, which was covered with empty dishes. In a humorous mood the Barmecide offered his guest several dishes, one after another, asking how he liked the rice soup, the bread and the meat? Shacabac entered into the spirit of the joke and pretended to eat, praising mean-

time the different viands. The host at the conclusion of the imaginary feast offered wine, but after refusing to drink, saying in excuse that he had already eaten too much, Shacabac took an empty glass and drank an imaginary bumper. In high good-humor the host urged him to drink again, but the guest averred he was quarrelsome when in liquor. The host insisted, so the poor man drank, and to confirm his words struck his host a smart blow across the face, for which he apologized profusely. The Barmecide was satisfied with the joke, and then had his guest served with a substantial repast.

**BARMOUTH**, a picturesque watering-place of Wales at the mouth of the Maw river. On the opposite side of the river is the mountain Cader Idris.

**BARNACLE**. See **DISTRIBUTION**, Britannica, Vol. VII, p. 279. Mr. Huxley (*Anat. Invert.*) mentions the barnacle as a "crustacean fixed by its head, and kicking the food into its mouth with its legs." Properly, the term denotes the *Lepas anatifera*, a stalked cirriped of the family *Lepadidae*; but in the United States the name is used also—sometimes exclusively—of a sessile cirriped, as the *Balanus*, commonly called sea-acorn, or acorn shell. Barnacles are often found attached in great numbers to the bottoms of sea-going vessels; the sessile *Balanus* adhering closely in colonies, the pedunculated *Lepadidae* hanging in large clusters.

**BARNACLE**, or **BARNACLE GOOSE**, a species of wild goose, of the genus *Bernicla*, found in northern Europe, and sometimes in America. It is related to the brent-geese and to the common wild goose, but is somewhat smaller. It was represented in the fables of former times as having derived its origin from the cirriped called the barnacle, which was popularly supposed to be the fruit of a tree growing by the sea-shore.

**BARNARD, LADY ANNE**, eldest daughter of James Lindsay, fifth earl of Balcarres, born in Scotland 1750, died in London May 6, 1825. She married Andrew Barnard, colonial secretary to Lord Macartney at Cape of Good Hope, who died in 1807. She was the author of *And Robin Gray* in 1772, but did not acknowledge its authorship till 1823.

**BARNARD, CHARLES**, author, born in Boston, Mass., Feb. 13, 1838. He was successively a clerk, a theological student, a florist and a journalist. He has been editor of "Vox Humana," and assistant editor of the Boston "Journal of Commerce," "Boston Post," and editor of "World's Work Department" in the "Century." He has written many short stories, and among his published books are *My Ten-Rod Farm*; *The Soprano*; and *Knights of Today*. He writes "Talks About the Weather," "Talks About Our Useful Plants," and similar articles for the "Chautauqua Circle." He is also a writer of operas and dramas.

**BARNARD, FREDERICK AUGUSTUS PORTER**, a famous educator, born in Sheffield, Mass., May 5, 1809, died in New York city, April 27, 1889. He was educated at Yale and taught there, afterwards going as instructor to the Hartford Asylum for the deaf and dumb. He took orders in the Episcopal church, and about the same time, 1854, occupied the chairs of mathematics, natural philosophy and chemistry in the University of Alabama. From 1856 to 1861 he was president of this University. Upon the outbreak of the civil war he resigned his position and came North. In 1864 he was called to the presidency of Columbia College, and this position he held for the remainder of his life. He was sent as United States commissioner to the universal exposition in Paris, 1867. In 1878 he went on a similar mission to the exposition held in the same city. He

was a member of the Labrador expedition sent out in 1860 to observe the sun's eclipse. Several colleges conferred degrees upon him. He was president of the American Association for the Advancement of Science, and of the American Institute. He wrote many reports, essays, and books. His principal works are: *Treatise on Arithmetic*; *Analytic Grammar with Symbolic Illustration* (for use in schools for the deaf and dumb); *Letters on Collegiate Government*; *History of the U. S. Coast Survey*, and *The Metric System*. He was one of the original corporators of the National Academy of Sciences. His best work was done at Columbia College, whose usefulness and strength he greatly increased. He was interested in the higher education of women, and provided in his will for an annex to Columbia—the Barnard College for Women.

**BARNARD, HENRY**, born at Hartford, Conn., Jan. 4, 1811. He graduated at Yale and became a lawyer; in 1837 he was elected to the legislature, where he was active in instituting prison and asylum reforms. He started high schools, teachers' institutes, a normal academy and reorganized the public school system. He was secretary of the board of school commissioners in Connecticut, school commissioner of Rhode Island, president of the University of Wisconsin, and later of St. John's College at Annapolis. He has been a voluminous writer on educational subjects, and in 1886 made a collection of his publications, which comprised 52 volumes. From 1867 to 1870 he held the important office of U. S. commissioner of education.

**BARNARD, JONAS GOSS**, brother of Frederick A. P. Barnard, born in Sheffield, Mass., May 19, 1815, died at Detroit, May 14, 1882. He was a soldier, and graduated at West Point. He was engaged in engineering on the Gulf coast, at the Pensacola and the New Orleans fortifications. After the Mexican war, in which he saw service, he was sent to survey the isthmus of Tehuantepec in the interest of the proposed railroad from ocean to ocean. In 1855 he was superintendent of the West Point military academy. During the war he had important engineering commissions to fulfill. General Barnard was not only a brave soldier, but was also an author and mathematician. He wrote *Survey of the Isthmus of Tehuantepec*, *Dangers and Defenses of New York*, *Eulogy of General Totten*, and other works.

**BARNARDO, THOMAS J. F. R. C. S. E.**, a philanthropist of England, who lived in the nineteenth century. He was the founder of homes for destitute children. Dr. Barnardo in 1887 reclaimed 10,000 children of the street and placed them in charitable institutions. Under his charge are 33 institutions, which include an immigrant depot in Ontario, a home for babies, and an industrial farm in Manitoba.

**BARNBURNERS**, a nickname for one of the two factions into which the Democratic party of New York was divided about the year 1848. Some of the leaders of this faction were Col. Samuel Young, Michael Hoffman, and Honorable Silas Wright. The Barnburners were opposed to the extension of the canal system, extension of slavery in the Territories, and to public debts, corporate privileges, etc. The Barnburners, after a few years, were incorporated with the Free-soil party. The faction opposed to them was called "Hunkers." The story of the farmer who burned his barn in order to kill his rats is the source of the nickname Barnburners.

**BARNEGAT BAY**, New Jersey, a body of water 23 miles long, in Ocean county, connected with the Atlantic by an inlet one mile wide, and separated from the ocean by the low islands, called Squan Beach and Island Beach. A tall light-house stands on the south side of the inlet.

BARNES, DANIEL HENRY, born at Canaan, N. Y., April 25, 1785, died near Troy, N. Y., Oct. 27, 1828. He was a graduate of Union College, and his first position after leaving his studies was in the Poughkeepsie Academy. He became a Baptist and was licensed to preach. In Schenectady he had charge of a classical school, which was connected with his *Alma Mater*. President Francis Wayland, Bishop Alonzo Potter and Dr. Erskine Mason were among his pupils. He was professor of languages in the New York Baptist Theological Seminary. A little later he started what proved to be a very successful English and classical school in the same city. He was chosen president of Waterville College in Maine, but declined the honor. He was a philologist, conchologist, and eminent classical scholar; he wrote much on geology, and assisted Dr. Webster in compiling his dictionary.

BARNES, THOMAS, born in 1786, died in 1841. He was educated at Christ's Hospital, London, and Pembroke College, Cambridge. For twenty years he was editor of the "London Times."

BARNES, WILLIAM, an eminent divine, philologist, and perhaps the first of English purely pastoral poets; born in Dorsetshire in 1800, died in 1886. His poetical world was the secluded vale of Blackmore, and its humble inhabitants, with all their quaintness and humor, are photographed with charming artistic truth. His collected poems were published, in 1879, as *Poems of Rural Life in the Dorset Dialect*. Among his philological works, many of which were very valuable, was an attempt to teach English in purely English words, which has been characterized, from his use of such terms as "time-takings" for tenses, "mark-words of suchness" for adjectives, as making large demands upon the reader's patience. His life, written by his daughter, appeared in 1887. See *Britannica*, Vol. VII, p. 372.

BARNESVILLE, a village of Georgia, about sixty miles south of Atlanta, is the seat of the Gordon Institute, and contains also an excellent high school.

BARNESVILLE, a manufacturing town of Ohio, about thirty miles west of Wheeling. It is finely situated as the center of an extensive agricultural district, noted especially for its strawberries. It is the seat of Olney College.

BARNETT, JOHN, English musician and composer, born in 1802, died in 1890. He wrote, besides other operas, *The Mountain Sylph*, *Fair Rosamond*, and *Farinelli*. His nephew, John Francis Barnett, born in 1838, has composed *The Ancient Mariner*, a cantata, *Paradise and the Peri*, *The Raising of Lazarus*, *The Lay of the Last Minstrel*, and *The Good Shepherd*.

BARNEY, JOSHUA, a naval officer, born in Baltimore, Md., July 6, 1759, died at Pittsburg, Pa., Dec. 1, 1818. He was made lieutenant for bravery on the schooner *Wasp*. He was three times taken prisoner by the English, but exchanged. After having captured the *Charming Molly*, he was twice taken a prisoner, but escaped from jail. He was given a ship, and sent to clear the Delaware of British privateers. He captured the *General Monk*, an 18-gun ship, and for this was voted a sword by the Pennsylvania legislature. During the war of 1812 he was assigned to the defense of Washington, and here he was made prisoner by the English for the seventh time. In 1815 he was sent on a mission to Europe, but ill-health compelled his return. His declining years were spent on a farm.

BARNFIELD, RICHARD, born at Norbury, England, in 1574, died at Stone, Staffordshire, in 1627. He was educated at Brasenose College, Oxford, and wrote three volumes of poetry. His verse is quaint but over-luxuriant. The ode, *As it Fell upon a*

*Day*, and the sonnet, *If Musique and Sweet Poetrie Agree*, were for a long time attributed to Shakespeare.

BARN OWL, or CHURCH OWL, is the common white owl, of which the American variety is the *Aluco pratincola*. Other varieties are found in nearly all the temperate regions of the earth, constituting together the family *Alucidae*. They are carnivorous, and are valuable as destroyers of mice. See *Britannica*, Vol. XVIII, pp. 88-91.

BARNUM, PHINEAS TAYLOR, the well-known public showman, born at Bethel, Conn., July 5, 1810. In his youth he was clerk in a country store, and then agent for a lottery company. In 1829 he started the unsuccessful newspaper "Herald of Freedom." He came across Joyce Keth, a colored woman, the reputed nurse of Gen. Washington, and said to be 160 years old. He bought her, and by his shrewdness as a showman earned considerable money. Within a year the woman died, and Mr. Barnum traveled south with small shows, wrote for newspapers, sold Bibles, exhibited negro dancers, and finally purchased Scudder's American Museum in New York. Here he exhibited a woolly horse, a white negress, a Japanese mermaid and Charles S. Stratton (the famous General Tom Thumb). His greatest venture was made in regard to Jenny Lind; he offered her \$1,000 a night for 150 nights. For these concerts he netted \$350,000. So great was the enthusiasm caused by Mr. Barnum's advertising that \$650 is said to have been paid for a single ticket. He built his residence at Bridgeport, Connecticut, in imitation of the Brighton Pavilion, and encouraged business enterprises in the town, laid out streets and planted trees. A clock manufacturing company which came to Bridgeport through his influence involved him financially, but he paid his creditors and built up another fortune by exhibiting Gen. Tom Thumb in England and by delivering lectures. Mr. Barnum has twice suffered loss by having his museum burned. He established a traveling menagerie and museum, which he called "The Greatest Show on Earth." The elephant "Jumbo" was one of his greatest "cards." Mr. Barnum has four times been a member of the Connecticut State legislature, has been mayor of Bridgeport, has delivered numerous lectures on temperance and practical affairs, has written his autobiography (an interesting and amusing account of his struggles and artifices), and has given liberally to benevolent objects, one of his gifts being a museum building for Tufts College, near Boston. Died April 7, 1891.

BAROACH, name of a district and its capital in British India. A large trade is carried on in grain, cotton and seeds. In the city there is a Brahminical hospital for all kinds of sick animals, even insects being received.

BAROMETRIC LIGHT, the name given the luminous appearance which is seen when the mercury of a barometer is shaken or moved through a space of a few inches; the Torricellian vacuum becomes light because of the frictional electricity generated by the mercury against the glass. The experiment is most successful when performed in the dark and in frosty weather.

BAROMETZ, or TARTARIAN or SCYTHIAN LAMB, the prostrate stem (rhizome) of a fern (*Cibotium barometz*) which grows in the salt plains near the Caspian Sea. It is shaggy with a silky down, and has a sort of general resemblance to an animal. In the days of ignorant credulity, when the story of the phoenix was received as a truth of natural history, and barnacles were believed to grow into geese, and horse's hairs into eels, marvelous tales were told of the barometz, which was supposed to

partake of the nature of a plant and of an animal; to grow on a stalk and eat grass like a lamb.

**BARON, BERNARD**, born in Paris, 1700, died in London, 1762. He was a distinguished engraver and a pupil of Nicolas Henri Tardieu.

**BARON, MICHAEL**, born at Paris, Oct. 8, 1653, died Dec. 3, 1729. He was the son of a leather merchant and a handsome actress. Molière early became his friend and instructor. Baron was very handsome, and became famous as a writer of plays and an actor.

**BARON, PIERRE**, known as Peter Baro, born at Étampes, France, and died in London, 1596. On account of his Protestantism he had to leave France for England. Here he was appointed to the chair of divinity in Cambridge. Opposed to Calvinism, and very outspoken as to his views, he met with great opposition and was accused of heresy and a desire to lead the church back to Rome. He was at last obliged to resign his office and spent the latter part of his life in retirement.

**BARON OF BEEF**, a large piece of beef, consisting of both sides of the back, or double sirloin, and weighing, according to the size of the animal, from 50 to 100 pounds. The term probably originated in a fanciful allusion to the word *sir-loin*, inasmuch as *baron* is the superior title.

**BAROTSE**, a central branch of the Bantu family of African negroes, living in a valley of the Upper Yambesi, which river floods the Barotse valley, rendering it very fertile.

**BAROZZIO DA, GIACOMO**, a famous Italian architect, sometimes called Vignola, born at Vignola, in Modena, in 1507, died in Rome in 1573. He studied painting at Bologna, but subsequently turned his attention to architecture at Rome. He designed the palace of Cardinal Farnese (Caprarola), and at the death of Michel Angelo became architect of St. Peter's. The Escorial Palace in Madrid was designed by him. He left several works on architecture; *Regole de Cinque Ordini d'Architettura* is still a standard authority.

**BARQUE**, or **BARK**, a name frequently given to ships, but with no very definite meaning. Sometimes it denotes simply a ship of small size, but more technically it applies to three-masted vessels, whose mizzen-sails are fore and aft instead of being square.

BARQUE.

**BARR, AMELIA EDITH**, born at Ulverton, Lancashire, England, March 29, 1831. Her father was Rev. William Huddleston. She was educated at Glasgow, and in 1850 married Robert, son of Rev. John Barr, a pastor of the Scottish Free Kirk. In 1851 the family came to the United States and resided in Austin, Texas, and later in Galveston. In 1869, after the death of her husband and three sons she brought her three daughters to New York, where she became a governess, but after two years she began to write for newspapers sketches which were well appreciated. Her first book, *Romance and Reality*, was followed by *Scottish Sketches*, *Jan Yedder's Wife*, *A Daughter of Fife*, *A Bow of Orange Ribbon*, and other novels.

**BARR, or BARRA**, a small kingdom of Mandingo, in western Africa. Its area is about 750 square miles. The surface is somewhat marshy, but fertile and well cultivated.

**BARRA MANSA**, a Brazilian town on the Parahiba River, 70 miles northwest of Rio Janeiro.

**BARRACUDA**, a large fish of the perch family, found in the Atlantic Ocean. It is very voracious, and its length is from 6 to 10 feet. Its flesh is poisonous at certain seasons of the year. The scientific name of this fish is *Sphyrna plicata*.

**BARRAFRANCA**, a town of Sicily, in the district of Piazza, about 10 miles southeast of Caltanissetta. Population of about 6,100.

**BARRANQUILLA**, the chief port of the United States of Colombia, situated on the Magdalena River, 15 miles from the place where it enters the Caribbean Sea. A bar at the river's mouth has hindered ocean steamers from entering the port of Barranquilla, but this has been partially removed. The inland trade is very extensive and largely controlled by Germans.

**BARRANTES, VINCENTE**, a Spanish author, born at Badajoz, March 29, 1829. He wrote dramatic pieces, political satires, ballads and stories. He was the author of a historical work on the Philippine Islands.

**BARRATRY**, the offense of inciting and stirring up quarrels. One act of this kind is not sufficient to maintain an indictment for the offense, but it must be shown that the party accused frequently, or at least on more than one occasion, conducted himself in the way imputed. Therefore the principle of the law appears to strike at the habit or disposition of evil-minded persons who would incite to quarreling, or busy-bodies, as they are in fact called in the old law reports. In the law of Scotland barratry is defined as the crime committed by a judge who barter justice for money. There is also barratry of mariners, which signifies the fraud of the master or mariners of a ship tending to their own advantage, but to the prejudice of the owners.

**BARRE**, a manufacturing village of Worcester county, Mass., in Barre township. It has an institution for feeble-minded children. The township is intersected by Ware River, and has a station on the Ware River Railroad.

**BARRE**, a village of Washington county, Vermont. It has a school called Goddard Seminary. The township of the same name has a granite quarry, and manufactories of agricultural tools, woolen goods, ice-tools, etc.

**BARRE, DE LA ANTOINE LE FÈVRE**, a French naval officer, died May 4, 1688; was governor of Guiana in 1663, and of Canada, 1682-85.

**BARREL**, a large cylindrical vessel primarily used for holding liquids. It is now a measure for various quantities. In the United States and in England the barrel-measure differs. In the former place a barrel may denote a certain weight. Thus a barrel of flour is understood to be 196 pounds; beef, pork, fish or salt, 200 pounds. A barrel is supposed to contain 31½ gallons (wet measure), or 3¼ bushels (dry measure), although the bushel-measure varies in different States.

**BARREL ORGAN**, a cylinder or barrel, turned by a crank, fitted on the inside with pegs which, as the handle is turned, opens valves admitting currents of air to pipes, and thus harmonious sounds are produced. Instead of pipes wires are sometimes used. Barrel organs are used by street-musicians, and cost from \$100 to \$300, according to the size.

**BARREN ISLAND**, a small volcanic island 8,500 yards in diameter, lying in the Bay of Bengal, east of the Andaman Islands.

**BARRETT, BENJAMIN FISK**, born at Dresden, Maine, June 24, 1808. In 1832 he graduated at Bowdoin and six years later at the Cambridge Unitarian Seminary, where he became a convert to the doctrines of Swedenborg. He preached in New York and Cincinnati till 1860, when, his health fail-

ing, he gave up pulpit work and engaged in mercantile business in Chicago, and four years later was made pastor of the New Church Society in Philadelphia. He wrote many books on the doctrines of the New Church.

**BARRETT, LAWRENCE**, born at Paterson, N. J., April 4, 1838, died in New York city, March 20, 1891. He first appeared as an actor at Detroit in 1853, and subsequently at Pittsburg, St. Louis and Chicago, and at New York city in 1856. He supported such actors as Edwin Booth and Charlotte Cushman. He played in Boston after this, but at the opening of the civil war he volunteered, serving as a captain in the 28th Massachusetts. He played at Philadelphia, Washington, and then at New York. Here he began acting Iago to Booth's Othello. For the next few years he was engaged in acting, studying the literature of the stage, and managing different theaters. Since about 1864 he has been a star actor. He has played much with Booth in opposite characters. Mr. Barrett has written a life of Edwin Forrest.

**BARRIAS, FELIX JOSEPH**, an eminent French historical painter, born in Paris in 1822. His picture of *Eheta*, exhibited at Philadelphia in 1876, attracted considerable attention. His principal work is a series in the chapel of St. Genevieve in Paris, illustrating incidents in the life of that saint.

**BARRICADES**, hastily constructed fortifications made to obstruct the progress of an enemy, or to serve as a defense. They may be built of earth, trees, wagons, paving-stones, or any material at hand.

**BARRIER ACT**, that which was passed by the general assembly of the Church of Scotland, Jan. 8, 1697, according to the provisions of which no change could be made in the laws of the church without first referring such proposed change to all the presbyteries and getting a majority vote in its favor. This act is held of much importance both by the free and the established church of Scotland.

**BARRIÈRE, JEAN FRANÇOIS**, a writer of France, born in 1786, died 1868. With Berville he edited a valuable book for historical reference, *Mémoires Relatifs à la Révolution Française*. He wrote *Mémoires Relatifs au XVIII<sup>ème</sup> Siècle*.

**BARRIERE, THEODORE**, a French dramatist, born at Paris in 1823, died Oct. 16, 1877. He wrote *Les Faux Bonhommes*, *Cadavillon* and *Le Démon de Jeu*.

**BARRIER REEF**, a coral reef, about 300 miles in length, extending along the northeast coast of Australia, and being from 10 to 18 miles distant from the shore.

**BARRIER TREATIES**, the name of several treaties concluded between England and foreign powers. The first treaty, which was made in 1709, was between the Dutch and English, the former agreeing to maintain the English queen's title and the Protestant succession; the English at the same time to help the Dutch preserve their border towns. In 1713, at Utrecht, a similar treaty was concluded between the English and Dutch. In 1715 a third treaty was signed at Antwerp between England, the Netherlands and the Emperor Charles VII.

**BARRING OUT**, a custom that formerly prevailed in English schools and consisted in the scholars taking possession of the school room and fastening the doors against the master, at whose helplessness they scoffed from the windows. The usual time for barring out was immediately prior to the periodical vacation. It seems to have been a rule, understood in barring out, that if the scholars could sustain a siege against the master for three days, they were entitled to dictate terms to him regarding the number of holidays, hours of recreation, etc., for the ensuing year.

**BARRINGTON, HON. DAINES**, an English jurist and naturalist, who attained considerable distinction. He died in 1800. Two of his best known works are *Dissertation on the Linnaean System*, and *Observations upon the Statutes, Chiefly the More Ancient, from Magna Charta to the 21 Jac. I, c. 27*.

**BARRINGTON, GEORGE**, a thief and an author, the son of a silversmith named Henry Waldon. He was born at Maynooth, Ireland, in 1755. While a youth he ran away from school and went to London. Here he became a pickpocket, one of his crimes being the robbing of Prince Orloff of a snuff-box set with diamonds, valued at \$150,000. In 1790 he was sentenced to transportation to Botany Bay, but on the voyage he revealed a conspiracy among the convicts, and was rewarded in 1792 by having his sentence commuted. At Paramatta, New South Wales, he became superintendent of the convicts, and high constable. He wrote *A Voyage to Botany Bay*, *The History of New South Wales*, and *The History of New Holland*.

**BARRINGTONIA CÆE**, a natural order of exogenous trees and shrubs, natives of tropical countries, and generally very beautiful both in foliage and flowers. This order is sometimes included in *Myrtaceæ*. The stamens are very numerous, and form a conspicuous part of the flower. The fruit is fleshy with bony seeds lodged in pulps. The *Moordilla* (*Barringtonia speciosa*) is described as a tree which much attracts the attention of travelers in Ceylon. It has dark glossy leaves, and crimson-tipped white flowers. Fruits of *Gustavia speciosa* give a yellow hue to children who eat them.

**BARRIOS, JUSTO RUFINO**, a statesman of Central America, born at Guatemala, July 17, 1835, died at Chalchuapa, April 2, 1885. He studied law, but in 1867 took part in the revolutionary struggles then going on in his country. It was largely through his efforts on the battlefield that the régime established by Carrera (the "thirty years") was put to an end, and General Garcia Granados made president. As chief of the army, Barrios was called to put down two insurrections, and in 1873 he was elected president of Guatemala. His administration was marked by revolution and by an attempt to assassinate him. In 1880 the Republic, having framed a liberal constitution, reelected General Barrios to the six years' presidency. After considerable trouble the question of boundary between Mexico and Guatemala was settled and General Barrios made a tour through Europe and the United States. On his return he endeavored to consummate a union of all the Central American States (1885); but while the proposition met with favor in Guatemala, Salvador took exceptions and war ensued. General Barrios' troops met with their accustomed success till they entered Chalchuapa, where the bullet of a sharpshooter killed General Barrios. His army was panic stricken at the calamity and fled. General Barrios has been accused of harsh measures and cruelty, but no doubt his enemies overestimated his defects. He was a good organizer, equipped his soldiers better than any others in Central America, and kept them in good drill. He made Guatemala a clean, pleasant city, established a police force, introduced the telegraph and railroad, built bridges, founded schools, and did much for the upbuilding of his native land.

**BARRIQUE**, an ancient French measure of Bordeaux, equal to 228 liters.

**BARROSA**, a village of Spain, sixteen miles south-southeast of Cadiz, celebrated in history as the place where General Graham, in 1811, with a handful of English troops, succeeded in gaining over the French, after his Spanish allies had retreated.

one of the most glorious victories of the peninsular campaign. More than 2,000 French were killed, 300 prisoners taken, six pieces of cannon, and an eagle—the first captured in the war.

**BARROT, CAMILLE HYACINTHE ODILON**, a French jurist and statesman, born at Villefort, Lozere, in 1791, died in 1873. In 1814 he became an advocate in the Court of Cassation, Paris, and soon acquired a high reputation as an eloquent pleader. At the Revolution of 1830 he was one of the three commissioners appointed by the provisional government to accompany Charles X from Rambouillet to Cherbourg. Under the new government he was appointed prefect of the department of the Seine, but resigned this office in a few months, and declined the post of ambassador at Constantinople, offered by Louis Philippe. He took a conspicuous part in the reform movement of 1847, and attended several of the provincial reformed banquets which led to the revolution of 1848. He retired from political life in 1851.

**BARROW**, a river of Ireland, next in importance to the Shannon. Its head is in Queen's county, and its course is south and west as it flows toward the Atlantic. Near New Ross the Nore and Suir rivers join it, and they are called "The Three Sisters." The mouth of the Barrow, called Waterford harbor, is nine miles long. The river is 100 miles long and navigable for about sixty-five miles.

**BARROWE, HENRY**, an English lawyer, who was attracted by the teachings of John Greenwood, who preached against the Roman Catholics and Puritans. Barrowe, who had led a wild life, joined in the religious crusade for independency. Being arrested in 1586 on the charge of publishing seditious books, he was for the remainder of his life confined in the Fleet prison, and only taken thence to be hanged with John Greenwood, April 6, 1593.

**BARRUNDIA, JOSÉ FRANCISCO**, born at Guatemala, Central America, about 1780, died at New York, Aug. 4, 1854. He headed the revolutionary party in its struggle for independence, and in 1829 was made president of the Republic. He wrote a narrative of the Central American history, and in 1852 was called again to the presidency, but declined, as three out of the five republics had seceded. With the view of again gaining popularity in Guatemala he went to the United States as minister from Honduras, but died on the mission.

**BARRY**, the name in heraldry given to a shield, which is divided into bars. The divisions are four, six or some even number. *Barry-bendy* is where the shield is divided by lines drawn barwise and bendwise. *Barry-pily* is where the shield is divided bar-wise and diagonally.

**BARRY**, a small island in the Bristol Channel, twelve miles southwest of Cardiff. It has the ruins of an ancient castle and two chapels.

**BARRY, MARTIN**, an eminent English physician, born at Fratton, 1802, died at Beccles, in April, 1855. He was educated in the London medical schools and Edinburgh University. He was a voluminous writer, especially on animal development and embryology, in which departments he made important discoveries.

**BARRY, DU MARIE JEANNE GOMARD DE VAUBERNIER**, Countess, born Aug. 9, 1746. She was mistress of Louis XV of France, and exerted great political influence. She suffered death by the guillotine during the reign of Terror, Dec. 3, 1793.

**BARRYTON**, a musical instrument now obsolete, called in Italian *viola di bardone*. It has six or seven gut-strings, while under the neck are strings of brass, 16 in number, which are played with the thumb. A bow is used on the gut-strings.

**BART, or BARTH, JEAN**, a French naval officer, famous for his bold exploits. He fought against the Dutch in a privateer, and for his daring exploits was made commander of a squadron as well as captain in the royal navy. He died April 27, 1702.

**BARTER**, the exchange of one commodity for another, instead of the sale of a commodity for money. In new or barbarous countries trade is generally carried on by barter.

**BARTII**, a seaport town of Prussia, at the mouth of the Barth River.

**BARTHELEMY SAINT-HILAIRE, JULES**, a learned Frenchman, born 1805. A member of the Institute, formerly a representative of the people. During 1828-1830 he was one of the editors of the "Globe," a Paris paper. In 1833 he desisted from political strife, and betook himself to more quiet pursuits, and in 1838 was professor of Greek and Latin philosophy in *Collège de France*. His principal writings are his translations of Aristotle's works.

**BARTHOLDI, FREDERIC AUGUSTE**, a French sculptor, born in Alsace-Lorraine, April 2, 1834. He studied painting in Paris under Ary Scheffer, but gave this up to devote himself to sculpture. He executed the La Fayette statue in New York city, the *Lion of Belfort*, *Giref*, and the famous light-house statue, *Liberty Enlightening the World*, which was presented, at his suggestion, to the United States government by the French people. This bronze statue is itself 152 feet 2 inches high, and is placed on a pedestal 177 feet 9 inches high, on Bedloe's Island in New York harbor, where it was unveiled Oct. 28, 1886. It is a triumph of technical skill. Bartholdi has been made commander of the Legion of Honor.

**BARTHOLIN, CASPER**, born at Malmö, Sweden, in 1585, died July 13, 1629. He was a precocious youth, and pursued his studies at the University of Copenhagen, and at Rostock and Wittenberg. He wrote medical works, and was professor of medicine and of divinity.

**BARTHOLIN, THOMAS**, an eminent physician, born in Copenhagen, Oct. 20, 1616, died at Hagsted, Dec. 4, 1680. He was professor of anatomy in his native city, and wrote a treatise on the liver, the lymphatic vessels (which he claimed to have discovered), and a book called *Anatomia*.

**BARTHOLOMEW, EDWARD SHEFFIELD**, a sculptor of Connecticut, born 1822, died at Naples, May 2, 1858. He first practiced dentistry, but soon turned his attention to the study of painting and sculpture, in which latter branch he won distinction. Some of his works are *Blind Homer led by His Daughter*, *Eve, Youth and Old Age*, *Eve Repentant*, and *Ganymede*.

**BARTHOLOMEW FAIR**, an annual festival held at West Smithfield, London. The charter for the fair was granted by Henry I, to his jester, a monk named Rafer, who founded the St. Bartholomew church and priory. The charter was granted in 1133, and the fair, which was a great merry-making, opened each year on Aug. 24 (old style). The visitors engaged in all sorts of sports, contests and trading. The fair was held several days, but it at length became a nuisance, and in 1850 was abolished.

**BARTIZAN**, a small overhanging closet or turret built over doorways or on the corners of buildings. Bartizans were made for defense, and had small loopholes or windows, but in modern architecture they are only added for ornament.

**BARTLETT, JOHN RUSSELL**, born at Providence, R. I., Oct. 23, 1805, died May 28, 1886. In early life he was in the banking busi-

BARTIZAN.

ness, but abandoned it to enter the book-importing trade. He was corresponding secretary of the American Historical Society, a member of the American Ethnological Society, one of the commissioners appointed to fix the boundary between Mexico and the United States, and was Secretary of State for Rhode Island for 17 years. Among his books are *The Progress of Ethnology*, *A Dictionary of Americanisms*, *Literature of the Rebellion*, and *Primeral Man*.

BARTLETT, JOSEPH, an adventurer, born at Plymouth, Mass., June 10, 1762, died at Boston, Oct. 20, 1827. He graduated at Harvard, and after studying law went to England, where he fell in with a gambling set of young men. Having lost his money and been sent to jail, he earned his release by play-writing. He was by turns an actor, importer, soldier (in Shays' rebellion), lawyer, and a member of the Maine legislature. He delivered an original poem, "Physiognomy," at a meeting of the Harvard Phi Beta Kappa Society, and at a Fourth of July celebration at Boston recited a poem entitled "The New Vicar of Bray," which became famous. In 1805 he edited the "Freeman's Friend."

BARTLETT, JOSIAH, M. D., an American patriot and statesman and first Governor of New Hampshire, born at Amesbury, Mass., Nov. 21, 1729, died May 19, 1795. He studied and practiced medicine, becoming eminent in the profession by his discovery and appliance of new remedies. In 1765 he was delegate to the legislature. From this time onward he was in public office. He was a zealous Whig notwithstanding the efforts of the British government to secure his fealty. As a member of the Continental Congress he was the first to vote for the Declaration of Independence and the second to sign it. Dr. Bartlett was appointed general naval agent (1776), was elected to Congress (1778), was successively chief justice of the court of common pleas, muster master of troops, justice of the superior court, chief justice, three times chosen president of New Hampshire, and the governorship was his last office.

BARTLETT, THOMAS, a noted sculptor, born in Vermont in 1835. *The Angel of Life*, *Wisdom*, and *The Wounded Drummer Boy* are among his principal works.

BARTLETT, WILLIAM HENRY, an artist and popular writer, born in London in 1809, died in 1854. He was a pupil of Britton, the architect, who afterwards employed him to make drawings for his *Cathedral Antiquities* and *Pictureque Antiquities of English Cities*. He visited America several times and traveled in Europe and in the Holy Land, enriching his portfolio with innumerable interesting scenes. There were devoted to these countries no less than 19 quarto volumes, containing about 1,000 engravings from his sketches, and letter-press from his own pen and those of his fellow-travelers, Dr. W. Beattie, N. P. Willis and Miss Pardoe. He died on a voyage from Malta to Marseilles.

BARTOL, CYRUS AUGUSTUS, a clergyman, born at Freeport, Maine, April 30, 1813. He graduated at Bowdoin and at Cambridge divinity school. In 1837 he was made assistant pastor of the West Church (Unitarian) of Boston. He has written several religious works.

BARTOLI, DANIELLO, a scholarly Jesuit, born at Ferrara in 1608, died at Rome in 1685. He was rector of the Jesuit College at Rome.

BARTOLI, PIETRO SANTO, a painter and a skillful etcher, born 1635, died 1700.

BARTOLI, TADDEO, an Italian painter, who lived between 1362 and 1422. He belonged to the Siennese school.

BARTOLOMEO, SAN, a town of Naples, in the province of Capitanata. Population, 5,450.

BARTON, ANDREW, a Scotch naval commander under James IV. He lost his life in an engagement on the Downs, Aug. 2, 1541.

BARTON, BERNARD, an English poet, born in London, Jan. 31, 1784, died in 1849. His parents were members of the Society of Friends, to whose tenets Barton adhered through life. In 1810 he became clerk in a banking house at Woodbridge, in which situation he continued until within two years of his death. His first poetical efforts were published in 1812, under the title of *Metrical Effusions*, which brought him in correspondence with the poet Southey. *Poems by An Amateur*, and *Poems* (1820), increased his reputation and gained him the friendship of Lamb and Byron. After his death, which took place suddenly, his daughter published *Selections from the Poems and Letters of Bernard Barton*.

BARTON, BENJAMIN SMITH, born at Lancaster, Pa., Feb. 10, 1766, died at Philadelphia, Dec. 19, 1815. He studied at York, Pa., in Philadelphia, Edinburgh and London. He became a physician, and settled in Philadelphia. He held a professorship in the University of Pennsylvania, and was a member of different American and European societies. He wrote articles for journals and published books on botany and other subjects.

BARTON, CLARA, born in Oxford, Mass., about 1830. In 1851 she entered the Patent Office as a clerk, having previously been a successful teacher in Bordentown, N. J. When the war broke out she resigned her clerkship and devoted herself to the care of the wounded soldiers, and in 1864 was at the front as superintendent of the hospitals in the Army of the James. On the conclusion of the war she conducted a search for missing soldiers of the Union armies, and at Andersonville identified and marked many graves of Union prisoners. She has since done good service abroad in her chosen line of work, aiding efficiently the Red Cross society during the Franco-German war, and when the American Red Cross society was organized, in 1881, became its first president. See RED CROSS SOCIETIES, in these Revisions and Additions.

BARTON, THOMAS PENNANT, born at Philadelphia in 1803, died April 5, 1869. He was the son of Dr. Benj. S. Barton. He was a man of literary taste and had a fine library, which included 2,000 rare editions of Shakespeare, and which he bequeathed to the Boston Public Library.

BARTON BEDS, a strata of sand and clay included in the Bagshot beds.

BARTON-ON-HUMBER, an ancient town in North Lincolnshire, England, formerly one of the important ports of the Humber River. The most important articles of production are ropes, sack, pottery, tiles, brick and whiting. Quarries in the vicinity yield chalk and oolite. One of the objects of interest is St. Peter's Church, built about the time of the Conquest.

BARTON'S BUTTONS (also called Iris Ornaments). Mr. John Barton succeeded, by means of a dividing engine, in engraving on steel and similar surfaces lines which were distant from one another only two ten-thousandths of an inch. Steel dies thus marked with hair lines are used to stamp buttons and articles of ornament. These, when stamped, reflect the colors of the rainbow.

BARTRAM, JONAS, born near Darby, Pa., March 23, 1699, died at Kingsessing, Pa., Sept. 22, 1777. He acquired an extensive knowledge of medicine, surgery and botany. Linnæus called him the "greatest natural botanist in the world." On the Schuylkill River, at the place called Kingsessing, he laid out a botanical garden, which was the

first of the kind in America. He traveled to make botanical collections, wrote accounts of his excursions, and received the honorable appointment of American botanist to George III.

**BARTRAM**, WILLIAM, son of the preceding, born at Kingessing, Pa., Feb. 9, 1739, died at the same place July 22, 1823. He was a botanist and traveled in the eastern States, making scientific collections. For several years he raised indigo on the St. John's River in Florida. He published books descriptive of his travels, was connected with scientific societies, made a very complete list of native birds, and illustrated Barton's *Elements of Botany*.

**BARTSCH**, JOHANN ADAM BERNHARD, a German engraver, born in Vienna, Aug. 17, 1757, died there Aug. 21, 1821. He wrote *The Painter-Engraver*.

**BARU**, a fine, woolly substance, found at the base of the leaves of the *Saguerus saccharifer*, one of the most valuable sago-palms of the Indian archipelago. It is used for caulking ships, for stuffing cushions, and for other similar purposes.

**BARYE**, ANTOINE LOUIS, born in Paris, Sept. 24, 1795, died June 25, 1875. He served in the army in 1812-14, and afterward took up drawing and modeling. His teachers were Bosio and Baron. He became especially famous for his statuettes of animals, some of which are to be seen in the art galleries of New York and Baltimore. He received the cross of the Legion of Honor.

**BAS**, or **BARTZ**, a small island in the English Channel, belonging to France, situated off the north coast of the department of Finisterre. It is about three miles in length and two in breadth, on an elevation 223 feet above the sea, and is defended by two forts and batteries. It has a light-house, and a population of about 1,200, whose chief occupation is fishing.

**BASALT**, a volcanic rock of feldspar and hornblende, or augite. It is a variety of trap-rock, of conchoidal fracture, compact in texture, and either black or dark green or gray in color. Its characteristic columnar structure, as seen at the Giant's Causeway and at Fingal's Cave, is remarkable. See *Britannica*, Vol. X, p. 235.

**BASCOM**, HENRY BRIDLEMAN, an eloquent bishop of the Methodist Episcopal Church, South, born at Hancock, N. Y., May 27, 1796, died in Louisville, Ky., Sept. 8, 1850. He was licensed to preach when in his nineteenth year. His first work was done in Ohio, on the frontier, where he suffered many hardships. Subsequently he preached in Tennessee and Kentucky. He was appointed chaplain to Congress, and later he accepted the presidency of Madison College, Uniontown, Pa. He was called to the presidency of four different colleges—three calls coming at the same time. He was a delegate to several important Methodist conventions, and became editor of the "Southern Methodist Quarterly Review." The works of Bishop Bascom have been edited by Rev. T. N. Ralston.

**BASCOM**, JONAS, born at Genoa, N. Y., May 1, 1827. He graduated at Williams College and at Andover Theological Seminary; was tutor and also professor at Williams. While teaching here he was pastor of a church in Vermont. In 1874 he was called to be president of the Wisconsin University.

**BASE**: in heraldry, the lower part of the shield. Dexter, middle and sinister base mean, respectively, the left corner, middle and right lower corners.

**BASE**: in architecture, the lowest part of a wall, or that part on which a pillar or shaft rests. The Doric column is the only one having no base. As

BASE.

a usual thing the base is half the lower diameter of the shaft. The base has two parts, the plinth and the molding. The former is a flat, square block on which the molding (generally circular in shape) rests. See **COLUMN**, in these Revisions and Additions.

**BASE**, or **BASS**, in music is the deepest or lowest part, by whatever instrument it may be performed. The base next to the upper part is most striking, the freest in its movements, and richest in effect. In respect to harmony the base is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed the most important and effective figure in music, called "organ point." Base is also the name of the lowest and deepest quality of the human voice. It only begins to show itself at the years of manhood, and is generally a change from the alto voice of a boy. Base is also an old stringed instrument, with from five to six strings, played with a bow. Double base (contra-bass) is the deepest toned of stringed instruments.

**BASE BALL**, a game which has become so popular in the United States that it has won the title of "The National Game." It was probably named from the bases used in making the runs, which constitute one of its prominent features. The origin of the game is a matter of dispute. Some contend that it was evolved from the old game of "rounders," known to the boys of England, and adduce in support of their theory the coupling of base ball with cricket by Jane Austen in Northanger Abbey. Others maintain that it is a development of the school-boy game of "one old cat," in which there were a pitcher, a catcher and a batter. For the early history of base ball, with diagram, description and early rules of the game, see *Britannica*, Vol. III, pp. 406-7.

The National Association of Base Ball Players was organized March 10, 1858. The first contest for the championship took place the same year at the Elysian Fields, Hoboken, N. J. As early as 1806 base ball had become so popular that on Oct. 1 of that year 30,000 people gathered to witness the championship game to be played in Philadelphia; and so dense was the crowd that the players were unable to proceed, and the contest was postponed. In 1871 the National gave place to the Professional Association, which was organized March 17; and the employment of paid players became a recognized feature of the conduct of the championship matches. This association was superseded by the National League, organized Feb. 2, 1876. From the date of its formation to the present writing, 1891, twenty-three cities have had representative clubs in the National League. The International Association, representing professional clubs in the United States and Canada, was formed Feb. 20, 1877. A similar association, bearing the same name and composed of seceders from the International League, was formed in 1887. The International League was formed in 1886, by the union of the clubs of the New York State League and those of Toronto and Hamilton; it was known temporarily during 1888-1889 as the International Association. The National Association, made up of eastern professionals, was in existence from 1879 to 1881. The National League Alliance was formed in 1877. The Eastern Championship Association was organized in 1881. The American Association was formed Nov. 2, 1881. The Northwestern League was organized Jan. 2, 1879. The Western League in 1886. The Western Association, Oct. 28, 1887. The Inter-State Association, Nov. 9, 1882. The Union Association existed from 1883 to 1885. The Eastern League was in existence for about four years following

Sept. 25, 1883. The Southern League began in 1885, and lasted three years. The New England League, following the short-lived Eastern and Southern N. E. leagues, was organized in 1885 and continued in existence three seasons. The Central League was formed in 1887. The Atlantic Association succeeded the New England and Central leagues in 1889. The brief existence, during 1890, of the Players' League is memorable in base ball circles on account of the spirited contests between that organization and the National League, from which it had been formed, and with which, after much controversy, it was reunited. Among the minor professional leagues are the Ontario, Central Inter-State, Tri-state, Middle States or Inter-State, North Pacific, and the various distinctive associations named from their respective States. The principal amateur associations are those composed of students of the various colleges from which they are severally named.

The trip of the American base ball players to England in 1874 is noted in *Britannica*, Vol. III, p. 406. Fourteen games of base ball were played between the Boston and Philadelphia clubs. Seven games of cricket, the national game of Great Britain, were also played with the best elevens in the principal cities of England and Ireland, in all of which the Americans met with easy and uninterrupted success. Other trips abroad by American players have been two to Havana, in 1879 and 1886, and a tour around the world in 1888-89. The Chicago club and a picked team known, as the All America, accompanied by newspaper correspondents and others, left Chicago Oct. 20, for San Francisco, Honolulu, Auckland, Sydney, Melbourne, and other principal cities of Australia, Colombo in Ceylon, the Pyramids of Egypt, Brindisi, Naples, Rome, Florence, Paris, London, Bristol, Manchester, Liverpool, Birmingham, Glasgow, Belfast, Dublin, Queenstown, New York, Philadelphia, and Chicago, arriving April 20, having made the trip in just six months and played fifty-three games.

Of "best-on-record" performances, the largest number of innings played is 24, by Harvard *vs.* Manchester, at Boston, May 11, 1877. The quickest game was played in 47 minutes by Dayton *vs.* Iron-ton, at Dayton, Sept. 19, 1884. The largest number of games played by a club during any season is 188, by the Detroit club, March 11 to Oct. 26, 1887. The largest number of games played by an individual player is 184, by S. L. Thompson, of the same club during the same season. For the honor of having thrown a ball the greatest distance there are several claimants. The recorded distance is 400 feet 7½ inches, by John Hatfield, at Brooklyn, Oct. 15, 1872. It is claimed, however, that a ball was thrown 406 feet ½ inch by Ed. Crane, at Cincinnati, Oct. 12, 1884; and another 402 feet 2½ inches by H. Vaughn, at Buffalo, June 23, 1890. The official count of the aggregate number of spectators at the games of the national and players' leagues during the season of 1890 is 1,794,565.

**BASE OF OPERATIONS**, in military tactics, the spot on which the commander-in-chief relies for his magazine or stronghold. It is not only the source of supplies, but also the place where the sick and wounded are sent, and where the army falls back when pressed by the enemy.

**BASECOURT** (*Basse Cour*), the outer court of a feudal mansion, which contained the stable-yard and accommodation for servants. It was distinct from the principal quadrangle, and was sometimes constructed of timber.

**BASEDOW**, JOHANN BERNHARD, a German educational reformer, born in Hamburg, Sept. 11, 1723, died in Magdeburg, July 25, 1790. He sought to

realize the ideas of Rousseau. He founded at Dessau, in 1774, a model school, which he called *Philanthropin*. He endeavored to awaken a sentiment of cosmopolitanism and to popularize learning. His numerous works drew attention to, and aroused interest in, the subject of education and set in circulation many good ideas.

**BASENOW'S DISEASE**, or **GRAVES' DISEASE**, or *Exophthalmic Goitre*, a disease more frequent among women than among men. Its characteristic symptoms are enlarged thyroid gland, prominent eye-balls and palpitation. Patients usually recover from this difficulty, as its remedies are gentle exercise, nourishing food and chalybeates.

**BASELLA**, a genus of plants belonging to the natural order *Chenopodiaceæ*. The species are all tropical. They have twining stems, in common use as pot herbs in the East Indies, and are cultivated in China. In the neighborhood of Paris they are raised in hot beds, transplanted into warm borders, and furnish a substitute for spinach in the summer. *Basella rubra* yields a very rich purple dye. The great fleshy root of *Basella tuberosa*, a South American species, is edible.

**BASHAHR**, one of the Punjab hill states on the lower slopes of the Himalayas. The province has an area of 3,320 square miles. The river Sutlej flows through it from east to west. The people are of the Hindoo race.

**BASHAW** (Turkish, *bashç*; Arabic, *basha*; Persian, *pasha*, the way in which the word is now generally written), signifies head, or master, a Turkish title of honor given to the viceroys, provincial governors, generals, and other distinguished public men. The term bashaw is also used to characterize a man of an arrogant and domineering disposition.

**BASHEE**, or **BASHI ISLANDS**, a small cluster in the line between Luzon, the chief of the Philippine chain, and Formosa, in lat. 21° N. and long. 122° east. They are a dependency of the Philippines, having been colonized by the Spaniards in 1783, and they form a link in the vast archipelago which, from Formosa to Sumatra, inclusive, connects the southeast of China with the west of Malacca. They were discovered in 1687 by Dampier, who called them Bashi Islands on account of the popularity among the islanders of an intoxicating liquor of that name.

**BASHI-BAZOUKS**, irregular troopers in the pay of the Sultan. They are mostly Asiatics, from some of the pashalics in Asiatic Turkey. They are wild, turbulent men, ready to enter the Sultan's service under some leader whom they can understand, and still more ready to plunder whenever an opportunity offers.

**BASIDOLH**, or **BASSADORE**, a village at the west end of the Island of Kishim. It has a hospital and a bazaar.

**BASILENTO**, or **BASENTO**, a river of Italy, which, rising in the Apennines, west of Potenza, flows in an east-south-east direction through the province of Basilicata to the Gulf of Taranto. Near its mouth are the remains of the once-famous city of Metapontum, where Pythagoras ended his days.

**BASIL**, a name given to several herbs of the natural order *Labiata*. The species are all natives of the tropics, or of the warmer temperate parts of the world, and are generally characterized by a pleasant aromatic smell and taste. Cultivated for culinary purposes, being used as seasoning.

**BASILEAN MANUSCRIPT**, the name given to two Greek manuscripts of the New Testament. One is a nearly complete copy of the Gospels written at Constantinople, about the eighth century; the other a copy of the whole New Testament, which must have been written in the tenth century.

These valuable manuscripts are in the library at Bâle.

**BASILIAN MANUSCRIPT**, a manuscript of the Apocalypse, now in the Vatican, which manuscript derives its name from the Basilian monastery in Rome, where it formerly belonged. It is written in uncial characters and is of the eighth century.

**BASILIAN MONKS**, or **MONKS** of **ST. BASIL**, a religious order originated in the year 363 by Saint Basil the Great. His system was approved by the Pope. Monasteries of this order are found in Italy, Spain, Asia Minor and other countries.

**BASILICON**, a name given to an ointment composed of yellow wax, black pitch, resin and olive oil. These materials are melted together over a slow fire, and the mixture while hot is strained through linen. Basilicon ointment is used as a gently stimulant application to blistered surfaces, indolent ulcers, burns, scalds and chilblains.

**BASILICON DORON**, a celebrated prose work of King James VI. of Scotland, written for the instruction of his son, Prince Henry. It consists of three books. The first treats "Of a King's Christian Duty Toward God;" the second, "Of a King's Duty in His Office;" and the third, "Of a King's Behavior in Indifferent Things." It was first published in 1599. It has been translated into Latin and French, and is now considered a literary curiosity. See *Britannica*, Vol. XIII, p. 558; XXI, p. 509.

**BASILISCUS**, an emperor of the East, who died about 477. He was a brother of Verina, the wife of Leo I. The latter sent him with an armed force against the Vandal Genserik, who conquered him. In the year 474 he endeavored to usurp the throne, but Zeno defeated him.

**BASIM**, or **BASSIM**, a town of India, situated in a very populous and fertile district of the province of Berar. It is 413 miles northeast of Bombay.

**BASIN**, a geographical term, meaning the tract of land drained by a river. The hills or mountains dividing one river basin from another are called water-sheds.

**BASIN**, in geology, the term applied to a depression in the strata in which beds of a later age have been deposited.

**BASKING SHARK**, the popular name given to a species of shark (*Selache maxima*) on account of its fondness for reposing on the surface of the water in the sun. Bone-shark, sail-fish, sun-fish, or hoe-mother are other vernacular names for this fish. Several barrels of oil are sometimes obtained from the liver of a single shark of this species. See *Britannica*, Vol. XII, p. 646; Vol. XXI, p. 777.

**BASRA**, **BASSORAH**, **BALSORA**, or **BUSSORAH**, a town of Asiatic Turkey, on the west bank of the Euphrates, 70 miles from the Persian Gulf. The river at Basra divides into several channels, and ships can sail from the gulf to the city, making it a place of considerable commercial importance. The climate is unhealthy, and the houses are mostly low huts. It was a place of great importance a few centuries ago, and the Turks and Persians had many conflicts to decide as to its ownership.

**BASS**, or **BASSWOOD** (corruption of the Danish and German word *bast*, meaning inner bark), the linden or lime tree, common in the United States. Its leaves are serrate and nearly heart-shaped; it bears a woody, one-celled nut, and its blossoms furnish abundant honey for bees. The wood is soft and light, of little use for fuel, but valued for carriage making. The bark of the ornamental basswood, *Tilia heterophylla*, is common in the southern and western parts of the United States, and frequently grows to a great size and height. See *LIME*, or *LINDEN*, *Britannica*, Vol. XIV, p. 648; Vol. XIII, p. 808.

**BASS**, the name of a food fish, originally called perch. There are many species, for which some of the popular names are black bass, calico bass (spotted variety found in the St. Lawrence), channel bass, grass bass (*Centrarchus hexacanthus*), Oswego bass, red bass (*Labrax rufus*), rock bass (*Centrarchus æneus*), sea bass, striped bass, and white bass (*Labrax albidus*). This fish is found in fresh or salt water, and in or near the countries of Europe and North America. The name of the typical fish is *Labrax lujus*.

**BASS**, **MICHAEL THOMAS** (1799-1884), a famous English brewer. He was very wealthy, and used his money for many benevolent purposes.

**BASSADORE**, the principal station on the Persian Gulf for British ships. It is at the western end of the island of Kishm.

**BASSE-CHANTANTE**: in music, the higher of the two basses in a score, partaking of more melody, and performed by the violoncello.

**BASSE-CONTRAÎTE**, a French term in music, meaning a bass melody of a few bars repeated throughout the piece, while other parts vary.

**BASSEIN**, a city of India, situated in a district of the same name and on the left bank of a branch of the Irrawaddy. It commands the navigation of the river, and is in the possession of the English. Also a ruined town in the presidency of Bombay, situated on an island of the same name.

**BASSES**, two ledges of rocks to the southeast of Ceylon, distinguished as **GREAT** and **LITTLE**—the former group being more to the southwest, the latter more to the northeast. Their importance arises merely from their position, which is in a great thoroughfare of traffic.

**BASSET HORN** (*Corno di basetto*), the richest and softest of all wind instruments, invented in Passau, in 1770. It is similar to the clarionet in tone and fingering.

**BASSIA**, a genus of plants of the natural order *Sapotaceæ*. The species are trees, tropical or subtropical, the flowers being remarkable for their fleshy corolla, and for the abundance of oil or butyraceous fat which the seeds contain, and which is used for many purposes by the inhabitants of the countries to which they are indigenous. The fruit has a pulpy rind, and three or four one-seeded cells; the ovary has eight cells, but some of them are always abortive. *Pitellaria Lucuma* is highly valued, and forms an important article of internal commerce in the interior of Africa. The seeds of the fruit are dried in the sun, or in an oven, and the kernels are boiled in water, in order to obtain the butter from them, which not only keeps a whole year without salt, but is whiter, more solid and more pleasant to the taste than the butter of cow's milk. It is used both as an article of food and medicine.

**BASSIA LONGIFOLIA**, a native of Coromandel, yields a large quantity of oil, which is used for lamps, soap-making, and sometimes in cookery; the fleshy flowers are eaten and much esteemed. The timber is so hard and durable as to be compared in quality to teak.

**BASSOMPIERRE**, **FRANÇOIS**, **BARON DE**, born at Harnel, Lorraine, in 1579, died in 1646. Belonging to one of the oldest French families, he came at the age of 20 to the French court, where he gained the favor of Henry IV. After the murder of the king he was appointed colonel of the Swiss Guards. In 1622 he was raised to the rank of marshal of France, and took the pass of Suza by storm in 1629. He became an object of suspicion and dislike to Richelieu, who caused him to be cast into the Bastille in 1631, where he remained twelve years. His memoirs, written in the Bastille, are rendered interesting by their spirited style.

**BAST** (or **PHLEUM**), the inner bark of the stems of exogenous plants or trees. In the latter case it is readily distinguished from the wood and the true bark, as it lies between the two. Flax, hemp and jute are made from the bast of certain plants. Ropes, mats and even shoes are made from the inner bark of trees. The linden-tree furnishes the bast for the manufacture of the last three articles mentioned.

**BASTARDY**, another name for illegitimacy. The laws of the several States with regard to bastardy are all founded upon and in most cases similar to those of the English law, fully set forth in *Britannica*, Vol. III, pp. 426-28.

**BASTARDY, DECLARATOR OF**, a suit which may be instituted in the Scotch court of sessions for the purpose of having it declared that the lands or other property belonging to a deceased bastard, belong to a donatory, in virtue of the gift from the crown.

**BASTIAN, ADOLF**, German traveler and anthropologist, born at Bremen, June 26, 1826. He pursued his studies at Berlin, Heidelberg, Prague, Jena and Würzburg. In 1851 he sailed to Australia as ship's doctor, after which he visited North and South America, Europe, Asia and Africa, collecting. In the mean time, a wonderful store of information concerning the history of man. He published thirty works, among which are: *Der Mensch in der Geschichte*, *Die Völker des östlichen Asien*, *Religions-philosophische Probleme*, and *Der Fetische an der Küste Guineas*.

**BASTIAN, HENRY CHARLTON**, English physiologist, born at Truro, Cornwall, in 1837. He was educated at Falmouth and the University College in London, where he became successively professor of pathological anatomy, hospital surgeon and professor of clinical medicine. He is a champion of the spontaneous generation theory. Among his works are: *Modes of Origin of Lowest Organisms*, *Beginnings of Life*, *Evolution*, and *The Brain as an Organ of Mind*.

**BASTIDE, JULES**, a French journalist and politician, born in Paris in 1800. He was minister of foreign affairs in 1848, and member of the constituent assembly. In 1821 he became one of the first members of the French Carbonari; in 1832 was condemned to death, but escaped to London, was pardoned in 1834, and returned to Paris. In 1847 he founded the *Revue Nationale*. During the revolution of 1848 he was minister of foreign affairs.

**BASTIEN-LÉPAGE, JULES**, a French painter born at Damvillers in 1850, died in 1884. Cabanel was his instructor. He painted *In Spring*, *The First Communion*, *The Beggar*, and *Joan of Arc Listening to the Voices*. He was a fine portrait painter.

**BASTINADO**, a name given to the punishment in use over the whole East, which consists in blows with a stick, generally upon the soles of the feet, but sometimes upon the back.

**BASTION** (formerly called bulwark): in fortification, an earthwork or projecting tower, built usually at the corner of a wall surrounding a city. A bastion is generally five-sided; the two sides farthest from the city-wall are called the "flanks;" the two which unite them with the city-wall are called "faces," and the fifth wall is the "gorge;" this connects the two face-walls and joins the curtain-walls. Some bastions are hollow, but military engineers consider solid ones best for defense. The top of the bastion is built sufficiently strong to support heavy guns. Detached bastions are sometimes built opposite the chief angles of a place, and smaller bastions are behind them within the walls.

**BASUTOLAND**, a British crown protectorate in South Africa, adjoining Cape Colony on the north-

east. Area, 10,293 square miles. Population in 1888 (estimated), 180,000. Capital, Maseru, with a population of 660. The Basutos raise immense herds of cattle. White or European settlements are prohibited.

The productions are wool, wheat, mealies, and Kaf-fir corn. There are indications of iron and copper, and coal has been found and is used in some parts, two mines being actively worked for local supply.

Basutoland was annexed to the Cape in August, 1871, but it was placed directly under the authority of the Crown from March 13, 1884.

The territory is now governed by a resident commissioner under the direction of the high commissioner for South Africa, the latter possessing the legislative authority, which is exercised by proclamation.

In 1890 there were 100 schools, chiefly missionary, with 5,042 scholars, the schools receiving a government grant of \$23,170. There are no navigable water-ways, but the roads are good, the postal approaches being through Cape Colony and the Orange Free State. The revenue in 1889 was \$186,050; expenditures, \$174,360; exports, about \$500,000.

**BASUTOS**, a South African race of the great Bantu stock and allied to the Bechuanas. These people belong to the same stock as the Kafirs, but are superior to them in intelligence and inferior in bodily development and warlike energy. The political nation of Basutos originated about 1800. Their second king was Moshesh, who did considerable for his people. He fought the English and Boers for forty years, at the end of which time (1860) the English were victorious. Until 1884 the English had trouble with the newly-acquired territory, but all difficulties were then settled by its becoming an appendage of the British Crown.

**BASYLE**, a name formerly given to a simple and compound substance, which can unite with oxygen to produce a base. Thus all the metals are examples of basyles, and ammonium, ethylemethyle, etc., represent compound basyles. The term now in use is radical, or compound radical.

**BAT**, in military matters, originally the name of a kind of pack-saddle, and so a bat-horse was a baggage-horse bearing a bat or pack.

**BATANGAS**, a seaport town of the Philippine island of Luzon and capital of the province of the same name. Lat. 13° 45' N., long. 121° 5' E., 50 miles south from Manila, founded in 1581. It is well built, has an elegant appearance, is finely situated on an extensive bay, which opens into the Strait of Mindoro. Considerable advantage is taken of its facilities for commerce. Population of town and district, 17,000.

**BATARDEAN**, a strong wall of masonry built across the outer ditch of a fortress to sustain the pressure of water when one part of the ditch is dry and the rest is wet. It is built up to an angle at the top, and is armed with spikes to prevent the enemy from crossing, and sometimes a stone tower is provided to strengthen the defense. There is a sluice-gate to regulate the admission of water.

**BATATAS**, or **SWEET POTATO**, a perennial plant with long creeping stems, heart-shaped leaves on long stalks, and variously lobed large purple flowers much resembling those of the best known species of *Convolvulus*, and very long oblong acuminate tubers. It is a native of the East Indies, but is now cultivated in all tropical and sub-tropical countries for its tubers, which are highly esteemed as an article of food, eaten either roasted or boiled. They are sweet, wholesome and nutritious, but somewhat laxative. It is extensively cultivated in the States bordering on the Atlantic as far north as middle New Jersey, where it is of superior

quality. The plant grows on sandy soils in Georgia and Carolina.

**BATAVI** (sometimes written *Vatavi*), German people who anciently lived in a part of Holland, on or near the island Batavia, which lies between a branch of the Rhine, the Waal River, and Meuse River. They were subjects of Rome, having been conquered by Germanicus, but were allowed many privileges. They were exempt from taxation, but were obliged to furnish soldiers for the Roman wars.

**BATAVIA**, the island inhabited by the Batavi. Batavian Republic was the name given the Netherlands May 16, 1795, and by this they were called till June 5, 1806, when they were made into the kingdom of Holland, under Louis Bonaparte.

**BATAVIA**, a manufacturing town of Illinois, pleasantly situated on Fox River, about seven miles north of Aurora. It contains a private asylum for the insane, known as Bellevue Place, and extensive manufactories of machinery, windmills and paper.

**BATAVIA**, a town of western New York, on the Tonawanda Creek. It has a State institution for the blind, and manufactories of plows, sashes and blinds, and agricultural implements.

**BATCHIAN**, or **BATJAN**, an island of the Dutch East Indies in the Molucca or Spice Islands group. Its area is about 900 square miles; the country is mountainous and fertile. Among the productions are gold, copper, rice and cloves.

**BATENBURG**, one of the Netherlands, in the province of Gelderland, situated on the right bank of the Maese, nine miles west of Nymegen. It is worthy of notice only on account of its association with the Romans, whose *Oppidum Batavorum* it was.

**BATES**, EDWARD, born in Belmont, Va., Sept. 4, 1793, died in St. Louis, Mo., March 25, 1869. After receiving his education he intended to go to sea, but was prevented. He served in the Virginia militia in 1813 and then went to Missouri, where he practiced law. He was made prosecuting attorney for the St. Louis circuit, and then attorney-general of Missouri. In 1822 he was sent to the legislature. In 1850, after having devoted about twenty-five years to the profession of law, he was offered the position of secretary of war by President Fillmore, but declined. At the National Republican convention where Lincoln was nominated for the presidency, Mr. Bates' name received many votes. After Mr. Lincoln's election he chose Mr. Bates for attorney-general.

**BATES**, JOSUA, born at Weymouth, Mass., in 1788, died at London, Sept. 24, 1864. He early showed great business aptitude, and at fifteen entered the counting-house of William Gray & Son, of Boston. In 1812, having been unsuccessful in a business venture with Mr. Beckford, he returned to his old firm and was sent by them to Europe, where he formed acquaintances in the foremost business houses. In 1828 John Baring and himself were taken into the firm of Baring Brothers & Co. When difficulties arose between the United States and England with reference to the war of 1812, Mr. Bates was chosen umpire (1854), and his decisions gave entire satisfaction. Although much of his life was spent in England, yet he kept a kindly feeling for his own country, and in 1854 he gave \$50,000 to the city of Boston to provide for a public library. Afterwards he presented the library with 30,000 volumes.

**BATES**, SAMUEL PENNIMAN, born at Mendon, Mass., Jan. 29, 1827. He graduated at Brown University, and then spent several years in teaching in Massachusetts. His lectures to teachers occasioned the founding of the first normal schools in that section of the State. In 1857 he was called to

Pennsylvania as superintendent of schools in Crawford county. In 1860 he became deputy state superintendent of schools. His writings are mostly on educational subjects. He has published the *Battle of Gettysburg*, *Battle of Chancellorsville* and other historical works.

**BATESVILLE**, a prosperous educational town of Arkansas, county-seat of Independence county, pleasantly situated on the north bank of the White River, about ninety miles north of Little Rock. It contains several flouring mills and woolen mills, and is the seat of Arkansas College, Batesville Academy, and Soulesbury Institute.

**BATH**, the county-seat of Steuben county, N. Y., situated at a railroad junction. It has a court-house, several churches, an orphan asylum, two newspapers and the New York State Soldiers' Home. Population in 1890: village, 3,261; town, 7,881.

**BATH**, a flourishing city of Maine, and county-seat of Sagadahoc county; an important railway center, situated on the Kennebec river 12 miles from its mouth. One of its chief industries is ship-building. See Brit., Vol. III, p. 434. Population in 1890, 8,723.

**BATHOS**, a term employed by critics to designate a ludicrous descent from a lofty thought to a mean one, or sinking below the ordinary level of thought in a ridiculous effort to aspire. It is of the essence of bathos that he who is guilty of it should be unconscious of his fall, and while groveling on the earth should imagine he is still cleaving the heavens.

**BATH STONE**, a building stone extensively used in England on account of its beauty. It is obtained from the quarries in the Lower Oolite in Wiltshire and Somersetshire. The name is derived from the neighborhood of several of the quarries to Bath.

**BATHYBIUS**, a name given by Huxley to the tenacious, slimy masses of so-called animal matter found at certain places along the sea-bottom, usually at a great depth. The name is from two Greek words meaning "deep" and "life," yet it is a matter of much scientific doubt whether Bathybius is a living organism.

**BATHYMETRY**, the art of measuring depths at sea. The greatest depth yet found in the ocean is 4,575 fathoms.

**BATHNOLLES**, a thriving town northeast of Paris, France, of which city it forms a suburb. Population, 43,320.

**BATISTE**, a fine texture of cotton thought to have derived its name either from its original maker, Baptiste, or from its use in drying the foreheads of children after baptism.

**BATLEY**, a manufacturing town of the West Riding of Yorkshire. It has 50 mills and factories, where are manufactured different kinds of heavy woolen cloth, such as army cloth, druggets, etc. The city has a town-hall, over 30 churches, a chamber of commerce, a mechanics' institute and a market place.

**BAT MALTILEA**, a fish of the Atlantic, remarkable for its grotesque shape. Its scientific name is *Maltha respertilio*.

**BATMAN**, the soldier groom of a mounted officer. In the British army officers are allowed a body servant as well as a groom for their horse. During active service the batman takes his place in the ranks. See BAT.

**BATN-EL-HAGAR**, a stony district, along the Nile, in latitude 21°—22° north, and longitude 30°—40°, 31° 10' east. The Nile in the upper portion of the district is often forced by the approaching rocks into a very narrow channel, and its navigation is frequently interrupted by small islands, rocks and cataracts. The district is peopled by Arabs.

**BATON**, the name of a short staff, presented by the sovereign to each field-marshal as a symbol of his newly-bestowed authority. It is also the name of a long staff carried by the drum-major of an infantry regiment.

**BATON ROUGE**, a city of Louisiana, capital of the State, and of East Baton Rouge parish (county), is on the east bank of the Mississippi River, 130 miles above New Orleans. From 1847 to 1864 it was the State capital, when it gave place to New Orleans, and again has been the State capital since 1882. The situation is on a bluff about 25 feet above the highest water-mark, and affords a fine view of the river and surrounding country. The district is exceedingly fertile, yielding abundant crops of cotton, sugar, Indian corn, sweet potatoes, etc. Several weekly newspapers and one tri-weekly are published here. It has a court-house, State penitentiary, national arsenal and barracks, military hospital, asylums for the deaf and dumb and blind, and a State University. On the 5th of August, 1862, Gen. Breckinridge attacked the Union army here and was repulsed. The Union Gen. Williams defending the city was killed in the action. Population in 1870, 6,498; in 1880, 7,197; in 1890, 10,397. See *Britannica*, Vol. III, p. 442.

**BATON-SINISTER**, an heraldic indication of illegitimacy; a bar laid diagonally over the family arms, or a shield from sinister to dexter. The terms "bar-sinister" or "bastard-bar" are erroneously used for "baton-sinister."

**BATRACHOMYOMACHIA**, *The Battle of the Frogs and Mice*, a Greek mock-heroic poem erroneously ascribed to Homer, with whose work it has been generally printed. Pigres of Caria, who lived in the times of the Persian wars, was named among the ancients as its author. It is a parody on the *Iliad*, in which the military preparations and contests of beasts, with single combats, intervention of the gods, and other Homeric circumstances, are described with much humor.

**BATSHIAN**, one of the Moluccas, lying southwest of Gilolo. It belongs to the Dutch, who in 1610 took it from Spain, or rather from Portugal, then a portion of the Spanish monarchy. Its area is 900 square miles. It is almost intersected by the equator, being only 35' south, with a longitude of 127° 35' east. It produces large sago and cocoa palms, rice and the best cloves in the Moluccas. Chief town Batshian, near the center of the island. Population, 1,110.

**BATTA**, an allowance to the British army in India in addition to the ordinary pay of officers. The pay is fixed, but the batta varies according to the part of the country in which the troops are placed, and also depends upon the circumstances of their being in the field or in cantonments. If in the field, or more than 200 miles from the presidential government, the officers receive full batta; if in garrison within that distance, half batta.

**BATTASZEK**, a market town of Hungary, county Tolna, on the west of the Danube. Population, 6,642.

**BATTEN**, *Lav* or *Latne*, the swing utensil of a loom by which the welt or woof is struck home, and in which the shuttle runs.

**BATTENS**, sawn timber of smaller dimensions than the kind called planks. They are usually from 12 to 14 feet long, seven inches broad, and 2½ inches thick. Cut into two boards (1½ inch thick), they are used for flooring; cut into three boards, they are put on roofs below slates; in narrower pieces they are put upright on walls for fixing the laths for plastering.

**BATTER**, a term used in architecture with reference to a wall which inclines away from the perpendicular as it rises from the ground.

**BATTERSEA**, a southwest suburb of London, situated on the south bank of the Thames. It is partly laid out in market-gardens, and has many manufactories. The flats called Battersea Fields, once famed as a rich botanical station, are now formed into a public park. Adjacent to the park the Thames is crossed by Battersea bridge, Albert bridge, Chelsea bridge and a railroad bridge.

**BATTIANYI**, *Lotus*, *Courst*, a Hungarian patriot, born in 1806 at Presburg. Appointed to the presidency of the ministry in 1848, he favored a liberal policy, and at the end of six months had to resign. When his friends were defeated in battle by the Austrians he was court-martialed and unjustly condemned to death. He was shot Oct. 6, 1849.

**BATTLE-AXE**, a weapon much employed by the early northern nations, Celtic and Scandinavian, and requiring great strength in its use. It could be held with one hand or with both hands. When held with one hand it could be wielded equally by horse and foot; but if held by both hands it could be wielded by foot soldiers only. The battle-axe had a longer handle and a broader, stronger, and sharper blade than the common axe. See *Britannica*, Vol. II, p. 555.

**BATTLE CREEK**, a flourishing city in Calhoun county, Michigan, on the Kalamazoo River, at the mouth of Battle Creek, and on the Michigan Central and the Chicago & Lake Huron Railroad at the point of their crossing. It is 45 miles southwest of Lansing, the State capital, 121 miles west of Detroit, and 163 miles east-northeast of Chicago. Battle Creek affords great water-power, which has helped to build up the manufacturing interests. Here are manufactories of thrashing machines, loes, carriages, and furniture, knitting mills, and several flour mills and iron foundries. The city is well supplied with churches, has one high school and an Advent college. The Potter House (hotel) is a fine building, and the public school building cost \$80,000. Population in 1880, 7,063; in 1890, 13,090.

**BATTLEDOOR**, or **BATTLEDORE** (probably from the Spanish, *batidor*, a beater), the name of an instrument shaped like a small racket, and used in playing battledoor and shuttlecock. This game has been a favorite one in Europe since the fourteenth century.

**BATTLEFORD**, a Canadian town in Saskatchewan on the river of the latter name, at its junction with Battle River. This place was formerly the capital of the Northwest Territory.

**BATTLEMENT**, a notched or indented parapet used in fortification. The rising parts are called cops or merlons, the spaces by which they are separated, crenels, embrasures, and sometimes loops. The object of the device is to enable the soldier to shelter himself behind the merlon while he shoots through the embrasure. The bas-reliefs of Nineveh and the Egyptian paintings testify to its antiquity.

**BATTLE-PIECES**, paintings which represent military conflicts. The *Battle of the Amazons*, by Rubens, and *Battles of Alexander the Great* are fine specimens.

**BATTLE**, *WAGER OF*, in ancient English law, a kind of trial for the decision of controversy, in which the accused threw down his glove and demanded to prove his guilt or innocence by a fight with his accuser, the weapons chosen being staves or wands. If the prosecutor accepted the challenge he picked up the glove and the fight took place before the court of law, continuing till the stars came out at night, or till one of the combatants was killed. The three kinds of cases tried in this manner were: in issues joined upon a writ of right; in appeals of felony; and court-martial or court of chivalry.

trials. Women and infirm people could choose champions and were not themselves obliged to fight. William the Conqueror introduced this "wager of battle," and it was only in 1818 that the barbarous law was repealed.

**BATTUE** (*battre*, the French word, to beat), a method of killing game where a large number of hunters get together and shoot hares, rabbits or pheasants as they are driven out of the woods by men who beat the bushes. In the Highlands deer are sometimes hunted in this way.

**BATURIN**, a town of Russia. It was founded by Stephen Bathory, king of Poland, and was at one time a favorite residence of the hetmans of the Cossacks, of whom Mazeppa, who in 1708 sold himself to the Swedes, is the most notorious. This place, with its once beautiful grounds, is going rapidly to decay.

**BAUDELOQUE, JEAN LOUIS**, an expert French surgeon, born at Picardy in 1746, died in 1810. He was appointed by Napoleon as first accoucheur to attend Marie Louise, and he wrote *Art des Accouchements*.

**BAUDISSION, WOLF HEINRICH FRIEDRICH KARL, COUNT**, a German author and translator, born Jan. 3, 1789, died April 4, 1878. He translated the works of various English authors, and some of Molière's comedies. In company with Tieck he translated a number of Shakespeare's works.

**BAUDRILLART, HENRI JOSEPH LÉON**, a French political economist and publicist, born in Paris in 1821. He was appointed to the chair of political economy in the College of France in 1866, and became general inspector of libraries in 1870.

**BAUDRY, PAUL**, a French painter, born at La Roche-sur-Yon in 1828, died in 1886. He studied at Paris and Rome, was for ten years employed in the decorations of the *foyer* of the Grand Opera in Paris, and was elected member of the Académie des Beaux-Arts. Two of his best works are *Assassination of Marat* and *Punishment of a Vestal Virgin*.

**BAUER, BRUNO**, a German philosopher and biblical critic, born at Eisenberg, Sept. 6, 1809, died April 18, 1882. He was son of a porcelain-painter, and received his education at the University of Berlin, where he was made doctor of theology. From this time (1834) onward he devoted himself to so-called "scientific criticism of the Bible." He was a rationalist of the extreme type. He held the professorship of theology at Bonn, but his views were so pronounced that he was forbidden to lecture, and he therefore removed to Berlin. He eventually believed that the Scriptures had no authority and were mere fabrications. In his last published work, *Critique of the Epistles of St. Paul*, he endeavors to prove the four leading epistles to be apocryphal. Bauer's frequent change of theological opinion alienated the regard of his friends, besides bringing about a complete rupture between himself and the church. He was a voluminous writer, and to the earlier part of his life belong the works: *Criticism of Strauss's Life of Jesus; Journal of Speculative Theology* and *Critical Exposition of the Religion of the Old Testament*. In 1840 he wrote *Critique of the Evangelical History of John*, and three years later *The Question of Liberty and My Own Private Affairs*, and *Christianity Unveiled*. For a time he devoted himself to historical writing, publishing *History of Germany During the French Revolution and the Reign of Napoleon*, and *History of the French Revolution Until the Establishment of the Republic*. It is generally admitted that Bauer is reckless in his biblical criticisms—more agile in detecting error than truth. He is spoken of as the "Voltaire of modern Germany."

**BAUER, CAROLINE**, a German actress born at Heidelberg, in 1807, died at Zurich, Oct. 18, 1878. At

the age of fifteen she made her début on the stage and was a brilliant success in both comedy and tragedy. At twenty-two she married Prince Leopold, afterward king of the Belgians, but their union was short and unhappy. She returned to the stage and in 1844 married a Polish count. She published two volumes of theatrical reminiscences, and six years after her death her *Posthumous Memoirs* were printed.

**BAUER, GEORGE LORENZ**, a German linguist and theologian, born Aug. 11, 1755, died Jan. 12, 1806. He occupied the chair of Oriental languages at Altdorf in 1789, and in Heidelberg in 1805. Two of his works are *Hermeneutica Sacra Veteras Testamenti* and *Biblische Theologie des Neuen Testaments*. His theological views were those of a rationalist.

**BAUER, WILHELM**, a German soldier and inventor, born at Dillingen, Dec. 23, 1822, died June 18, 1875. He made a diving boat, improved torpedoes used for the destruction of ships, and improved the method of firing guns under water. In the Schleswig-Holstein war he served gallantly and afterwards fought in the Russian army.

**BAUERLE, ADOLPH**, a German author of comedies and novels, born April 9, 1786, died Sept. 19, 1869. His works are amusing delineations of life in Vienna. He was the author of *Die moderne Wirthschaft*, *Die falsche Primadonna*, and *Der Tausendasa*.

**BAUERNFELD, EDWARD, VON**, a noted German dramatist, born at Vienna, Jan. 3, 1802. Among his popular comedies are *Die Bekentnisse*, *Bürgerlich und Romantisch* and *Grossjährig*.

**BAUGE**, a town in the department of Maine-et-Loire, France, 23 miles east-northeast of Angers. The English, under the Duke of Clarence, were defeated here in 1402. The town has manufactories of linens and woollens. Population, 3,000.

**BAUHINIA**, a genus of plants of the natural order *Leguminosæ*. The upper petal is somewhat remote from the rest; the leaves are generally divided into two lobes. The species are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants, stretching from tree to tree in the tropical forests, but some are small trees, as the mountain ebony of Jamaica, so called from the color of its wood. The inner bark of the Mallow climber, an East Indian species, is employed in making ropes. The leaves of various species are used for medicinal purposes.

**BAUMGARTEN, MICHAEL**, a German theologian, born March 25, 1812. He was made professor of theology at Rostock in 1850. He suffered fine and imprisonment for publishing works denouncing the State Church of Mecklenburg. He was in favor of disestablishment, and a member of the Protestant-verein. He wrote *Schleiermacher as Theologian*, and an *Apostolic History*.

**BAUMGARTNER, ANDREAS VON, BARON**, an Austrian statesman, born Nov. 23, 1793, died July 29, 1865. He had the chair of physics at Vienna in 1823, and in 1851 was made Austrian minister of trade and public works, also president of the Academy of Sciences at Vienna. He wrote a book called *Naturlehre*.

**BAUMGARTNER, GALLUS JACOB**, a Swiss politician born, Oct. 18, 1797, died July, 1869. He belonged to the liberal party, and was one of the revisers of the constitution of St. Gall. In 1848 he founded "Neue Schweizer Zeitung." One of his published works was *Die Schweiz in ihren Kämpfen und Umgestaltungen von 1830 bis 1850*.

**BAUMSTARK, ANTON, EDWARD and REINHOLD**, a family of eminent German writers. Anton, born at Sinzheim in 1800, occupied, for nearly half a century the chair of classical philology at Freiburg, where he died in 1876. His son Reinhold, born at

Freiburg in 1831, attracted much attention by his *Thoughts of a Protestant on the Pope's Invitation*, a work which was soon followed by his joining the Roman Catholic Church. His numerous writings embrace many valuable biographies, including those of his father and himself. Edward, brother of Anton, born at Sinzheim in 1807, devoted himself to the study of political economy, and for some years taught that science in the University of Greifswald and in the Academy of Political Science and Agriculture at Eldena. He was elected to the national assembly after the revolution of 1848. He advocated the union of German interests, and was a prominent supporter of Bismarck's policy. His writings are nearly all upon economic subjects.

BAVARIA, Kingdom of, a crown state of Germany. Area, 29,632 sq. miles. Population (in 1885), 5,420,199. Capital, Munich, with a population of 261,981.

Royal families of Bavaria, as gazetted Jan. 1, 1891: King Otto William Luitpold, born April 27, 1848; succeeded his late brother, Louis II, March 13, 1886. Regent, Prince Luitpold, born March 12, 1821, uncle of the late and present king; appointed regent June 14, 1886; married April 15, 1844, to Archduchess Augusta of Austria, who died April 26, 1864. Offspring of the union:

I. Prince Ludwig, born Jan. 7, 1845; married Feb. 20, 1868, to Archduchess Maria Theresa of Austria-Este, of the branch of Modena, born July 2, 1849, of which marriage there are issue ten children:—1. Prince Rupprecht, born May 18, 1869. 2. Princess Adelgunda, born Oct. 17, 1870. 3. Princess Marie, born July 6, 1872. 4. Prince Karl, born April 1, 1874. 5. Prince Franz, born Oct. 10, 1875. 6. Princess Matilda, born Aug. 17, 1877. 7. Prince Wolfgang, born July 2, 1879. 8. Princess Hildegard, born March 5, 1881. 9. Princess Wiltrud, born Nov. 10, 1884. 10. Princess Helmitrude, born March 22, 1886.

II. Prince Leopold, born Feb. 9, 1846, Commander-in-Chief of the 1st Bavarian Corps; married April 20, 1873, to Archduchess Gisela of Austria-Hungary, eldest daughter of the Emperor-King Franz Joseph I. Offspring of the union are:—1. Princess Elizabeth, born Jan. 8, 1874. 2. Princess Augusta, born April 28, 1875. 3. Prince George, born April 2, 1880. 4. Prince Konrad, born Nov. 29, 1884.

III. Theresa, born Nov. 12, 1850.

IV. Arnulph, born July 6, 1852, Lieut.-General 1st Division in the infantry of the Bavarian army; married April 12, 1882, to Princess Theresa of Liechtenstein. Offspring, Prince Heinrich, born June 21, 1884.

The late Prince Adalbert, brother of Prince Luitpold, married to Princess Amelia, Infanta of Spain, left the following issue:—1. Prince Ludwig Ferdinand, born Oct. 22, 1859; married April 2, 1883, to Maria della Piaz, Infanta of Spain; offspring, Prince Ferdinand, born May 10, 1881; Prince Adalbert, born June 3, 1886. 2. Prince Alphons, born Jan. 24, 1862. 3. Princess Isabella, born Aug. 31, 1863; married April 11, 1883, to Prince Tommaso of Savoy, Duke of Genoa. 4. Princess Elvira, born Nov. 22, 1868. 5. Princess Clara, born Oct. 11, 1874.

United with the royal family of Bavaria is the branch line of the dukes in Bavaria, formerly Palatine Princes of Zweibrücken-Birkenfeld. The head of this house is Prince Karl Theodor, born Aug. 9, 1833, son of the late Maximilian, Duke in Bavaria, and married (1) Feb. 11, 1855, to Sophia, Princess of Saxony; (2) April 29, 1874, to Maria Josepha, Princess of Braganza.

The civil list, with allowances to the members of the royal family, is at present (Jan. 1891), 5,647,912 marks, equivalent to \$1,111,978.

Under the constitution the crown is hereditary in the male line, and to the king belongs the sole executive authority. The legislative functions are exercised jointly by the king and parliament, consisting of an upper and lower house, for which see *Britannica*, Vol. III, pp. 450–454.

The population of the chief cities Dec. 1, 1885, were as follows:

|                         |         |                      |        |
|-------------------------|---------|----------------------|--------|
| Munich (München)....    | 261,981 | Bamberg .....        | 31,521 |
| Nuremberg (Nürnberg)    | 114,891 | Kaiserslautern ..... | 31,449 |
| Augsburg .....          | 65,965  | Bayreuth .....       | 23,559 |
| Würzburg .....          | 55,010  | Hof .....            | 23,257 |
| Regensburg (Regensburg) | 36,093  | Ludwigshafen on      |        |
| Fürth .....             | 35,455  | Rhine .....          | 41,012 |

The total value of the mining products in 1888 was reported at 7,464,148 marks. The quantity of beer manufactured was 278,000,000 gallons, of which 27,000,000 of gallons were exported. On Jan. 1, 1890, Bavaria had 3,348 railways, of which 2,920 belonged to the state. There are three great universities—at Munich, Würzburg and Erlangen.

The budget of 1890–91 amounted to \$70,072,910. The public debt in 1890 (including railway debt) was \$335,100,695, about three-fourths of which was for railways.

For religion of Bavaria, see RELIGIONS OF THE WORLD in these Revisions and Additions.

BAVARIA, a colossal statue at Munich, bearing the name of the country of which it is a personification. It was erected by King Louis, the model having been executed by Schwanthaler. The figure bears a German aspect. The Bavarian lion, the guardian of her kingdom, reposes at the side of the female in a sitting attitude. The statue is 65 feet high, the pedestal being 30, so that the whole monument has a height of 95 feet. It was cast from the bronze of Turkish and Norwegian cannon. Internally it is very remarkable. Through the back part of the pedestal a door leads to a stone staircase consisting of 60 steps. The figure itself is hollow, and resembles a mine, with a side-passage, which leads into the lion. A staircase of cast-iron of 58 steps leads through the neck up into the head, where there are two sofas and several openings for the enjoyment of the view. The head contains standing room for 31 persons. The figure consists of seven pieces, the lion of five. The monument was uncovered on Aug. 7, 1850.

BAVINS, in the pyrotechny of warfare, are small bundles of easily ignited brush-wood, from two to three feet in length; they are made by arranging the bush ends of the twigs all in one direction, tying the other ends with small cord, dipping the brush ends into a kettle containing an inflammable composition, and drying them. They are employed among the combustible materials in fire-ships.

BAWBEE, or BABEE, the popular designation of a half-penny in Scotland, now dropping out of use. The origin of the term is obscure, but it is most probably a corruption of *bas billion* (French), applicable to debased copper money. In the plural form, the word is often popularly used in Scotland to signify money generally. In Scottish song *bawbee* is synonymous with a girl's fortune or marriage portion, as *Jenny's bawbee*.

BAWR, DE, ALEXANDRINE SOPHIE GOURY DE CHAMPGRAND, BARONESS, a French novelist born at Stuttgart, in 1777, died Jan. 1, 1861. She was the wife of Saint-Simon, the noted Socialist.

BAXTER, ROBERT DUDLEY, a statistical writer, born at Doncaster, England, in 1827, died in 1875. He was a prominent member of the statistical and other scientific societies, and a voluminous writer.

BAXTER, WILLIAM EDWARD, a Scotch *littérateur* and statesman, born at Dundee in 1825, died in 1890. His writings are chiefly descriptive of his travels in Europe, Asia, Africa and America. He was returned to parliament for the Montrose burghs in 1855, 1868, and 1874. He resigned his seat in 1885. He was successively Secretary to the Admiralty and Secretary to the Treasury. He was well known for his opposition to church establishments.

BAXTERIANS, a term applied to those who adhered to Baxter's theological system. The tendency of Baxter's views was toward a more liberal theology, but they are deficient in logical consistency. Nevertheless they have been, and still are, embraced by many pious people, especially among the dissenters, who shrink from accepting what they

consider the hard conclusions of Calvinism or the latitudinarian views of Arminianism.

BAY, a name given to a number of trees and shrubs, resembling the Laurel, *Laurus nobilis*, which is also called sweet bay. The red bay of the southern states of America is *Laurus Caroliniensis*. The white bay is *Magnolia glauca*, and the loblolly bay is *Gordonia Lasianthus*, both of North America. Bay leaves are sometimes used in cookery for the flavor. Since early times they have been associated with popular superstitious usages.

BAYA, a small East Indian bird of the great family of the *Fringillidae*, and of a genus to some of which, from their remarkable manner of constructing their nests, the name weaver bird is often given. It is yellow, spotted with brown, the throat black, the beak conical and large. Its nest is very curious, suspended from a slender twig of a lofty branch, so that monkeys, squirrels and serpents may not reach it, and rendered still more secure by its form, which is very much like a bottle; the entrance, how-

BAYA.

ever, is from beneath, and not from above, with lateral openings to separate chambers, in one of which the female sits upon the eggs, while another is occupied by the male, who there pours forth his song. The nest is composed of fine fibers of leaves and grass. The bird is easily tamed, and can be trained to fetch and carry at command.

BAYAMO, of SAN SALVADOR, a town in the eastern part of Cuba, in a healthful and fertile region on the northern slope of the Sierra Maestra.

BAYANA, or BIANA, a town of India, formerly of considerable importance, having had in time past a fine fort and many temples in the city and near it. These are now in ruins. Bayana is 50 miles southwest of Agra in the Rajput state of Bhurtpur.

BAYARD, JAMES ASHETON, born in Philadelphia, July 28, 1767, died in Wilmington, Del., Aug. 6, 1815. He graduated at Princeton and then practiced law at Wilmington. In 1797 he conducted the famous impeachment case of William Blount of North Carolina. When Burr and Jefferson were rival candidates in the presidential election of 1800, Bayard and Alexander Hamilton were influential in the election of Jefferson. He sat in Congress from 1793 to 1813, with but one year's exception. He went to St. Petersburg and afterward to Holland to assist as one of the peace commissioners in concluding the war of 1812, and was therefore one of the signers of the treaty of Ghent.

BAYARD, JAMES ASHETON, son of the preceding, born at Wilmington, Del., Nov. 15, 1799, died at the same place, June 13, 1880. He was brother of Richard Henry Bayard. The two brothers, the father, Jas. Asheton Bayard, Sr., Thomas F. (son of James Asheton Bayard, Jr.), and Governor Bassett, grandfather of the first two mentioned, occupied seats in the United States Senate. The subject of this sketch studied and practiced law at Wilmington, and was United States attorney for his State during Van Buren's presidency. He entered the Senate in 1851, and was successively re-elected in 1857 and

1862. Mr. Bayard was a Democrat, a believer in State rights, an eminent lawyer, and a man possessed of a high sense of honor.

BAYARD, JEAN FRANÇOIS ALFRED, born at Charolles, March 17, 1796, died Feb. 19, 1853. He wrote a great number of popular comedies, two of which were *Les Gamins de Paris*, and *La Reine de Seize Ans*.

BAYARD, RICHARD HENRY, born at Wilmington, Del., 1796; died at Philadelphia, March, 4, 1868. He graduated at Princeton, studied and practiced law in his native city, and in 1836 was elected to the United States Senate. Before his term expired he was elected chief justice of Delaware. He was again sent to Congress, and from 1850 to 1853 he represented his country at Brussels.

BAYARD, THOMAS FRANCIS, the son of James A., and brother of Richard H. Bayard, born at Wilmington, Del., Oct. 29, 1828. He received most of his education from the Flushing school, and afterwards entered a mercantile house in New York. In 1848 he gave this up and returned to his native city, where he studied and practiced law. He served one year as United States district attorney for Delaware. From 1869 to 1875 and from 1881 to 1885 he represented his State in the United States Senate. During the early part of his service his father also sat in the Senate. President Cleveland selected Mr. Bayard for his Secretary of State in 1885. Mr. Bayard was a member in 1876-77 of the famous electoral commission; he was a candidate for the Democratic nomination for the presidency in 1880 and 1884.

BAYBERRY, the fruit of *Laurus nobilis*, the common bay tree; also the wax-myrtle, *Myrica cerifera*, and its fruit. The latter produces a coating of wax known as bayberry-tallow, or myrtle-wax, sometimes employed for making candles, and much used in pharmacy. This tree has active medicinal properties. It is found along the Atlantic coast of the United States.

BAY CITY, is the capital of Bay county in Michigan, situated on the east bank of the Saginaw River, five miles from Saginaw Bay, 78 miles northeast of Lansing, the capital of the State, and 108 miles north-northwest of Detroit. It is on the Jackson, Lansing & Saginaw Railroad, and is the terminus of the Detroit & Bay City and the East Saginaw Railroad. The city is handsomely laid out, having wide and straight streets, crossing at right angles. Several of the avenues are 80 to 100 feet wide. This city has extensive mills for sawing timber, and has a great lumber trade. Here also are manufactured and exported great quantities of salt. The city is well and substantially built, the business portion chiefly of brick. It is connected with West Bay City (formerly Wenona) and Salsburg on the other side of the river by three bridges. One of these was built by the Michigan Central Railroad Company for its own use. The Holly system of water works is used to supply the city with pure water from the Saginaw Bay. There are about 20 churches, good schools, a high school and public library. Here are two national banks and two other banks. Bay City was incorporated in 1865. Population in 1860, 1,583; in 1870, 7,064; in 1880, 20,693; in 1890, 27,826.

BAYER, JOHANN, born at Augsburg, Germany, about the year 1572, died in 1660. He was an earnest Protestant pastor, but he is now remembered for the new system which he introduced for the naming of the stars. He published *Uranometria*, which contained 51 astronomical charts. These were not altogether accurate, but he employed the method of naming the stars in a constellation after the letters of the Greek alphabet, those of greatest brilliance being named in order from the first letters. This

method has been followed from his time to the present.

**BAYEUX TAPESTRY** (see *Britannica*, Vol. III, p. 458; Vol. VIII, p. 162), a piece of pictorial needlework, 214 feet long, 20 inches wide, containing the figures of 625 men, 200 horses, 40 ships, besides dogs, birds, etc. It was discovered in the cathedral of Bayeux in 1730, it is now preserved under glass in the public library in the Hotel de Ville of the same town.

**BAY ISLANDS**, a small group in the Bay of Honduras, about 150 miles to the southeast of Belize, embracing only 25' of latitude and 1° 15' of longitude. The chief island is Ruatan, and the others of any consequence are Bonacca, Utila, Barburet, Helena and Morat.

**BAYLEN**, a town in the province of Andalusia, Spain, situated 22 miles north-northeast of Jean. It is celebrated as the place where the Spaniards won their first and only victory over the French in July, 1808. It has manufactories of linen, glass, bricks, tiles, soap, etc. Population, 4,976.

**BAYLES**, JAMES C., born in New York city, July 3, 1845. He served for a time in the civil war, but ill-health obliged him to resign his lieutenant's commission. He turned his attention to journalism, and was editor of the New York "Citizen," and afterwards of the New York "Commercial Bulletin," the "Iron Age," and the "Metal Worker." He has made a study of metallurgy, sanitary topics and the labor question; on these subjects he has written and lectured.

**BAYLEY**, JAMES ROOSEVELT, born in New York city, Aug. 23, 1814, died at Newark, N. J., Oct. 3, 1877. He graduated at Trinity College, Hartford, in 1835. After a year's study of medicine he turned his attention to theology, and was in 1840 established as rector in Harlem. Becoming dissatisfied with certain Episcopal doctrines, he resigned his charge and went to Europe. He became a Roman Catholic and studied for the priesthood in Paris. He was made vice-president and then president of St. John's College, Fordham; was pastor of a church on Staten Island; private secretary to Bishop Hughes, and in 1853 was created first bishop of Newark. He was an industrious laborer for the cause of his church, collecting valuable information in respect to its early history; traveling extensively and visiting Europe and the Holy Land; encouraging Roman Catholic education and helping to found colleges and religious orders. In 1872 he was made archbishop of Baltimore—the highest honor ever given by the Pope to an American priest. Archbishop Bayley was a philanthropic man, an untiring worker and the author of historical works relating to the Roman Catholic church.

**BAYLY**, LEWIS, bishop of Bangor, Wales, born at Caermarthen, died in 1632. His famous book, *The Penitence of Piety*, passed through fifty-one editions, besides being translated into several foreign languages. His son, Thomas, became a Catholic, and wrote *The End of Conversion*.

**BAYLY**, THOMAS HAYNES, an English song-writer and author, born at Bath, Oct. 13, 1797, died April 22, 1839. He studied law and theology, but discovering his talents as a ballad writer, he gave up these pursuits and went to London, where he composed *The Soldier's Tear*, *I'd Be a Batt'ler*, *Oh No, We Never Mention Her*, and others. Besides popular songs he wrote tales, a novel, volumes of verse, and several dramatic pieces.

**BAYNE**, PETER, a writer and editor, born at Fodderty, Ross-shire, Oct. 19, 1830. He studied in Aberdeen and later edited newspapers in Glasgow, Edinburgh and London. He wrote *Christian Life of the Present Time*, *Lessons from My Masters*, *Two Great Englishwomen*, and *Life of Luther*.

**BAYNES**, THOMAS SPENCER, a versatile author, born at Wellington, Somerset, March, 24, 1823, died May 30, 1887. He pursued his studies at Bristol College and Edinburgh University. He assisted Sir William Hamilton in a translation of *Port Royal Logic* and an *Essay on the New Analytic of Logical Forms*. From 1857 to 1864 he was assistant editor of the "Daily News," at the end of which time he took the chair of logic, rhetoric and metaphysics in St. Andrews University. He was a magazine contributor, and editor of the ninth edition of the *Encyclopædia Britannica*.

**BAY OF ISLANDS**, a large bay on the western coast of Newfoundland, north of St. George's Bay, inclosing a number of islands. The name is also given to a settlement on the bay, on what is called the French shore. Herring fishing is the chief industry, about 30,000 barrels being annually taken. Limestone, marble, and quantities of gypsum are found here. A large, deep and safe harbor near the northern extremity of New Zealand is also called Bay of Islands. On its southern side is the port and town of Russell, with a United States consul.

**BAYONNE** (bā-yon) is a rapidly growing city in Hudson county, N. J. The population has doubled in the last decade. It is about 6 miles southwest of New York city, situated on the New York and Newark bays. The former villages of Bergen-Point, Centerville, Payonne and Saltesville now compose this city, through which runs the Central Railroad of New Jersey. Bayonne is separated from Jersey City by Morris Canal, and from Staten Island by the Kill-von-Kull. On the Kill-von-Kull the Port Johnson coal docks are situated, near Bergen Point. At these docks several hundred men are employed in receiving and shipping coal. About 30 to 40 trains run daily to and from New York. Here are a dozen churches, five public schools, also color-works, paint-works, chemical-works and petroleum refineries. Population in 1880, 9,372; in 1890, 18,996.

**BAY RUM**, a fragrant liquid obtained by distilling the leaves of the bay-berry (*Myrsin acris*), a tree which grows in the West Indies and belongs to the order *Myrtaceæ*.

**BAY SALT**, a name applied to common salt procured from sea-water by solar evaporation. It is principally obtained from salt-marshes, which exist along the coast of France and on the shores of the Mediterranean.

**BAY VIEW**, a thriving town of Wisconsin, situated on Lake Michigan, two miles south of Milwaukee. It contains extensive iron-works, and in the vicinity are establishments for the manufacture of glass. A Roman Catholic college and convent are located in the adjacent village of St. Francis.

**BAY-WINDOW**, a window which projects outward, forming a bay or recess in a room. It is sometimes incorrectly called a "bow-window." A bay-window may have three or more sides, but is always straight-sided.

BAY-WINDOW.

**BAZAAR**, or **BAZAR**, a Persian word originally meaning an Oriental market-place, where all sorts of goods and also slaves are exposed for sale. Ispahan, Tabriz, Constantinople and Cairo have famous bazars. In the United States the word has come to signify a store or a booth where miscellaneous or fancy articles are sold, usually for charitable purposes.

**BAZAINE**, FRANÇOIS ACHILLE, a marshal of France, born at Versailles in 1811, died in 1888. He

became a soldier in 1831, and served in Spain, Algiers, the Crimea and Italy. He was with the expedition to Mexico in 1862, and was put in command of the army in 1863. He was made commander-in-chief of the Imperial Guard in 1869. He commanded a corps near Metz at the outbreak of the Franco-Prussian war, and on the eve of the retreat of August, 1870, he took command of the main armies of France. After the defeat at Gravelotte he retired again to Metz, where he capitulated, surrendering his entire force of 173,000 men. For this he was court-martialed in 1873, and sentenced to death, which was commuted to imprisonment for twenty years. In 1874 he escaped from the Isle Ste. Marguerite, and succeeded in reaching Madrid. In 1883 he published a book in justification of himself.

**BAZALGETTE**, SIR JOSEPH WILLIAM, an English civil engineer of French descent, born in 1819. He won fame by constructing sewers, altering streets, and making river embankments. He was engineer-in-chief of the metropolitan board of works in London. He introduced a method of working underground in the laying of water and gas pipes, thus avoiding the tearing up of pavements.

**BAZANCOURT**, CÉSAR DE, baron, a French writer, born in 1810, died Jan. 25, 1865. Louis Philippe made him director of the library of Compiègne, and under Napoleon III he held the office of historiographer. He wrote histories of the Crimean, Italian, Chinese and Cochinchinese wars of Napoleon III, besides a *History of Sicily Under the Norman Rule*.

**BAZARDJIK**, a Bulgarian town which holds an important fair in April. Tatar Bazardjik, a town of Eastern Roumelia, 23 miles west of Philippopolis. It has warm baths.

**BAZEILLES**, a village of France on the right bank of the Meuse River, 4 miles southeast of Sedan. September 1, 1870, the day of the battle of Sedan, it was burned by the Bavarians, but it has since been rebuilt.

**BAZIN**, ANAIS DE RANCOURT, French lawyer and historian, born at Paris in 1797, died in 1850. He wrote *History of France Under Louis XIII*.

**BAZIN**, ANTOINE PIERRE ERNEST, a French physician, the descendant of a long line of medical practitioners, was born at St. Brice, Feb. 20, 1807. He has written much on skin diseases, and in 1847 became physician and professor of dermatology in the St. Louis hospital of Paris.

**BAZIN**, ANTOINE PIERRE LOUIS, brother of the preceding, born March 26, 1799, died in January, 1863. He was a translator of many Chinese works, a professor of the Chinese language, and author of a grammar of the Mandarin dialect.

**BAZLEY**, SIR THOMAS, Bart., an English manufacturer and politician, born at Gilnow, Lancashire, England, in 1797. In 1826 he employed over 1,000 persons at Manchester in the making of fine cotton and lace thread. He established free schools and lectures for his emloyéys. He entered Parliament in 1858, where he was known as a free-trader and anti-corn-law man.

**BAZOCHE**, or BASOCHE. When the French parliament began to administer justice, and ceased to be the grand council of the king (about the fourteenth century), those noblemen who formed the royal train were called *courtiers*, and those who attended on the sittings of the French parliament took the name of *basochians*, or parliament clerks. The latter, in the spirit of fun, chose a king, chancellor, and other officers from their own number; but Henry III would not allow of a mock king, and suppressed that office, but exalted that of chancellor. This mock court held meetings for the admin-

istration of justice, circulated a kind of currency, and had many ridiculous rites and ceremonies. They began the performance of farces, which even the king sometimes attended. These farces were the beginning of French comedy.

**BEACH**, MOSES YALE, an eminent American inventor and publisher, born at Wallingford, Conn., in 1800, died in 1868. He was long connected financially with the New York "Sun," and is regarded as the originator of the American one-cent newspaper. He invented the rag-cutting machine now generally used in the making of paper, and was much interested in experiments on machines for propelling balloons.

**BEACH PLUM** (*Prunus maritima*), a straggling bush found growing along the Atlantic coast of the United States. It bears a red or purple fruit, which is somewhat like the cultivated plum, and which is eaten either fresh or preserved.

**BEACON**, any signal set upon a height, but especially the alarm-fires at one time used to spread the intelligence of foreign invasion or other great events. Fire signals were in use in the earliest times, and notices of them are found in the literature of ancient Persia, Palestine and Greece. They were made by kindling a pile of wood on the tops of lofty mountains, and keeping the flame bright by night, or having the fire so covered as to emit a dense smoke by day.

**BEACON**, in maritime affairs a signal of warning against dangers, or for indicating the proper entrance into a channel, harbor or river. In recent times the construction of floating beacons has occupied a good deal of attention, as it is thought that in many cases they might supply the place of costly light-houses.

**BEACONSFIED**, BENJAMIN DISRAELI, EARL OF. See DISRAELI, BENJAMIN, in these Revisions and Additions.

**BEAD**, in architecture, a small round molding, sometimes termed an astragal. It occurs mainly among the classical styles, and is used in picture frames and other articles carved in wood.

**BEADLE**, an inferior parish officer in England, chosen and appointed by the vestry. His duty is to attend the vestry, to give notice of its meetings to the parishioners, to execute its orders, to assist the parish constable, and generally to do the business of the vestry and of the parish as their messenger or servant.

**BEADS**, ST. CUTHBERT'S, a title popularly given to the single joints of the articulated stems of encrinurites. The central perforation permitted them to be strung as beads, and from the fancied resemblance, in some species, of this perforation to a cross, they were formerly used as rosaries and associated with the name of St. Cuthbert. They are also known as entrochites and wheelstones.

**BEAGLE**, a small variety of hound, sometimes used for hare-hunting. It has now been almost wholly superseded by the harrier, to which its name is sometimes given. The true beagle is smaller than the harrier, not above 10 or 11 inches in height at the shoulder, of stout and compact make, with long, pendulous ears. It is remarkable for its exquisite scent and perseverance. The beagle gives utterance to a cry which has been regarded as particularly musical. The smallest are sometimes called LAP-DOG BEAGLES.

**BEAKER**, formerly the name of a drinking cup or bowl, but now applied to a vessel made of very thin glass, having a flat bottom, perpendicular sides, and a lip for pouring, and used in laboratories for making chemical solutions.

**BEALE**, LIONEL SMITH, an English physician and physiologist, born at London in 1828. His medical

writings, including works on microscopy, kidney diseases, urinary deposits, the distribution of nerves to voluntary muscle, and the structure and growth of the tissues, are important; and his *Protoplasm*, *Life Theories*, *Life and Vital Action*, and *Principles and Practice of Medicine in Slight Ailments*, are standard works.

**BEAM**, of a ship, one of the main timbers which assist to support the decks. They reach across from side to side, not only strengthening the decks, but also helping to uphold the sides of the hull, being themselves supported at the ends by massive pieces, called knees, standards and clamps.

**BEAM TREE**, WHITE, a tree from 20 to 40 feet in height; it has a straight erect trunk, and a round or oval head. The leaves are ovate cut and serrated, white and downy beneath; the flowers in large terminal corymbs; the fruit scarlet, and the size of a small pea; is acid and astringent, but becomes agreeable by incipient decay. It is sometimes called service-berry, and resembles it in quality, although much smaller. Beer is made of it by fermentation. The wood, very hard and fine-grained, is used for cog-wheels. The whiteness of the foliage makes the tree ornamental in plantations. It is a native of Europe and Asia.

**BEAN-CAPER** (*Zygophyllum fabago*), a small tree found in the Levant, where its flower-buds are used as a substitute for capers.

**BEAN-FEAST**, the name of an annual dinner given by employers to their employes; probably so called because of the prominence of beans or of a bean-geese at the repast. The name bean-feast was often given also to the bean-king's festival.

**BEAN KING'S FESTIVAL**, a social rite principally observed in France, from which country it seems to have been transplanted to Germany. On the evening of the Twelfth Day, or, as the Germans call it (in allusion to the legend that the wise men of the East who came to worship Christ were three kings), Three Kings' Day (Dreikönigstag), companies assemble to spend a few hours in mirthful relaxation. A large cake is baked with a bean hidden somewhere in it. The cake is then divided, each person present receiving a piece, and whoever obtains the one with the bean is king for the year. In this capacity he holds a mock-court, and receives the homage of the company, who also amuse themselves with other diversions. The bean king, however, is compelled to pay for his dignity; for he has to give an entertainment on the next Twelfth Night, that an opportunity may be afforded to choose another king.

**BEAR-BAITING**, a barbarous sport existing formerly in several countries, in which bears were baited by dogs. It was one of the established English amusements among the lower classes and the aristocracy alike; Queen Elizabeth, according to narration, herself witnessed these rude exhibitions. *Bear-garden* was the term applied to any place where bears were kept and publicly baited. Until lately, a certain spot situated near Westminster was known by this name.

**BEARBERRY**, a name somewhat loosely applied to several shrubs. The red bearberry (*Arctostaphylos uva-ursi*), also called bear's grape, bear's bilberry, and foxberry, is the "kinnikinnie" of the American Indian, and is much used in medicine as an astringent tonic, under the name of *uva-ursi*. The black bearberry (*Arctostaphylos alpina*) is a dwarf arctic-alpine trailing shrub, with black berries which are sometimes eaten. A species of *Rhamnus* known as bearberry, bearwood, and by the specific designation *purshianus*, from the fondness of bears for its berries, yields the *Sascara sagrada* bark, used as a tonic aperient.

**BEARD**, GEORGE MILLER, a physician, born at Montville, Conn., May 8, 1839, died in New York, Jan. 23, 1883. He studied at Phillips' Andover Academy and Yale College. In 1865, after over a year of experience as assistant surgeon on the gunboat *New London*, he settled in New York and devoted his attention to nervous diseases. Among his works are: *General Electrization*, *Stimulants and Narcotics*, *Eating and Drinking*, *Clinical Researches in Electro-Surgery*, *Legal Responsibility in Old Age*, *Hay Fever*, *Physiology of Mind Reading*, *Problems of Insanity*, and *Inebriety and Allied Nervous Diseases of America*.

**BEARD**, WILLIAM HOLBROOK, an artist, born at Painesville, Ohio, April 13, 1825. He devoted himself at first to portrait painting. He visited Europe, where he pursued his art studies for one summer. Returning, he settled in New York city and painted pictures of animals which he depicts in allegorical style. Some of his paintings are *Kittens and Guinea Pig*, *Bears on a Bender*, *Ruining Cats and Dogs*, *Voices of the Night*, and *Who's Afraid?* A collection of his sketches entitled, *Humor in Animals*, was published in 1885. He had four sons, all of whom are clever artists. The best known is Frank, the third son, who was in the employ of Harper & Brothers during the war. He lectures, and at the same time illustrates his subject with free-hand sketches. He has published a book entitled, *The Blackboard and the Sunday School*.

**BEARDSTOWN**, one of the oldest towns of Illinois, situated on the Illinois River, about fifty miles west of Springfield. It has manufactories of machinery, iron, flour, woolens, and lumber, and the springs which yield the noted "Lithia Water."

**BEARER COMPANY**, an organization for the removal of wounded soldiers from a battle-field. The service, which was first introduced into the army of Great Britain in 1873, is well equipped, and forms a most efficient link between the battalion stretcher bearers and the field hospitals.

**BEAR-LEADER**. In former times bears were led about the streets muzzled and made to dance or stand on their hind legs for popular entertainment, small dancing dogs being usually added for the sake of attractiveness. Hence the phrase came to be used of a discreet person who took charge of a young man of wealth on his travels.

**BEAR-PIT**, a pit prepared for keeping bears, usually seen in zoological gardens. It is circular, measuring about 25 feet in diameter, and 20 feet deep. The sides, generally built with brick, the bottom level and paved with stone, and around are vaults for the residence of the bears; from the center of the pit rises a stout, tall pole, on which are cross-bars at proper distances, to enable the bears to climb to the top. The poles are sufficiently distant from the sides to prevent the bears from leaping out. The vaulted receptacles require to be cool and dry.

**BEAR RIVER**, a river of the United States, which rises in the Rocky Mountains and empties into Great Salt Lake. Its total length is about 400 miles.

**BEAR RIVER**, a port of entry in Digby county and township, Nova Scotia, at the head of navigation; it carries on shipping and a considerable manufacture in lumber and leather.

**BEARS AND BULLS**. See *Britannica*, *Bulls* and *Bears*.

**BEAR'S GREASE**. Under this name there were sold preparations for the toilet, represented to be of great efficiency in nourishing and promoting the growth of hair; these so-called preparations of bear's grease being for the most part composed of purified beef-marrow, hog's lard, or fat of veal and

spermaceti, along with almond oil, and some scenting ingredients.

**BEARING** of a ship at sea is the direction in which she sails, in reference to the points of the compass. On shipboard, seamen often conveniently refer to the bearing of another ship, or of an object on shore, not to the points of the compass, but relatively to the line followed at the moment by the ship's keel. Thus the bearing of a distant object may be *ahead*, *astern*, on the *starboard bow*, on the *larboard quarter*, etc., the bow being between the head and the midship, and the quarter between the midship and the stern.

**BEARING THE BELL**, a phrase which signifies to take the lead or first place in anything, or to carry away the prize. This old colloquial phrase is said to have originated in a practice, at the early part of the seventeenth century, of giving a small golden or silver bell as a prize to the winner at horse-races.

**BEAS**, a river of India, one of the "Five Rivers" of the Punjab, rises in the Snowy Mountains, 13,320 feet above sea-level, and flows through the Kangra Valley to the plains of the Punjab, where it empties into the Sutlej. Its length is nearly 300 miles.

**BEAT**, in music, a signal given by the hand to insure simultaneous performances, the hand being raised on the unaccented, and lowered on the accented, part of the bar.

**BEAT OF DRUM** in military matters, is a signal or instruction conveyed by a particular mode of drum-beating. It is an audible semaphore, a telegraph which speaks to the ear instead of the eye. There are many varieties, known by the names of the general, the assembly, the foot march, the call to arms, the drummer's call, the sergeant's call, etc. Some of the same instructions or commands are also given by the bugle, and some by the trumpet.

**BEATIFICATION** is a solemn act in the Roman Catholic Church, by which the Pope, after scrutinizing the life and services of a deceased person, pronounces him blessed; after this he may be worshipped in a specified portion of the church, and the act holds out the prospect of future canonization, which entitles him to general worship in the church universal. It was introduced in the 12th century, and may be regarded as an inferior degree of canonization. See *Britannica*, Vol. V, p. 23.

**BEATIFIC VISION**, the direct vision of God, constituting the essential bliss of angels and of glorified saints, is, in respect of the latter, put by the Greek Church, and by most Protestants, after the day of judgment. The Council of Florence and the Council of Trent, however, declared that "the souls of those who have remained pure and spotless after baptism, and of those whose sins after baptism have been pardoned, either in this life or in the next, are immediately received into heaven."

**BEATING AND WOUNDING**, or simply wounding, is the name sometimes occurring in law books for the offense of seriously wounding or hurting another; it has also been described as an aggravated species of battery.

**BEATING THE BOUNDS**, the popular English expression for those periodical surveys or perambulations by which are preserved the early parish boundaries, the procedure, according to the general custom, being as follows: On Holy Thursday or Ascension Day the clergyman of the parish, in company with the parochial officers and other parishioners, followed by the master of the parish school together with the boys, visits the different parish boundaries, the boys striking each of these with peeled willow wands, from which action has come the expression beating the bounds. Sometimes the boys

themselves were beaten, to make the locality memorable. See *Britannica*, Vol. XVIII, p. 295.

**BEATON, JAMES**, uncle of Cardinal Beaton, was Archbishop of Glasgow, and afterwards of St. Andrews. He was a zealous opponent of the Reformation. He died at St. Andrews in 1539. See *Britannica*, Vol. III, pp. 465-66.

**BEATON, JAMES**, nephew of Cardinal Beaton, born in 1517, died in 1603. In 1552 he became Archbishop of Glasgow. On the death of Mary of Lorraine he withdrew to Paris. See *Britannica*, Vol. III, pp. 465-66.

**BEATRICE**, a city of Nebraska, and capital of Gage county, on the banks of the Blue River. It is nearly in the center of the county, which is very fertile, producing almost all kinds of grain and grapes grown in this country. It was settled in 1857, and incorporated as a city in 1883. During the last decade it has made rapid strides in population and business. Four great railroads center here: viz. Burlington & Missouri, Union Pacific, Rock Island, and Kansas City & Beatrice. It is the second city in the State in its railroad accommodations, Omaha, one hundred miles distant, standing first. The city is regularly laid out; streets are broad, crossing at right angles and well lighted with gas and electricity. There are six miles of paved streets, six miles of street car tracks, and abundance of good water from artesian wells. The Holly system of water works is employed, using twelve miles of mains. Telegraph and telephones afford all needed means of communication.

The public buildings are substantial, and built with much architectural taste. The new court-house is a fine stone structure of four stories, with a tower 120 feet high. The main front is 140 feet, and the east and west fronts each 82 feet. The style is Romanesque. The city-hall is a solid and commodious two story building. Other fine buildings are the Nebraska National Bank, Beatrice National Bank, Masonic Temple, Nebraska Institution for Feeble-minded Youth, and High School. There are six banks, including two national banks, and five public schools. The High School prepares pupils for admission to the State University. There is also an excellent Business College and a large free circulating library. The postoffice is self-supporting, and in addition pays \$7,000 annually to the government. The fire department is ample and efficient. Beatrice is noted for quarries of magnesian limestone, used as a building material. The river furnishes a fine water-power. The principal manufactures are cement, flour and lumber. Beatrice is the headquarters for the work of the United States land-office for the Nemaha district. Population in 1880, 2,447; in 1890, 13,921.

**BEAUCE**, a district of France, celebrated for the beauty and fertility of its grain-fields. The capital is Chartres.

**BEAUCLERC, TOPHAM**, an intimate friend of Samuel Johnson, and grandson of the first Duke of St. Albans, born in 1739, died in 1780. In 1768 he married Diana, daughter of the Duke of Marlborough, and divorced wife of Lord Bolingbroke.

**BEAUFORT, HENRY, CARDINAL**, natural son of John of Gaunt, and half-brother of Henry IV, born in 1377, died in 1447. He was made a cardinal in 1426. He was known as the wealthiest man in England. He was devotedly attached to King Henry V, to whom he lent sums of money almost fabulous for those days.

**BEAUFORT**, a town of North Carolina, capital of Carteret county, and a port of entry, is situated at the mouth of Newport River. Its harbor, defended by Fort Macon, is the best in the State. The

Cape Lookout Light-house, 156 feet high, is eleven miles southeast.

**BEAUFORT**, a town of South Carolina, capital of Beaufort county, and a port of entry, is situated on Port Royal or Beaufort Island, and on an arm of the sea called Port Royal River. There is an excellent harbor for vessels drawing 15 to 16 feet of water. The chief exports are lumber, rice, cotton, and phosphate of lime.

**BEAUFORT**, an inland district of the west division of Cape Colony, South Africa, chiefly used for pasturage; its oxen being, in seasons of abundant rain, decidedly the fattest in the colony. Its area is about 13,050 square miles. West Beaufort, its capital, is on the Gamka, 368 miles east of Cape Town.

**BEAUGENCY**, an ancient town of France, in the department of Loiret, situated on the right bank of the Loire, 15 miles southwest of Orleans. It was at one time surrounded by walls, flanked with towers and bastions, and defended by a strong castle, now ruined. In the histories of the wars of France it occupies a conspicuous place. It was successively in the hands of the Huns, Saxons, Normans and English, but it sustained most damage during the religious wars of the 16th century. It has manufactories of woollens, leather, etc., and has a trade in wine, wool, and corn. Population, 3,882.

**BEAUHARNAIS**, ALEXANDRE, VICOMTE DE, grandfather of Napoleon III, was born at Martinière in 1760. He served under Rochambeau in the American Revolution, and in 1789 he participated in the French Revolution. He was secretary of the National Assembly, and a member of the military committee. He declined the office of minister of war in 1793, and resigned the command of the Army of the Rhine. In 1794 the revolutionary tribunal sentenced him to death upon a charge of having acceded to the surrender of Mainz, and he died on the scaffold, July 23 of that year.

**BEAUJOLAIS**, a district of France, a subdivision of the old province of Lyonnaise, is noted for its fine vineyards, which yield the excellent Beaujolais wine.

**BEAULIEU**, a village of Hampshire, England, the site of an ancient Cistercian abbey founded by King John; the village is situated on the verge of the New Forest, near Lymington.

**BEAUMONT**, a town of Texas, county-seat of Jefferson county, situated on the Neches River, at the head of tide-water navigation, about 80 miles east of Houston. It is in the heart of the lumber belt of eastern Texas, and has a large trade in yellow pine and cypress lumber and shingles, which are here manufactured and shipped by water *via* Sabine Pass.

**BEAUMONT**, JEAN BAPTISTE ELIE DE, chief engineer and professor of geology in the School of Mines at Paris and in the *Collège de France*, born at Canon in 1798, died in 1874. He was a practical geological investigator, as well as a clear and acute speculator.

**BEAUMONT DE LA BONNIÈRE**, GUSTAVE DE, a French advocate and publicist, grandson of La Fayette, born in Sarthe in 1802, died in 1866. He became a member of the Chamber of Deputies in 1840, and of the National Assembly in 1848. In 1851 he was imprisoned for his opposition to the *coup d'état* of December. The works by which he is best known in America are *Slavery in the United States* and *The Penitentiary System of the United States*, founded upon personal observation during a visit to this country.

**BEAUMONT**, JOHN C., a rear-admiral of the United States navy, born in Pennsylvania in 1821, died in 1882. He was distinguished for his efficient

service during the shelling of Drury's Bluff and in the two attacks on Fort Fisher. He became a captain in 1872 and rear-admiral in 1881.

**BEAUMONT**, WILLIAM, born at Lebanon, Conn., 1796, died at St. Louis, Missouri, April 25, 1853. While United States surgeon at Mackinac in Michigan, he was called to attend Alexis St. Martin, who had been shot in the side. The wound healed, but an opening in the stomach remained, through which Dr. Beaumont was able to watch the process of digestion. The results of his investigations were published, and proved a valuable addition to physiological knowledge.

**BEAUNE**, FLORIMOND, an eminent French mathematician, born at Blois in 1601, died in his native town in 1652. He was a friend of Descartes, whose work he much improved. He is regarded by many as the proper founder of the integral calculus.

**BEAUPORT**, a manufacturing town of Canada, about four miles northeast of Quebec. It contains the famous Beauport Lunatic Asylum and important manufactories of lumber, nails and flour.

**BEAUREGARD**, PIERRE GUSTAVE TOUTANT, born near New Orleans, La., May 28, 1818. He graduated at West Point in 1838, standing second in a class in which were men who afterwards became famous generals. In 1847 he was made captain of engineers, having served at various stations, and during the war with Mexico in engineering work. When the Southern States seceded he offered his services, and those were his troops which opened fire on Fort Sumter. From this time onward he was virtually the commander of the Confederate troops. He was in command at Charleston for a year and a half; he reinforced Lee in 1864; defeated Butler, and held Petersburg. He attempted to check Sherman's march to the sea but was unsuccessful, and with General J. E. Johnston surrendered to Sherman in April, 1865. Since the war General Beauregard has been president of a railroad, adjutant-general of the State and manager of the Louisiana State lottery.

**BEAVER**, a remarkable rodent (*Castor fiber*), once common to all northern regions, but now confined chiefly to North America. It is characterized by a blunt nose, very short ears, webbed hind feet, and a tail flat, ovate, and covered on its upper surface with scales. The beaver is an object of much interest on account of the ingenious houses, with subaqueous entrances, which it builds on the banks of rivers and lakes, and for its remarkable skill in the construction of dams across streams. It is prized for its fur, and for a secretion called castor, or castoreum, much used in perfumery and formerly in medicine. See *Britannica*, Vol. III, pp. 475-6; Vol. XV, p. 418, and Vol. IX, p. 838.

**BEAVER**, JAMES ADAMS, a descendant of a famous Huguenot family, born at Millerstown, Perry county, Pa., Oct. 21, 1837. He graduated at Jefferson College, and afterwards practiced law at Bellefonte. In 1861 he responded to the call of President Lincoln for volunteers, and was soon made lieutenant-colonel of a regiment. He was wounded at Chancellorsville, was present at Gettysburg, but not allowed to take command on account of physical weakness. He was in the Wilderness campaign, and was again wounded at Cold Harbor. At Petersburg he was injured, but returned to the battle-field of Ream's Station in an ambulance, and just as he had resumed command his right leg was shattered by a rifle-ball. It was amputated, and he was incapacitated for further military service. He was elected a trustee of the Pennsylvania State College; has been a popular campaign speaker, and was Republican governor of Pennsylvania from 1887 to 1891.

**BEAVER**, a town of Pennsylvania, county-seat of Beaver county, situated on the Ohio River, about twenty-five miles from Pittsburgh. It is the seat of Beaver Collegiate and Musical Institute, an academy, a seminary, and other excellent schools.

**BEAVER**, a city of Utah, county seat of Beaver county, situated on Beaver River, about 200 miles south of Salt Lake City. Lead and copper are found in the neighborhood, and there are manufactories of leather and woollens. Beaver is the seat of a fine academy.

**BEAVER DAM**, a city of Wisconsin, situated on Beaver Dam Creek, about 60 miles northwest of Milwaukee. It has an excellent water-power, and manufactories of woollens, flour, carriages and agricultural implements. It is the seat of Wayland University.

**BEAVER FALLS**, a manufacturing town of Pennsylvania, located on Beaver River, about 30 miles northwest of Pittsburgh. An excellent water-power and an abundant supply of natural gas are utilized in the manufactories of the town, which include those of iron, machinery, flour, cars, cutlery, wire fence, stoves and farming utensils. Beaver Falls is the seat of Geneva College.

**BEBEERINE**, an alkaloid obtained from the Greenheart bark, or *Bebeeru* of Demerara, and used in medicine in place of quinine, which it resembles in properties, though it is not so powerful in its action as a tonic and febrifuge. The condition in which it is generally sent into market is as the sulphate of bebeerine, occurring in shining scales of a pretty brown color, and soluble in water.

**BEBEERU**, or **BIBIRU**, the native name of the Greenheart of commerce, a tree of British Guiana, of the natural order *Lauraceæ*. The wood is very hard and durable, and is largely used in ship-building and for submarine structures, being remarkably free from the ravages of the ship-worm. The active principle of the bark is the bebeerine or bibirine of medicine, used in the form of a crude sulphate as a bitter tonic and febrifuge. See *Britannica*, Vol. III, p. 633.

**BECANCOUR**, a town of Canada, about 90 miles southwest of Quebec. It is the headquarters of an extensive trade in lumber and flour.

**BECCAFICO**, a little bird of the family *Sylviadæ*, or Warblers, a native of the southern parts of Europe, and in great demand for the table in Italy, its flesh being regarded as of peculiar delicacy. It is a mere summer bird of passage, and has a very pleasant song. Beccafico is an Italian name, and is sometimes extended to other birds of the same family used for the table.

**BECCAMOSCHINO**, a little bird of the family of Warblers, found in Italy, and remarkable for its nest, which resembles that of the tailor birds, usually placed in a bush of lengthened herbage, the leaves and stalks drawn over it, and a flooring formed for it by leaves curved across below, and sewed together generally with some kind of vegetable fibers.

**BECUUANALAND**, a British-African crown colony adjacent to the South African Republic on the east. Total area, 162,000 square miles, of which 45,000 form the crown colony proper. Population (of British colony in 1885), 44,135. The colony was "annexed" in 1884 to Cape Colony, and is under the general control of the British Governor of that Colony. The revenue in 1889, including military grant, was \$445,085, and the expenditure \$308,315.

A tax of 10s. per annum is levied on every native hut, and 10s. on each wife of a native. The seat of administration is at Vryburg in Stellaland, a settlement originally formed by the Boers on the border of the Transvaal. There are good roads.

There is a weekly post to Cape Colony and Matabeleland. The chief of the protectorate is Khama, with whom is an assistant commissioner.

**BECK**, CHARLES, PH. D., LL. D., born in Germany in 1798, died in 1866, was a philologist, professor of Latin and Literature, 1882, at Cambridge, Mass. He published several works, among which was *The Manuscripts of the Satyricon of Petronius Arbiter Described and Collated*.

**BECK**, DAVID, born 1621, died 1656, was a Dutch portrait painter, who studied under Vandyke. He worked with great speed and was remarkably successful. He was employed by Charles I of England, and by Queen Christina of Sweden.

**BECK**, JOHANN TOBIAS, a distinguished German theologian, born at Balingen in 1804, died in 1878. The scene of his labors was Tübingen, where he studied theology, and where, as professor of theology for many years, he combated the negative criticism of the "Tübingen school" of Bauer; not so much, however, by direct controversy as by the development of a system of biblical divinity founded upon faith in the text.

**BECKER**, GOTTFRIED WILHELM, a German author born at Leipzig in 1778, died there in 1854. He studied medicine, and in 1801 settled in Leipzig as a practicing physician and a writer of medical works, several of which reached many editions. In 1833 he entirely relinquished the practice of medicine, and devoting himself to literature became a fertile and admired contributor to many of its more popular branches.

**BECKER**, KARL, a German artist, born at Berlin in 1820. His subjects are mostly historical, but are chosen with a view to the display of gaudy coloring or intricate architectural combinations.

**BECKER**, KARL FERDINAND, born at Leipzig in 1804, may be named with Kiesewetter and Winterfeld as one of the best German writers on the history of music, and also as an excellent composer for the organ, as is proved by his trios and other compositions well adapted to the genius of the instrument. Among his works may be mentioned a *Choral Book*, or collection of psalm and hymn tunes; a catalogue of his musical library one of the most extensive in Germany; *The Composers of the 19th Century*, etc.

**BECKERATH**, HERMANN VON, born in Krefeld, Prussia, in 1801, died there in 1870. He took a prominent part in the political affairs of Germany. When Frederick William IV ascended the throne, Beckerath, aroused to a sense of the political state of the country, devoted himself to effecting its constitutional freedom. In 1843 he was elected representative of his native town in the provincial diet, and until 1852 was an active participant in the politics of Prussia.

**BECKETS**, on shipboard, a general name for any large hooks, short pieces of rope, or wooden brackets, used for confining ropes, tackles, oars or spars in a convenient place.

**BECQUEREL**, ANTOINE CESAR, a well-known physicist, born in France in 1788, died in 1878. Through certain experiments made by him on the liberation of electricity by pressure, in a course of study concerning the properties of yellow amber, Becquerel made discoveries which overthrew Volta's theory of contact, and he himself constructed the first constant pile. He afterward discovered a method of ascertaining the internal temperature of the animal body, and by physical applications demonstrated that upon the contraction of a muscle there is a development of heat. He is one of the inventors of electro-chemistry, and originated a method of electrotyping. In connection with his son (Alexander Edmond, born at

Paris in 1820) he made interesting researches concerning the solar spectrum and electric light.

**BECSE**, the name of two towns of Hungary, known as Old Becse and New Becse. They are situated about eight miles apart, on the Theiss River, 50 miles south of Szegedin.

**BECSKEREK NAGY**, or **GREAT BECSKEREK**, a town of Hungary in the county of Torontal, situated on the left bank of Bega, about 45 miles southwest of Temesvar, with which place it is connected by a canal. It is an important market town. Population, 19,700.

**BED**, an article of household furniture on which to sleep. Beds are and have always been of various styles, nearly all countries having their own peculiar form. As far as has been ascertained, the people of ancient Palestine had a simple sort of couch suitable for resting on during the day, or sleeping on at night, being easily moved. In the European countries the bed is of an open couch form, affording accommodation for but one person. It is composed of a frame or bedstead (See *Britannica*, Vol. IX, p. 849), upon which are placed one or two mattresses of hair or wool, and curtains, which hang from the ceiling, often accompany it. The Germans frequently lay a large flat bag of down above the other covering for the sake of warmth. The American style is generally that of the French, the open couch form. The folding tressel-bed, frequently seen in America, is, next to the oriental rug spread out on the floor, the simplest bed yet invented. It is constructed on the plan of a camp-stool, with a movable head-board to retain the pillow.

**BED**, or **STRATUM**, is a layer of sedimentary rock of similar composition, and of some thickness, cohering so that it may be quarried and lifted in single blocks. Beds frequently consist of many fine laminae or plates. The laminae are the results of intermissions in the supply of materials produced by river-floods, the ebb and flow of the tide, and similar causes, or by the more or less turbid condition of the water under which they were deposited.

**BEDCHAMBER**, **LORDS OF THE**, are twelve officers in the royal household of Great Britain, who wait in turn upon the king's person. They are under the Groom of the Stole, who accompanies the sovereign only on state occasions. There are also thirteen grooms of the bedchamber, who attend in turn. In the reign of a queen, ladies fill these offices, which are objects of high ambition. See *Britannica*, Vol. XXI, p. 37.

**BEDEAU**, **MARIE ALPHONSE**, a French general, born at Verton, 1804, died in 1863. In 1817 he entered the military school, and in 1825 received a commission in the army. He was aid-de-camp to General Gérard in the Belgian campaign of 1831-1832. He was sent to Algeria in command of a battalion in 1836, and was for a time governor of Algeria in 1847. He was appointed minister of war by the provisional government in 1848, an office which he changed for the command of the city of Paris, and as a republican member of the national assembly he opposed Louis Napoleon. Bedeau was arrested, with Cavaignac and others in 1851, and went into exile.

**BEDEGUAR**, or **BEDEGAR**, a remarkable gall, frequently occurring on the branches of several species of roses, mainly of the sweet-brier, on which account it is sometimes termed sweet-brier sponge. It is produced by different species of gall insect, sometimes by *Cynips rose*. It is generally roundish in form, often having a diameter of an inch or more; it has a spongy and fibrous nucleus, containing numerous cells, in each of which is a small

larva; it has a shaggy exterior covered with moss-like, branching fibers, which change from a green to purple or red. It was at one time esteemed as a medicine. See *Britannica*, Vol. X, p. 44; Vol. XIII, p. 143.

**BEDELL**, **GREGORY THURSTON**, born at Hudson, New York, Aug. 13, 1817. His father was a clergyman, and the son, after graduating from Bristol College, Pa., and the Virginia Theological Seminary, became rector of Trinity Church, West Chester, Pa. (1841), and then rector of the Church of the Ascension, New York city (1843). He has been assistant bishop of Ohio, and bishop of the diocese. Several of his addresses have been published.

**BEDELL**, **GREGORY TOWNSEND**, born on Staten Island, N. Y., Oct. 28, 1793, died at Baltimore, Md., Aug. 30, 1834. He was educated at the Episcopal Academy in Cheshire, Conn., and at Columbia College. He became rector of the Episcopal Church at Hudson, and subsequently at Fayetteville, N. C., and at Philadelphia, Pa. At the latter place St. Andrew's Church was established through his labors. He was the author of religious works and musical compositions.

**BEDFORD**, a town of Indiana, county-seat of Lawrence county. The chief manufactures are of wool and lumber, and among the principal buildings are a fine court-house and town hall. Bedford is the seat of an academy, and of the Bedford Male and Female College.

**BEDFORD**, a prairie town of Iowa, county-seat of Taylor county, situated on the One-Hundred-and-Two River, about 100 miles southwest of Des Moines. It is the center of a fertile agricultural district.

**BEDFORD**, a town in Pennsylvania, located on a branch of the Juniata, about 100 miles west of Harrisburg. The manufactures are principally of iron, which is mined in the vicinity. About a mile distant is Bedford Springs, a fashionable summer resort.

**BEDFORD SPRINGS**, a summer resort in Pennsylvania, near the town of Bedford, noted for the valuable medicinal waters of its mineral springs, and for its cool summer climate and charming mountain scenery.

**BEDLAM** (corruption of Bethlehem), the name of a hospital for lunatics in London. It was originally founded by Simon Fitz-Mary, in 1246, "as a privy of canons for brethren and sisters." When the religious houses were suppressed by Henry VIII, it fell into the possession of the corporation of London in 1537, who converted it into an insane asylum. In 1675 the building was pulled down and a new one erected in Moorfields; the present one was built in 1814 in St. George's Fields. The building with its grounds covers an area of 14 acres, and is lacking in nothing likely to insure the comfort and promote the recovery of patients. In former times the management was deplorable. The patients were exhibited to the public like wild beasts in cages, at so much per head, and were made sport of by visitors. The funds not being sufficient to meet the expenditure, partially convalescent patients, with badges affixed to their arms, and known as "Bedlam Beggars," were turned out to wander and beg in the streets. This practice appears to have been stopped in 1675. Now the management of the patients is so excellent that annually many are returned as cured. See *Britannica*, Vol. XIII, p. 110.

**BEDLINGTON TERRIER**, a dog so named from a village and parish of Northumberland, one of the districts in which the race has been extensively bred. This dog is highly esteemed for its sagacity and speed, and for its wonderful courage. It is a good water dog, and has a marked dislike for all

kinds of vermin; it will unflinchingly attack even the fox, the otter or the badger.

BEDLOE'S ISLAND, the site of Bartholdi's statue of *Liberty Enlightening the World*, is situated in New York harbor, within the limits of the city of New York. It was named from a former owner. It became, in 1800, the property of the United States. In 1841 the government erected here a fort, known as Fort Wood, which mounted seventy-seven guns. The fort is now disused, and the statue occupies nearly the whole of its interior.

BEDMAR, DE, ALFONSO DE CUEVA, MARQUIS, born in 1572, died in 1655. He was appointed ambassador to Venice from the Spanish court in 1607, whereupon he entered into a bold and unscrupulous plot to destroy that city, through which act he has become lastingly notorious. (See *Britannica*, Vol. 24, p. 147.) Otway's popular and pathetic play, "Venice Preserved" is founded on this circumstance. Bedmar afterward became president of the council at Flanders, and in 1622 was created cardinal by the Pope. He subsequently went to Rome, after which he returned to Spain as Bishop of Oviedo.

BED OF JUSTICE, literally, the seat or throne occupied by the French monarch when he was present at the deliberations of parliament. Historically a bed of justice signified a solemn session in which the king was present to overrule the decisions of parliament, and to enforce the acceptance of edicts or ordinances which it had previously rejected. The last bed of justice was held by Louis XVI at Versailles in 1787.

BEDOS DE CELLOS, DON JEAN FRANÇOIS, a Benedictine monk, of the congregation of St. Maur, and the most learned and practiced master of the art of organ-building in the eighteenth century,

whose work on the art is of the greatest importance to the present day. He was born about 1714, at Chaux and died in 1797. He entered his order about 1726 at Toulouse, where he built several large and superior church-organs—was elected member of the Academy of Sciences in 1758, and completed for the Academy his great work, *L'Art du Facteur d'Orgues* in four volumes, large folio, with 137 copperplates, beautifully executed.

BED-SORES, a very troublesome complication of disease, to which, in many cases, a patient is liable through long confinement to bed, when unable or not allowed to change his position. When long confinement to bed is expected, attempts should be made to thicken the cuticle, and enable it to bear pressure better, by rubbing the skin with some stimulant, as spirits or *eau-de-cologne*.

BEDSTRAW, a genus of plants belonging to the natural order *Rubiaceæ*, and distinguished by a small wheel-shaped calyx and a dry two-lobed fruit, each lobe containing a single seed. The leaves as in the rest of the order, are whorled and the flowers minute, but in many of the species the panicles are large and many-flowered.

BEDWIN, GREAT, a town of Wiltshire on the Kennet and Avon canal, sixty-nine miles west-by-south of London. A fierce but indecisive battle occurred here in 674, between the kings of Mercia and Wessex. St. Mary's Church was built in the beginning of the fourteenth century and is constructed of flint, except the piers, arches, and dressings, which are of freestone. Jane Seymour, one of the queens of Henry VIII, was born here. In the end of the last century the remains of a Roman villa were discovered, included tesserae, bricks, a tessellated pavement, a huge leaden cistern, and the foundation of baths. Population, 2,068.

BEE ANATOMY AND BEE INDUSTRY. For the general subject of bees and bee culture in various countries, see *Britannica*, Vol. III, pp. 484-503. The illustrations herewith will properly supplement that portion of the article in Vol. III relating to the anatomy of bees. For convenience of reference, the illustrations are given in two plates. (See next page.)

BEE INDUSTRY IN THE UNITED STATES: The latest official government report (that of 1889), issued before these pages were sent to press, shows that among the minor branches of rural industry, bee-keeping is the most important. Every State and Territory reports bees and more or less honey, usually a hive or a few colonies for each farmer, rather than extensive apiaries and large production. In some localities, as in portions of New York, Ohio, Tennessee, Colorado, and California, where existing conditions are particularly favorable, apiculture is more prominent, dominating other industries in certain neighborhoods, though very rarely the leading branch over any considerable area. Honey and bees-wax are produced in every section of the country, and the aggregate value is very large, nearly equaling the value of the rice or the hop crop, and not much below that of buckwheat, and exceeding that of cane molasses, or of both maple syrup and sugar. It largely exceeds the aggregate value of all other vegetable fibers, excepting cotton.

The latest official record of production by States is the return of the national census for the year 1879. It made the honey production 25,743,208 pounds, and wax 1,105,689 pounds. After careful study of all available data of local values and mar-

ket prices, the average farm value of the honey was estimated at 22 cents per pound, and the wax at 33 cents, making the aggregate value of apiarian products, at the place of production, \$6,028,353. The product of the principal States in that year was as follows:

| States.             | Honey.         | Wax.           |
|---------------------|----------------|----------------|
|                     | <i>Pounds.</i> | <i>Pounds.</i> |
| Tennessee.....      | 2,130,689      | 86,421         |
| New York.....       | 2,088,845      | 79,756         |
| Ohio.....           | 1,626,847      | 56,333         |
| North Carolina..... | 1,591,500      | 126,268        |
| Kentucky.....       | 1,500,565      | 46,912         |
| Pennsylvania.....   | 1,415,003      | 46,610         |
| Illinois.....       | 1,330,806      | 45,640         |
| Iowa.....           | 1,310,138      | 39,365         |
| Virginia.....       | 1,090,451      | 55,200         |
| All other.....      | 11,678,184     | 524,984        |
| Total.....          | 25,743,208     | 1,105,689      |

Under the head of "all other," in the above statement, there is grouped the production of 36 States and Territories, ranging from 1,056,031 pounds of honey in Georgia to 50 pounds in Idaho.

Our foreign trade in honey has never been large, and the balance has fluctuated. During five years past our average annual exportation has been valued at only \$82,489 and importation at \$52,891, making the value of the net exportation only \$29,598. This little exportation goes principally to the United Kingdom, France and Germany, while our

foreign purchases come mainly from the West Indies and Mexico. The balance of trade is too small to affect the supply, and our domestic consumption is satisfied with our home production.

PLATE I. Fig. 1, the Queen Bee; 2, the Working Bee; 3, the Drone; 1a, 2a, 3a, the antennae; 1c, 2c, and 3c, the heads of queen, working bee, and drone; the head of the working bee is much flattened, as shown at 2c. A, the margins of two wings; B, the 18 or 20 hooks placed on the anterior portion of the hinder wing, while the posterior margin of the fore-wing is beautifully folded over to receive them, so that when employed in fanning for ventilation the two wings on each side act as one, and present an unbroken surface to the air. The wings of workers are larger than those of the queen, but those of the drones are much larger still. Fig. 2f, shows the inner side of the hind-leg and pollen brush; 2g, the outer side and pollen basket. On entering a flower a bee often covers itself with pollen, and hence the need of the brush apparatus to reach home. The pollen basket is peculiar to the worker; neither the queen nor drone has anything of the kind. 2c, back view of the head, showing the opening into the oesophagus.

PLATE I.

PLATE II. b, b, b, the muscles that move the wings; c, c, the bases of the wings, the appendages consisting of two pairs arranged to hook together. Fig. 3a the lobal palpi; 3a the maxillae provided with hairs and with two feelers midway, known as maxillary palpi. 4. The sting of the working-bee, with its muscles and attachments; r, shows the muscles that move the sting, and q, the curved base of the outer sheath by which it is enclosed; the outer sheath consists of two fleshy claspers (q in the figure), inside of which is the linear sheath which forms an essential portion of the sting, and consists of two horny scales closely adhering to the darts; these last are composed of stiff filaments, barbed at the outer end with from five to ten teeth on one side, and they slide within the inner sheath and that within the outer sheath on the principle of the tubes of a telescope. The darts are first protruded in the act of stinging, and, by aid of the powerful muscles on each side at s, are buried in the flesh to the depth of one-twelfth of an inch; the inner sheath then follows, and, at the

same time, by a muscular contraction, the poison is forced along the groove in which the dart works, causing the well-known painful effects which arise from the sting of a bee. These darts are of slightly unequal lengths, so that the teeth on each side are not opposite to each other. From this arrangement it is easier for them to penetrate the flesh until the poison has been ejected. If the sufferer could only command himself so as to remain passive, the bee might be able to draw in those darts which protrude beyond the sheath and would then be able to withdraw the sting, and consequently inflict less pain, and also escape paying the penalty of her own life by leaving the whole stinging apparatus behind. The sting is about one-sixth of an inch long. The ducts which secrete the poison are at 1c, and the poison bag or reservoir at 4f. The drone and queen have no stings.\*

PLATE II.

6a, two wax pockets or receptacles for wax, which constitute the animal fat of the bee. The wax is not connected with the stomach, but exudes through the pores of the abdomen. The secreting vessels are probably contained in the membranes which line these pockets. 1 and 2b, biliary vessels which receive the chyle from the digested food in the bee's stomach.

Figs. 1 and 2f, the honey bag, an extension of the gullet or oesophagus, in which (though often called the 2d stomach) no digestion takes place; when full, it is about the size of a small pea. The bag is lined with muscles, by which the bee can discharge the honey into the store cells or send it forward into the oesophagus or true stomach for its own subsistence. (1 and 2f). Fig. 7, a bee's egg; 8, a young bee in a chrysalis condition. Fig. 5, three of the 3,500 lenses in the eye of the bee, all of them converging toward a common center.

BEE-HIVES AND BEE-HOUSES. Numerous styles of these may be found in the various periodicals and hand-books devoted to the bee and honey industry of the country. Readers who propose to enter the business should furnish themselves with hand-

books, of which there are several of great practical value to the American public, and these hand-books should be supplemented by securing some live, current periodical which makes a specialty of the subject. The following cuts show a style much in use in countries of severe climates, especially in England and Scotland. They are covered with straw wrought in such manner as to combine beauty of finish with protection from cold.

BEE-HOUSE.

They can be made with or without supers, and so arranged as to be conveniently opened, carried or weighed. A sample of bee-house is also given, specially adapted to straw style of hive, but, suggestive of other styles adapted to various kinds of hives. The front and rear views are both given by which their method and convenience in use will be readily indicated.

BEE-HOUSE FOR 12 HIVES—FRONT VIEW.

BEE-HOUSE FOR 12 HIVES—BACK VIEW.

The annexed illustration shows the ornamental zinc cover, and renders but little description necessary. Three clumps of wood must be driven into the ground, and the three iron rods supporting the covering made fast to them with screws; there are screw-holes in the feet of the iron rods for the purpose. When thus secured, but little fear need be entertained of its being blown over by high winds.

In the roof two pulleys are fixed, so that, by attaching a cord, the upper hive covering the bell-glass supers may be raised with facility for the purpose of observing the progress made by the bees.

The ornamental zinc cover will form a pleasing object in the flower-garden when placed in a suitable position and neatly painted. Should the box style of hive be used, as is generally the case in most sections of the United States, a change in style of bee-house or cover will be at once suggested.

Next we insert an illustration suggestive of a convenient method of weighing hives, or sections of hives, of any form of construction.

**BEST METHOD OF MARKETING HONEY.**  
The following paper was read by Mr. Henry Segelken, of New York city, before the State Bee-Keepers' Association, at its meeting in Albany, Jan. 22-24, 1891, and is inserted by special permission. It supplies important information of great practical value to all interested in this rapidly growing industry:

For a 1-lb. section we recommend a single-tier crate, holding 24 or 25 sections. While we are not opposed to the double-tier crate, we believe the former is most desirable—at any rate for unglazed honey. If some of the combs in the upper tier start to leak, they will drop over the combs in the bottom rows and soil the whole crate.

Very often the shipper will figure the weight down to ounces, and mark the crate; for instance, gross, 28 lbs. 6 oz.; tare, 1 lbs. 4 oz.; net, 27 lbs. 2 oz. The 2 oz. we have to throw off every time—in fact, in some cases we are compelled to throw off quarters in order to effect a sale. All this can be, and should be, avoided by simply changing some of the combs

until the crate will weigh an even pound, or half pound, and by so doing he will receive pay for every ounce of honey. We would recommend to put only the *net* weights in plain figures on the end of the crates.

For glassed or unglassed honey we advise the use of heavy paper in the bottom of the crate, turned up about half an inch on the sides. If some of the combs should be broken down this will prevent the honey from leaking through the crates. In addition, it is advisable to lay strips of wood of about  $\frac{1}{2}$  inch in thickness upon the paper, from side to side, for the combs to rest on. This will prevent the honey dripping from the broken combs from soiling the good combs, of course, it is not necessary to go to this trouble when the honey is shipped in paper boxes.

For a paper box, we recommend those now used by nearly all the largest producers who use a paper box. It is made of heavy paste-board, and is strong enough to prevent breakage, unless the honey is handled unusually rough. Where honey is put up in paper boxes, we would advise the use of a crate holding 25 sections 5 by 5 (single-tier crate). The middle section on each side of the crate should be glassed, to show the quality of the honey. Honey put up in this style—clean, white crates, and boxes neatly labeled—will always sell at highest prices.

SINGLE-TIER CRATE.

"What part of the honey should be sent to market in paper boxes, glassed or unglassed?" Up to last year we have said, about one-third of each kind, as the demand was about equally divided. We now use 50 per cent. glassed, 30 per cent. paper boxes, and 20 per cent. unglassed, as near as we are able to estimate. During the season of 1889 we had more demand for glassed honey than for unglassed or paper boxes. We thought, perhaps, that year was an exception, but we have had more call for glassed honey this last season than the year before, and the demand for same is fast increasing. We could not nearly fill our orders for glassed honey this year, and could have sold thousands of crates more. We tried to substitute paper boxes and unglassed honey, but the trade would not have it in place of the glassed honey. We are of the opinion that this demand for glassed honey will be permanent, and we would therefore advise producers to glass more of their honey. It is certainly more profitable to glass the honey than to ship it in unglassed or in paper boxes. The producer receives the price of honey for every ounce of glass; besides, glassed honey will bring better prices than unglassed, and as good a price as paper boxes. The reasons why glassed honey has the preference seem to be these: The retailer can take every comb from the crate and make a handsome display of it (this, of course, can be done with the paper boxes, but the glass will show the quality of every comb); the dust cannot settle on the honey, and the glass will prevent inquisitive and curious customers from sticking their fingers in the comb.

Next comes the kind of section. For unglassed or paper boxes it does not matter which one is used—nailed, dovetailed or the one-piece section. For glassed honey we should say the nailed or dovetailed section is the most desirable, as the one-piece section does not seem to be strong enough to be glassed. Some producers will fasten the glass to the comb with small tin tags, others with small wire nails, and again others will glue them. Either method will answer the purpose if properly done. If glassed, a glue should be used which will *stick* and *hold* the glass to the section. We sometimes receive shipments of glassed honey glued, and as soon as touched the glass will fall from the sections and very often hurt the sale of the honey.

Another item of great importance is to have the sections weigh not over one pound each, and less if possible. Our market demands light weights at all times, be the honey glassed, unglassed, or in paper boxes. The latter two will generally weigh a little less than a pound, while glassed sections will in many cases weigh over one pound, especially if the standard section is used— $1\frac{1}{2}$  by  $1\frac{1}{2}$  by  $1\frac{1}{2}$ . We would advise producers to cut the section down in width and adopt a smaller one, say one  $1\frac{1}{4}$  by  $1\frac{1}{4}$  by  $1\frac{1}{2}$ , or even  $1\frac{1}{4}$ , so that when glassed the section will not weigh over 11 to 12 ounces. Heavy sections are generally rejected, and we find it slow work in moving them off.

For extracted honey—basswood, white clover or buckwheat—we prefer a keg of about 150 lbs., half barrel of about 300 lbs., or even barrels of 500 lbs., whichever can be obtained cheapest. We would not advise the use of 60-lb. square tins as used exclusively in California. Our trade is accustomed to the wooden packages for all kinds of northern, eastern, southern and western honey, and we see no necessity for a change. The cans are more expensive than kegs or half barrels; the honey in cans will not sell for any higher price consequently nothing can be gained.

The shipping of comb-honey should be by freight altogether. We would advise shippers to load the honey in the cars themselves, properly protected. If this is done they may feel sure that the honey will arrive at its destination in good order under ordinary circumstances. Another point is that honey should be shipped only in original crates.

We would call your special attention to the *grading* of the honey, which is as important a question as any of the former, and in which too much care cannot be taken. Very often we receive honey which is not properly graded, and where off-grades are mixed in with the first-grade and marked No. 1 white honey. The outside combs will appear all right, but inside of the crate will be the poorer grade. We cannot take the trouble to open and examine every crate and comb, but have to rely on the shipper and go by the mark and the appearance of the crate. We sell and ship the honey, and the first thing we know, the party who bought it will complain about the quality and hold the honey subject to our order, and we must either have the honey shipped back to us or make an allowance satisfactory to the buyer. The shipper is also dissatisfied, as generally he expects highest market prices, and often will not admit that the honey was not properly graded, while no one but himself is to blame. All this can be avoided if the honey is properly graded.

Two grades of white honey are sufficient for our markets. For "fancy white," select only what is fancy white. For a second grade or "fair white," take combs that are stained or a trifle off in color, and combs scantily filled around the edges. Any combs mixed with dark or buckwheat honey should not be put in with the second grade. Such honey cannot be sold for white honey, and will not sell for more than buckwheat. In fact, a straight buckwheat finds better sale than mixed honey. This should be crated by itself and marked "mixed" or "dark" honey.

Our market demands a limited quantity of 2-lb. sections. About 10 per cent. of the honey we receive is in 2-lb. sections, which is sufficient to supply the demand. They should be glassed altogether and put in crates holding 12 or 15 sections.

Last, but not least, "What is the right time to ship comb-honey to market?" We have always advised early shipping, say during September and first part of October. Our experience teaches us that the early shippers obtain best prices and get quickest returns, be the crop large or short. In all our experience we have never known the market to advance during November and December, but it usually declines as the season passes along.

**BEES AND BEE-KEEPING.** For an elaborate, practical, highly interesting article on this subject, see *Britannica*, Vol. III, pp. 484-503. It is estimated that there are in the United States over 70,000 beekeepers. The latest statistics giving a comparison of production for different countries are those of 1886, furnishing the following summaries:

| Countries.          | No. of hives. | Weight of honey in lbs. |
|---------------------|---------------|-------------------------|
| France .....        | 950,000       | 28,000,000              |
| Germany .....       | 1,454,000     | 40,000,000              |
| Russia .....        | 110,000       | 2,000,000               |
| Austria .....       | 1,550,000     | 40,000,000              |
| Belgium .....       | 200,000       | 5,000,000               |
| Holland .....       | 240,000       | 6,000,000               |
| Denmark .....       | 90,000        | 2,000,000               |
| Greece .....        | 30,000        | 3,000,000               |
| United States ..... | 2,800,000     | 62,000,000              |
| Total .....         | 7,424,000     | 184,000,000             |

Mr. Harbison, of California, was then reported as being the largest bee-owner in the world, having 6,000 hives, producing 200,000 pounds of honey yearly, valued at about \$40,000.

**BEECHER, CATHERINE ESTHER**, eldest child of Lyman, born at East Hampton, Long Island, Sept. 6, 1800, died at Elmira, N. Y., May 12, 1878. She was educated at Litchfield Seminary. Her betrothed lover, Prof. Fisher of Yale, was drowned while on a voyage to Europe, and her sorrow was so great that, according to her brother, Henry Ward, her religious faith was almost shipwrecked, and she only found relief by plunging into a life of great activity. The cause of female education was very dear to her heart, and in 1822 she started a school at Hartford, Conn., for young ladies. For ten years the school was carried on, and Harriet Beecher assisted in the teaching. The institution

prospered, and 160 pupils were in attendance. She was the author of some school-books, several works on the woman question, and a number of books on religion. She believed and taught that physical and moral training should receive the same attention as intellectual development. For two years she conducted a school in Cincinnati, O. She assisted ex-Governor Slade, of Vermont, in a plan for supplying women teachers in the great West. Miss Beecher was an intensely practical woman, earnest, patient, energetic, and of great good-humor. She did not approve of classical and modern music, neither was she an admirer of art. For many years she worked under the disadvantage of great physical weakness. In her youth she was a Presbyterian, but in after years she became a member of the Episcopal church.

**BEECHER, CHARLES**, son of Lyman, born at Litchfield, Conn., Oct. 7, 1815. He was educated at the Boston Latin School, the Lawrence Academy at Groton, Mass., Bowdoin College, and Lane Seminary. He became a minister and was installed pastor of the second Presbyterian church at Fort Wayne, Ind., in 1844. The First Congregational Church, of Newark, New Jersey, was his next charge; and from here he went to the First Congregational Church in Georgetown, Mass. He spent seven years in Florida, and on his return was made pastor of a church at Wysox, Pa. Mr. Beecher is a fine musician, and assisted in compiling the *Plymouth Collection of Hymns and Tunes*. He has published *David and His Throne*, *Pen Pictures of the Bible*, *Autobiography and Correspondence of Lyman Beecher*, and a few other works.

**BEECHER, EDWARD**, son of Lyman, born at East Hampton, L. I., Aug. 27, 1803. He graduated at Yale in 1822, and studied theology at Andover Theological Seminary and at New Haven. He was called to the Park Street Church, of Boston, where he remained for four years, and then was tendered the presidency of Illinois College at Jacksonville. Subsequently he was pastor of the Salem Street Church in Boston, and the Congregational Church at Galesburg, Illinois. Chicago Theological Seminary called him to the chair of exegesis. In 1872 he left the ministry and removed to Brooklyn, N. Y. He has been a constant writer for journals, and was editor of the "Congregationalist" for six years. He wrote two books, *Conflict of Ages*, and *Concord of Ages*, which created considerable discussion from the fact that he advanced the theory that "man's present life is an outgrowth of a former life as well as a prelude to a future one." He has published sermons, addresses and several religious books.

**BEECHER, EUNICE WHITE BULLARD**, wife of Henry Ward Beecher, born at West Sutton, Worcester county, Mass., Aug. 26, 1812. She received her education at Hadley, Mass., and after a seven years' engagement she married Mr. Beecher and went to live in Lawrenceburg, Ind. In her early married life she wrote the story, *From Dawn to Daylight*. She has since published *Motherly Talks with Young Housekeepers*, *Letters from Florida*, *All Around the House*, and *Home*, and since her husband's death she has been engaged on a series of articles for the "Ladies Home Journal," entitled, *Mr. Beecher as I Knew Him*.

**BEECHER, GEORGE**, son of Lyman, born at East Hampton, L. I., May 6, 1809, died at Chillicothe, Ohio, July 1, 1843. He was a graduate of Yale, studied theology, and served successively as pastor of Presbyterian churches at Rochester, N. Y., and Chillicothe. His death was caused by the accidental discharge of a gun.

**BEECHER, HARRIET**. See **STOWE, Harriet Beecher**. In these Revisions and Additions.

**BEECHER, HENRY WARD**, the most famous son of Lyman Beecher, born at Litchfield, Conn., June 24, 1813, died at Brooklyn, N. Y., March 8, 1887. His studies were pursued at the Boston Latin School, Mount Pleasant Institute, Amherst College, and Lane Seminary. He was first installed as pastor of the Presbyterian Church at Lawrenceburg, Ind., in 1837. About this time he married Eunice White, the daughter of Dr. Artemas Bullard. From 1839 to 1847 he preached at Indianapolis, and then was called to the pastorate of the new Congregational Church at Brooklyn, N. Y. Mr. Beecher soon acquired the reputation of being a great pulpit orator. He had a flexible voice, was fond of using illustrations, his good-humor was inexhaustible, and he was fearless in denouncing social and political evils. All these qualities contributed to make the pastor of Plymouth Church exceedingly popular. In 1882 Mr. Beecher disavowed his belief in eternal punishment. As a platform lecturer Mr. Beecher's services were in great demand, and his sermons were for years published under the title of *Plymouth Pulpit*. He was an active supporter of the Republican party until 1884, when he voted for the Democratic nominee for the presidency. At the centennial anniversary of the birth of Robert Burns (Jan. 1859), Mr. Beecher was requested to deliver the oration, and this has been considered one of his most eloquent speeches. He delivered the oration at Fort Sumter in 1865, on the anniversary of its surrender. In 1878 he was elected chaplain of the 13th Regiment, National Guards, State of New York. When Henry W. Sage founded the "Lyman Beecher Lectureship" in Yale, Mr. Beecher gave the first three courses. In 1874 arose the "Tilton and Beecher scandal," which, when brought into church trial, resulted in Mr. Beecher's favor. Mr. Tilton carried the matter into the civil courts, but the jury disagreed, standing nine to three in Mr. Beecher's favor. Mr. Beecher at one time edited the "Cincinnati Journal," and afterwards the "Farmer and Gardener," the "New York Independent" (for about 20 years) and the "Christian Union." His list of published books is a long one. Some of the best known are *Star Papers*, *Lectures to Young Men*, *Aids to Prayer*, *Norwood* (a novel), *Yale Lectures on Preaching*, and a *Life of Christ*. He printed the *Plymouth Collection of Hymns and Tunes*, and from his pulpit discourses were compiled the books, *Life Thoughts*, *Notes from Plymouth Pulpit*, *Comforting Thoughts*, and others.

**BEECHER, JAMES CHAPLIN**, son of Lyman, born at Boston, Mass., Jan. 8, 1828, died at Elmira, N. Y., Aug. 25, 1886. He graduated at Dartmouth in 1848, and afterwards pursued his theological studies at Andover, being ordained a Congregational minister in 1856. He was chaplain of the Seamen's Bethel in Canton and Hong-Kong, China, until 1861, and in 1861-62 chaplain of the first New York Infantry. He was lieutenant-colonel of the 141st (1862-63), colonel of the thirty-fifth U. S. colored troops (three years), and in 1866 was mustered out of service as brevet brigadier-general. After the war he held pastorates at Owego, Poughkeepsie and Brooklyn, N. Y. He became insane, and after three years of suffering committed suicide at Elmira.

**BEECHER, LYMAN**, born in New Haven, Conn., Oct. 2, 1775, died in Brooklyn, N. Y., Jan. 10, 1863. He was the descendant of a New England family, whose original ancestors settled in New Haven in 1638. His father was a blacksmith, and, in consequence of his mother's death, he was adopted by his uncle, Lot Benton. Rev. Thomas Bray fitted him for college, and he graduated from Yale in 1797. Having pursued the study of theology during his

college term, he was licensed to preach a year later, and began his clerical labor in the Presbyterian Church at East Hampton, L. I., where he remained for eleven years. He had married Roxana Foote, and, as his salary was only \$400 a year, his wife taught a private school to assist in the support of the family. He was obliged to resign his charge and move to Litchfield, Conn., where he could get a better salary. Here he remained for sixteen years, winning fame by his eloquent sermons and his fearless denunciations of intemperance. The Hanover Church of Boston called him to its pastorate. This was a time of religious controversy, for Dr. Channing had broken with Congregationalism, and many people were following his lead. In this controversy Dr. Lyman Beecher took an active part, warmly upholding Puritan doctrine. After remaining here six years he was called to the presidency of the new Lane Theological Seminary, near Cincinnati and the pastorate of the Second Presbyterian Church of that city. The question of slavery began to be discussed in the seminary, and, as many of the students were from the South, the debate became violent. The trustees forbade further discussion, and all the students left the seminary. Some were induced to return, but this secession destroyed the prosperity of the seminary, and Dr. Beecher was unable to build it up again. In 1835 he was tried on the charges of heresy and hypocrisy by some of the more rigid Calvinists, but was acquitted. Leaving Lane Seminary in 1842, he returned to Boston and gave up his time to the revision of his books. The last years of his life were spent in Brooklyn, at the home of Henry Ward Beecher. He was famous for the boldness with which he denounced intemperance and other evils of the times. Among his publications are: *Remedy for Drunkenness*, *Six Sermons on Temperance*, *Skepticism*, *Political Atheism*. He was three times married, and was the father of thirteen children, most of whom achieved distinction.

BEECHER, THOMAS KINNICUT, son of Lyman, born at Litchfield, Conn., Feb. 10, 1824. His education was completed at Illinois College, of which his elder brother, Charles, was then president. After graduating, he was successively the principal of the Northeast Grammar School at Philadelphia (1846-48), and the Hartford High School in Connecticut. In 1852 he was installed pastor of a Congregational Church at Brooklyn, N. Y. Two years later he removed to Elmira, N. Y., where he was given the care of the Congregational Church. Mr. Beecher has traveled in Europe, South America and California; has published a book entitled, *Our Seven Churches*, and served four months in the Army of the Potomac, as chaplain of the 141st New York volunteers, in 1863. He has been a frequent contributor to the "Elmira Advertiser," and is quite a popular lecturer. He is a well-known philanthropist, unsectarian and fraternal with regard to other Christian denominations.

BEEDEE, the capital of a district of the same name in the Nizam's territories, about seventy-five miles to the northwest of Hyderabad, being in latitude 17° 53' north, and longitude 77° 36' east. It stands near the right bank of the Manjera, a considerable tributary of the Godavary, and occupies a table land about 2,400 feet above the sea, and 100 feet above the adjacent country. Though it was formerly a place of grandeur and importance, yet it is at present chiefly remarkable for its manufactures in a compound metal made up of twenty-four parts of tin to one of copper.

BEE-EATER (*Meropis*), a genus of birds found in Asia, Africa, and Southern Europe. They are nearly allied to the kingfishers, have rather long,

slightly arched beaks, long, pointed wings, and are mostly of a green color. In flight they resemble the swallow, and, like that bird, they feed on insects, but chiefly on bees and wasps.

BEEF-EATERS, a term applied to certain English functionaries, the yeomen of the Royal Guard, who have formed part of the train of the sovereign since the time of Henry VII, on state occasions. The wardens of the Tower of London are well known as "the Queen's Beef-eaters." Their costume or livery has been the same for four centuries, with the exception of some slight changes made in 1858.

BEEF-EATERS, a genus of birds of the order *Insectores*, tribe *Corvirostræ*, to which the name ox-pecker is more correctly given. They have short bills, square at the base, and rather swollen at the point. They are accustomed to sit on the backs of buffaloes, camels, and other large animals, and feed upon the larvae of gaddies, which they find in their hides. They are exclusively African. Livingstone mentions that, the sight of the bird being much more acute than that of the buffalo, it is much more easily alarmed by the approach of danger, and the buffaloes always begin to look about when the birds rise from their backs.

BEEF, SUPPLY OF, IN THE UNITED STATES. See Britannica, Vol. 1, pp. 387-91. The United States official statistics show a gradual increase both in number of cattle and beef products. In 1889 the total number of cattle was 49,417,101, and a large increase for every year of the decade. The number of milch cows was 15,300,934, and of other cattle 34,116,167. The number and value of beef cattle and value of beef products exported to other countries during the same year had reached the following totals: Number of live cattle exported, 140,208; number of pounds of canned beef, 51,025,254; fresh beef, 137,895,391; salted or cured beef, 55,200,435; tallow, 77,844,555; these products having a total value of \$22,860,240.

Mulhall's Dictionary of Statistics, issued in 1886, reported the figures of the following comparative table of production and consumption of beef per annum in various countries of the world:

| Countries.                                 | Production in tons. | Consumption in tons. | Consumption, pounds per inhabitant. |
|--------------------------------------------|---------------------|----------------------|-------------------------------------|
| United States . . . . .                    | 1,750,000           | 3,060,000            | 62                                  |
| United Kingdom . . . . .                   | 666,000             | 1,640,000            | 52                                  |
| France . . . . .                           | 550,000             | 1,210,000            | 40                                  |
| Germany . . . . .                          | 785,000             | 1,305,000            | 40                                  |
| Russia . . . . .                           | 1,050,000           | 1,920,000            | 21                                  |
| Austria . . . . .                          | 655,000             | 1,090,000            | 37                                  |
| Italy . . . . .                            | 165,000             | 295,000              | 12                                  |
| Spain and Portugal . . . . .               | 170,000             | 160,000              | 16                                  |
| Belgium . . . . .                          | 82,000              | 190,000              | 41                                  |
| Holland . . . . .                          | 95,000              | 98,000               | 42                                  |
| Denmark . . . . .                          | 80,000              | 76,000               | 31                                  |
| Sweden and Norway . . . . .                | 150,000             | 196,000              | 48                                  |
| Greece . . . . .                           | 12,000              | 31,000               |                                     |
| Roumania, etc. . . . .                     | 160,000             | 300,000              |                                     |
| Canada . . . . .                           | 165,000             | 198,000              | 52                                  |
| Total in Europe, Canada, and U. S. . . . . | 6,505,000           | 12,169,000           |                                     |

The same authority estimates the production of beef in Australia and in the Argentine Republic in the same year at 650,000 tons. See also Food and Meat, in these Revisions and Additions.

BEEF TEA, a light and pleasant article of diet, principally for the sick, is made from lean beef cut into small pieces and allowed to stand some time in cold water, and then set over a slow fire, where

it will simmer without boiling. A little salt should then be added.

**BEEHIVE-HOUSE**, or *Hut*, the name popularly applied to dome-shaped buildings in Ireland, considered the most ancient architectural remains in that country. They are round, of medium size and height, constructed of long, thin stones arranged,

BEEHIVE-HOUSES.

without cement, in horizontal layers slightly overlapping, and so gradually converging until they meet at the top. The square-headed doorway, as in the Egyptian style, narrows toward the top. See *Britannica*, Vol. II, p. 384; Vol. III, p. 397.

**BEER**, ADOLF, an Austrian historical writer, born in Moravia in 1831. He was professor of history successively in several institutions of learning, notably the technical high school in Vienna, where most of his historical works, and the results of his extensive travels, have been written.

**BEER-MONEY**, a peculiar payment to private soldiers in the English army. It was established in 1800, at the suggestion of the Duke of York, and consisted of one penny per day for troops when on home-service, as a substitute for an issue of beer and spirits. It still continues as an addition to the daily pay, and something in the mode of keeping military accounts induces the authorities to allow it to figure as a separate item, instead of being consolidated with the other elements of a soldier's pay.

**BEERSHEBA SPRINGS**, a fashionable watering place of Tennessee, situated on a spur of the Cumberland Mountain, near McMinnville. It is noted for its saline and chalybeate springs and its beautiful scenery.

**BEESHA**, a genus of grasses with the habit and most of the characters of bamboos, but remarkable for the fleshy pericarp which incloses the seed, forming a sort of berry. The species are few and are natives of the East Indies.

**BEESTINGS**, sometimes written *BIESTINGS*, the first milk yielded by a cow after calving; also formerly applied to the disease caused by drinking such milk.

**BEESWAX**, the wax which is secreted by bees, and of which their cells are constructed. See *Britannica*, Vol. III, p. 486; Vol. XXIV, p. 459.

**BEESWING**, a film which resembles the wing of a bee, and which appears upon certain old wines, especially port. The wine itself is often called *beeswing*, or is said to be *beeswinged*, referring to its age.

**BEET-FLY**, an insect which infests crops of mangold-wurzel, and other kinds of beet, depositing its eggs on the leaves, the soft parts of which the larvæ devour, causing them to assume a blistered appearance, and, when numerous, injuring the health of the plants. It is a two-winged insect of the family *Muscidae*, but not so large as the common house-fly.

**BEETLE-STONES**, the name given by the lapidaries of Edinburgh, to hard nodules of clay iron-

stone, found abundantly in a low cliff, composed of shale, at Newhaven, near Leith, or strewn upon the beach in that neighborhood. They take a beautiful polish, and have been employed to make letter-weights, and other ornamental articles. Some of the nodules contain fossil fish, and some a fossil of vegetable origin. See *COPROLITES*, *Britannica*, Vol. VI, p. 353.

**BETTLING**, a finishing mechanical process, applied originally to linen shirting, and afterwards to cotton shirting, in imitation of linen, to give the cloth a hard and wiry look, by flattening the yarn irregularly in an angled manner. Bettling is likewise a process in flax-dressing, to separate the woody from the flexible fibers of the plant.

**BET-ROOT SUGAR**, the sugar which is obtained from the beet, but which, although similar to cane sugar, is inferior in sweetening power. Beet root contains an average of about ten per cent. of saccharine matter, and sugar-cane eight percent. more; the white Slesvig beet yields the best sugar. See *Britannica*, Vol. I, p. 381; Vol. XXII, pp. 626, 627.

**BET SUGAR**. In 1889-90 the total yield of beet sugar for the year was over 3,600,000 tons. The German product was 1,250,000 tons, the French 750,000 tons, Russia 480,000 tons, Austria-Hungary 730,000 tons. The total product was nearly 50 per cent. more than that of 1887-88. Only a small amount of the total product was reported by the United States. Indeed, the sugar-beet culture in this country is only just beginning as a great industry. The immediate future, however, is full of promise. Investigations by the Agricultural Department in Washington in respect to the production of sugar from the sugar-beet have been of the most extensive nature. During the early spring of 1890, 5,000 packages of sugar-beet seed of the most approved varieties were obtained from European growers and sent to all persons in the country who had applied for them. Arrangements were also made by which the beets, after maturity, could be sent to the Department for analysis. As a result of this arrangement beets were received from about one thousand different localities in all parts of the country, and these were analyzed in the laboratory. The results of the analysis are, for the most part, extremely favorable, especially with those varieties which came from the northern and central portions of the country. It is not uncommon to find beets containing 15 per cent. of sugar, while in exceptional cases the percentage of sugar has risen as high as 20. Many beets were found of a strictly typical character, combining a perfect shape with the proper weight and a high content of sugar. A typical sugar-beet is conical in shape, smooth in its external contour, with a white, solid interior, weighing about one pound, and having a content of sugar of about 14 per cent. Many samples of such beets were received by the Department, showing that it is possible to produce in the United States sugar-beets of the highest type.

A large beet sugar factory has been erected at Grand Island, Nebraska, equipped with the most approved modern machinery, and this factory is now working sugar-beets at the rate of 300 tons per day. There is every reason to believe that the encouragement which has been extended to the sugar-beet industry, by the investigations of the Department and by act of Congress, will result ere long in the establishment of many additional sugar factories in those portions of the country which the data obtained by the Department show to be best suited for the purpose. When it is considered that 250 beet sugar factories of the size and capacity of those now in operation in California and Nebraska

will be sufficient to make *one-half* of the total sugar consumed in the United States, it is not idle to expect that in the course of a few years a large proportion of the sugar consumed in this country will be made from the sugar-beet.

An intelligent observer of the rapidly growing interest now developing in several States on this subject, expresses the opinion that in five years the people of the United States will produce all the sugar needed for the home supply.

BEETS, NICOLAES, a Dutch poet, was born at Haarlem in 1814. He became pastor of a church at Heemstede, in 1838; in 1851 he removed to Utrecht, where, in 1875, he was appointed to the chair of theology in the university. Besides his poems he is the author of numerous literary and religious works. See *Britannica*, Vol. XII, p. 98.

BEFFANA, a corruption of *Epiphania* (Epiphany), and the name applied to a peculiar Italian custom prevailing on Three Kings' Day, or Twelfth Night. Tradition says that the Beffana was an old woman who, being busily engaged in house-cleaning when the three wise men of the East passed by on their way to offer their treasures to the infant Saviour, excused herself for not going out to see them, on the ground that she would have an opportunity of doing so when they returned. She, not knowing that they went home by another road, has been ever since watching for them. She is supposed to take a great interest in children, who, on Twelfth Night, are put to bed early, a stocking of each being hung before the fire. Soon the cry *Ecco la Beffana* is raised, when the children jump up and seize their stockings, each of which contains a present bearing some proportion in value to the conduct of the child during the year. One whose behavior has been particularly bad finds his stocking filled with ashes, in token of the Beffana's displeasure. There was a custom in Italy of carrying an effigy called the Beffana, on Twelfth Night, in procession through the streets, with much demonstration; it was probably the relic of one of the "mysteries" of the Middle Ages.

BEFFROI, the name of a tower used in the military sieges of ancient or mediæval times. When a town was to be besieged, this beffroi, which was movable, and as high as the walls, was brought near it. These towers were to cover the approach of troops, the highest being from twelve to fifteen stories, or stages, placed upon six or eight wheels. They were often covered with rawhides to protect them from the boiling grease and oil directed against them by the besieged. At the top there was a hinged drawbridge, to let down upon the parapet of the wall to aid in landing. Cæsar used this tower in his campaigns in Gaul.

BEG, or BEY, a Turkish title, rather vague in its import, and commonly given to superior military officers, ship-captains and distinguished foreigners. More strictly it applies to the governor of a small district, who bears a horse-tail as a sign of his rank. "Beglerbeg," or, more correctly, Beilerbegi (lord of lords), is the title given to the governor of a province who bears three horse-tails as his badge of honor, and has authority over several begs, agas, etc.

BEGGAR, one who solicits charity from the public. The word is supposed to have some connection with the fraternity known as Beghards. Begging, however, became so conspicuous a feature among these mendicant orders that the term originally applied to their sacred duties seems early to have acquired its modern vulgar acceptance. In a civilized, industrious country, the beggar, to have any chance of relief, must succeed in making the impression, whether true or false, that he is in actual

need of alms to keep him from starving. Among Oriental nations, on the other hand, this class is rather considered as endowed with the privilege of taxing their fellow-men than as objects of compassion. It has sometimes been supposed that a residue of this feeling of superiority characterizes the mental physiology of the mendicant of civilization, and that, abject as he seems, he considers himself to some extent a privileged person entitled to support without toiling as do the working classes. In Europe, during the Middle Ages, those doctrines of Christianity which teach the abjuration of selfishness and worldly-mindedness were exaggerated into profession of total abstraction from worldly cares and pursuits. Hence arose the large body of religiousists, who, as hermits, or members of the mendicant orders, lived on the contributions of others. Later on these orders became the proudest and richest of the clergy; but while the chiefs lived in affluence the practices of the lower adherents fostered throughout Europe an injurious system of mendicancy.

BEGGAR-MY-NEIGHBOR, a game of cards usually played by two persons, between whom the cards are divided.

BEGHARMI, or BAGIRMI, a country of Central Africa, about 240 miles in length, and 150 miles in breadth. Begharmi proper is flat, slightly inclining toward the north, its general elevation being about 1,000 feet above sea level. From the numerous deserted villages in the country it appears that the population was once much greater than at present. The people are grossly superstitious; many are pagans, although Mohammedanism has been introduced among them.

BEGKOS, or BEIKOS, a large village of Anatolia, on the Bosphorus, eight miles from Scutari, said to be the place of the contest between Pollux and Amycus, in which the latter was killed. At the commencement of the Crimean war the allied fleets anchored in Begkos Bay, prior to their entering the Black Sea in 1854.

BEGONIA, a genus of exogenous plants, typifying the natural order *Begoniaceæ*, and found in nearly all warm regions. The various species are extensively cultivated on account of the brilliancy of their flowers. The stalks of certain species are used in cookery. Some species, also, are used as purgative medicines. See *Britannica*, Vol. XII, p. 265.

BEGONIACEÆ, a natural order of exogenous plants, named in honor of Michael Bégon, a French patron of science. They are herbaceous, with alternate leaves, which are oblique at the base and have large dry stipules; the flowers are in cymes, unisexual, the perianth colored, with four unequal divisions in the male flowers, and five or eight in the female; the stamens are numerous; the fruit is membranous, winged, three-celled, bursting by slits at the base, the seeds minute. The order contains 160 known species, all of which have pink flowers.

BEGONIELLA, a genus of exogenous plants of the natural order *Begoniaceæ*, indigenous to the United States of Colombia.

BEG-SHEHR, a fresh-water lake of Asia Minor Karamania, 44 miles southwest of Koniye, pro-

BEGONIACEÆ.

sumed to be the ancient *Caralitis*. It is about 20 miles long and from 5 to 10 miles broad. It contains many islands and discharges itself by a river of the same name into Lake Soglah. On its east and north shores are the towns of Begshehr and Kereli, the old *Caralio*, which issued imperial coins, and which is also supposed to have occupied the site of Pamphylia.

**BEGTASHI**, a religious order in the Ottoman Empire, which had its origin in the 14th century. The name is believed to be derived from that of a celebrated dervish, Hadji Begtash, to whom also the order appears to owe its institution. The members use secret signs and pass-words resembling those of Freemasonry. Although numbering many thousands of influential persons in its ranks, the society does not appear to exercise any material influence in the religion or politics of Turkey.

**BEGUM**, a princess or lady of high rank in the East Indies. The term was brought into prominence among English-speaking people by the trial of Warren Hastings; one of the charges against whom was that of cruelty to two begums, who, being offered by him the alternative of lifting their veils before a stranger or losing their wealth, religiously chose to give up their treasures.

**BEHALM, MARTIN**, a well-known navigator. See **BEHEM**, *Britannica*, Vol. III, p. 509.

**BEHAM, BARTHEL** (1502-1540), a German artist whose earlier works are quite in the manner of Albrecht Dürer. His portraits of the Emperor Charles V and his brother, the Emperor Ferdinand I, are well known for their fine conception and masterly treatment.

**BEHAM, HANS SEBALD** (1500-1550), a German artist, brother of Barthel, from whom he first received instructions in painting and engraving, and then of Albrecht Dürer. He possessed singular powers of invention, generally exercised on secular, and often on coarsely humorous subjects, occasionally also on those of a vulgar and indecorous class.

**BEHM, DR. ERNST**, a German geographer, born at Gotha, Jan. 4, 1830, died there March 15, 1884. In 1856 he became Dr. Petermann's chief assistant in editing the famous geographical periodical, *Mittheilungen*, to the editorship of which he succeeded on his chief's death in 1878. In 1872 he commenced, in conjunction with H. Wagner, the useful *Bevolkerung der Erde*, intended as a statistical supplement to the *Mittheilungen*; and from 1876 he had charge of the statistical department of the *Almanach de Gotha*.

**BEIIRING**. See *Britannica*, Vol. III, pp. 509-10; and Vol XIX, p. 318. See also **BERING**, **IVAN IVANOVICH**, in these Revisions and Additions.

**BEILAN**, a pass and town in the northern extremity of Syria, on the east shore of the Gulf of Iscanderoun. It is one of the two passes, supposed to be the lower one, mentioned by Cicero as capable of easy ascent on account of their narrowness. There seems to be no doubt that in the war between Darius and Alexander the Beilan Pass was an important consideration to both commanders. It has a population of 5,000, many of whom are wealthy, and is much esteemed for its salubrity and fine water, which is supplied by numerous aqueducts. It was a scene of battle between the Egyptians and Turks in 1832, when the latter were defeated.

**BEIRAM**, or **BAIRAM**, a Mohammedan festival, somewhat analogous to Easter. See *Britannica*, Vol. III, p. 246.

**BEIT**, an Arabic word, signifying house, abode or place, the equivalent of which in Hebrew is *Beth*. Thus we have in the former language *Beit-al-Haram*, "the house of the sanctuary," or "the sacred house," and in the latter *Beth-el*, "house of God."

**BEITH**, a thriving inland town in the county of Ayr, Scotland, nine miles southwest of Paisley. Here cotton and muslin are manufactured, and in the neighborhood the famous Dunlop cheese is made.

**BEITULLAH** (Arab., House of God), the spacious building or temple at Mecca, which contains the Kaaba.

**BEJAN**, the name of the first or "freshman" class in some of the Scotch universities, and, of old, in many on the continent. The word is believed to be derived from the French *bec-jaune*, or yellow neb, a term used to designate a nestling or unfledged bird. In the University of Vienna the *bejan* was called *beanus*, a word of the same meaning and no doubt the same origin.

**BEJAPUR**. See **BIJAPUR**, or **BIJAIPUR**, *Britannica*, Vol. III, p. 669.

**BEKAA**, the Coele-Syria of the ancients, the "Plain of Lebanon" of the old Testament, and El Bekaa of the natives of Syria. It is inclosed between the parallel ranges of Lebanon and Anti-Lebanon, and is the richest and most beautiful plain of Syria, but although the soil is good and water abundant from the numerous mountain springs, a very small portion of it is cultivated.

**BEK, ANTHONY**, Bishop of Durham from 1283. He took a prominent part in the Scottish wars of Edward I, and held a command at the battle of Falkirk. In 1300 he became involved in ecclesiastical disputes, which lasted till his death, March 3, 1311. He was a prelate of great magnificence and unbounded ambition.

**BETASHI**, a mendicant order of dervishes, which had its origin in the 14th century.

**BELAYING**, one of the many modes of fastening ropes on shipboard. It is effected by winding a rope, generally a part of the running rigging, round a piece of wood called a cleat or a kevel, or else round a belaying pin, which is an ashen staff from 12 to 16 inches in length.

**BELCHER, SIR EDWARD** (1799-1877), a noted English naval officer. He was appointed in 1825 assistant surveyor to the expedition about to explore Bering Strait under Captain Beechey. He was made commander in 1829, and seven years later he was placed in charge of the *Sulphur*, bound for the western coasts of America and the Indies, on a tour of exploration. He returned within six years, during which time he had circumnavigated the globe, and rendered valuable aid in the Canton River to Lord Gough, whose successes over the Chinese were greatly due to Belcher's soundings and reconnaissances pushed into the interior.

**BELCHITE**, a town of Spain, in the province of Saragossa, about 22 miles from the city of that name, celebrated as the place, where, in 1809, the French under Suchet completely routed the Spanish under General Blake, capturing all their guns, with a loss of only forty men.

**BELED-EL-JERRED**, an extensive arid and sterile region lying east of Morocco, and stretching from Algeria on the north to the Sahara Desert on the south. It receives its name, meaning the "country of dates," from its one scanty production.

**BELEM**, a city of Brazil, on the right bank of the Para, the most southerly arm of the estuary of the Amazon.

**BELEMNITES** (Gr., *belemnion*, a dart or arrow), an interesting genus of fossil cephalopodous *Mollusca*, the type of a family called *Belemnitidae*, to the whole of which the name belemnites is very generally extended, and which are closely allied to the *Sepiidae* or cuttle family. See *Britannica*, Vol. XVI, p. 676. No recent species of this mollusk is known; fossil species, found in all the oolitic and cretaceous

ous strata, from the lowest lias to the upper chalk, are very numerous. These remains are generally those of the shell alone, an internal shell, entirely included within the body of the animal, like that of the cuttle. The most perfect specimens have a double shell, consisting of a conical chambered portion (the *phragmocone*) inserted into a longer solid, somewhat conical or tapering and pointed sheath.

BELEMNITIDÆ, a family of extinct cephalopodous mollusks, typified by the genus *Belemnites*. It includes also the genera *Belemnites*, *Belemnites* and *Niphotenthis*.

BELFAST, a city of Maine, county-seat of Waldo county, and a port of entry. It is beautifully situated on a hillside overlooking Belfast Bay, about 30 miles south of Bangor. The harbor is deep, wide, and safe. The principal industries are ship-building, fishing, and the manufacture of paper, shoes, and iron.

BELFRY (Fr., *beffroi*), a word of doubtful origin; a bell-tower, or turret, usually forming part of a church, but sometimes detached from it, as at Evesham and Berkeley, in England, and still more frequently in Italy. A belfry belonging to a church situated in a deep glen was built upon a neighboring height, as at Ardelach, Scotland, and at St. Feve and other places in Cornwall. At the close of the 17th century, it was a common thing in Scotland for the bell to be hung upon a tree, as at Aldbar, for instance. A belfry consisting of a mere turret, is called a *bell-gable*, or *bel-cote*, and always stands on the west end of the church. A smaller one is sometimes placed at the east end over the altar for the sanctus bell. After the 12th century, when the burghs began to gain influence, they asserted their right to have bells to call the burghers together for council or for action. Thus in the hearts of towns there arose municipal belfries.

BELGÆ, a name given by Caesar to the warlike tribes which in his time occupied one of the three divisions of Gaul. Their country was chiefly level, lying between the Rhine and the Seine, and comprised modern Belgium, part of the Netherlands, and northeastern France. They were in all probability, chiefly of Celtic origin. See *Britannica*, Vol. IX, p. 527; Vol. X, p. 111.

BELGARD, a Prussian town, almost entirely surrounded by water, in the province of Pomerania, at the junction of the Leitznitz and the Persante, about sixteen miles southwest of Cöslin. It has an old castle and the inhabitants manufacture cloth.

BELGIOJOSO, a town of Lombardy, North Italy, pleasantly situated in a fruitful plain between the Po and the Olona, nine miles east of Pavia. It has a noble castle, in which Francis I. spent the night previous to the disastrous battle of Pavia, in which he was made prisoner. Population, about 4,000.

BELGIOJOSO, CHRISTINA, PRINCESS OF (1808-1871), an Italian patriot who was twice exiled for taking an active part in revolutionary measures. In 1848 she equipped a cavalry force of 200 men at her own expense to assist in freeing Milan from the Austrian yoke. She was also a patroness of literature and art.

BELGOROD (Russian, *Beljgorod*, "White Town"), a town in the government of Koursk, Russia, situated on the Donetz. Three important fairs are held here yearly. Population, 15,200.

BELGRAVIA, the most aristocratic part of the West End of London, the English metropolis, extending from Hyde Park Corner to Piccadilly.

BELGIUM. Area, 11,373 square miles. Population (1888), 6,030,043; average population per square mile (1888), 530. Under its present constitution, adopted in 1830-31, Belgium is very properly classed as a limited monarchy. Capital, Brussels. For an elaborate article on the history, productions, and the changes in its constitution and for local map, see *Britannica*, Vol. II, pp. 514-31.

In 1830, a national congress proclaimed Belgium independent. Prince Leopold, of Saxe-Coburg, was chosen hereditary king, June 4, 1831. He died Dec. 10, 1865, and was succeeded by his son, Leopold II, who was born April 9, 1835. Under the reign of the latter remarkable prosperity has characterized the country. He will be especially remembered as the founder and patron of the Congo Free State, for his vigorous, most efficient support of Stanley's work in Central Africa, and for his influential efforts on behalf of the suppression of the African slave-trade. The king has been granted an annual civil list of \$660,000.

The king is the head of the executive power, but every official act must be countersigned by a responsible department minister, and the chambers are the sole interpreters of the constitution. The king's person is sacred; he transmits his power to his next male heir, and, in default of a male heir, he may nominate a successor, subject to the approval of the chambers. He may not suspend laws or dispense with their execution. He commands the land and sea forces, declares war, negotiates treaties of peace, alliance and commerce, which, however, must have the sanction of the chambers. The house of representatives is composed of one member for every 40,000 of the population, and the voters are those male citizens of not less than 25 years of age whose annual taxation is not less than 42 francs. The deputies not residing in Brussels are entitled to the pay of about \$84 per month while the chamber is in session. The senators, elected for eight years, number about half as many as the lower house, elected for four years; must be 40 years old and pay an annual tax of at least 1,000 florins. They are not entitled to any compensation for their services. In 1890 the senate numbered 69 members, and the representatives 136. For fuller notice, see *Britannica*, Vol. II.

The army, on a paid footing, in 1888 numbered 50,000 men with officers, under the colors, while the total force upon paper, available in emergency, was reported at 154,638. Exemption can no longer be obtained by purchase. Antwerp has the principal fortress. In 1888 the chambers voted \$1,920,000 for new forts on the Meuse, the new forts to be armed with guns placed in iron cupolas. Belgium has no navy proper, nor has it any colonies; but the king of the Belgians is, at the same time, "sovereign of the Free State of the Congo." In 1888 Brussels reported a population of 418,088; Antwerp, the chief port, 210,000, exclusive of suburbs; Ghent, 117,281, and Liege, 114,000.

The record of the Belgian royal family, as officially gazetted January 1, 1891, was as follows:

*Reigning King*.—Leopold II, born April 9, 1835, the son of King Leopold I, former Prince of Saxe-Coburg-Gotha, and of Princess Louise, daughter of the late King Louis Philippe of the French; ascended the throne at the death of his father, Dec. 10, 1865; married, Aug. 22, 1869, to Queen Marie Henriette; born Aug. 26, 1826; the daughter of the late Archduke Joseph of Austria.

*Children of the King*.—I. Princess Louise, born Feb. 18, 1858; married, Feb. 4, 1875, to Prince Philip of Saxe-Coburg-Gotha, born March 28, 1844; eldest son of Prince August, cousin of the reigning duke, and Princess Clementine of Orleans, daughter of the late King Louis Philippe of the French. II. Princess

Stéphanie, born May 21, 1864; married to the late Archduke Dédé Rudolf, only son of the Emperor of Austria and King of Hungary, May 10, 1881; widow 1889. III. Princess Clémentine, born July 30, 1872.

*Brother and Sister of the King.*—I. Philippe, Count of Flanders, born March 21, 1837; lieutenant-general in the service of Belgium; married April 26, 1867, to Princess Marie of Hohenloern-sigmaringen, born Nov. 17, 1845. Offspring of the union are four children: 1. Prince Baudouin, born June 3, 1869. 2. Princess Henriette, born Nov. 30, 1870. 3. Princess Josephine, born Oct. 18, 1872. 4. Prince Albert, born April 8, 1873. II. Princess Charlotte, born June 7, 1840; married July 27, 1857, to Archduke Maximilian of Austria, elected Emperor of Mexico July 10, 1863; widow June 19, 1867.

Since the above was gazetted, Prince Baudouin, nephew of the king and heir-apparent to the throne, died Jan. 23, 1891, very suddenly, aged 21 years. By his death his brother, Prince Albert, becomes heir-apparent to the Belgian throne.

Elementary education is compulsory, and is aided by a state grant of nearly \$5 per head, on the basis of attendance. The education grant in 1887 was \$2,060,100 for elementary education, and \$1,090,425 for secondary and higher education. There are four great universities—Ghent and Liege, controlled by the state, Brussels and Louvain, independent. Louvain has the "logical faculties."

French is the principal official language, but the Flemish has also been made an official language. The census of 1880 showed that about 45 per cent. of the people spoke French, 40 per cent. Flemish, and eight per cent. both French and Flemish. The prevailing religion is the Roman Catholic, but all religions are free under the constitution.

In 1889 the soil was divided among 1,169,406 proprietors; of the total area 58 per cent. was under cultivation. The exports to Great Britain alone in 1889 were valued at \$88,374,385. The public revenue in 1890 was \$83,149,100; public expenditure in 1890, \$80,173,120. The total public debt in 1890 was \$497,997,175.

The following table shows the respective commercial relations of the various nations with Belgium. The figures are compiled in francs, and are from the official Belgian returns of 1888:

| Imports from—       | Francs.     | Exports to—         | Francs.     |
|---------------------|-------------|---------------------|-------------|
| France .....        | 280,010,139 | France .....        | 342,680,888 |
| Netherlands. ....   | 216,115,703 | England .....       | 256,101,503 |
| Great Britain ..... | 182,557,286 | Germany .....       | 200,127,708 |
| Germany .....       | 168,943,432 | Netherlands .....   | 172,020,189 |
| United States ..... | 119,816,792 | United States ..... | 52,208,491  |
| Russia .....        | 119,783,457 | Italy .....         | 24,296,197  |
| Roumania .....      | 90,867,109  | Switzerland .....   | 22,686,432  |
| British India ..... | 55,215,890  | Argentine Rep. .... | 21,718,999  |
| Argentine Rep. .... | 51,798,639  | Spain .....         | 19,831,633  |
| Sweden-Norway ..... | 48,191,826  | Brazil .....        | 13,795,940  |
| Peru .....          | 32,204,977  | Portugal .....      | 12,011,904  |
| Brazil .....        | 24,533,811  | Turkey .....        | 9,299,896   |
| Italy .....         | 18,829,785  | Sweden-Norway ..... | 9,293,011   |
| Uruguay .....       | 15,218,859  | China .....         | 7,756,888   |
| Spain .....         | 10,976,538  | Russia .....        | 5,906,538   |
| Chile .....         | 8,415,851   | Roumania .....      | 5,627,860   |
|                     |             | British India ..... | 4,667,116   |

The latest official reports (those of 1886) announced 2,755 of railway, 1,984 being the property of the state, with a gross revenue of \$19,200,000; the telegraphs had a length of 3,893 miles; navigable rivers a length of 684, and the canals 560 miles.

BELGRADO, JAMES, an Italian Jesuit and a distinguished antiquary and mathematician, born at Udine in 1704, died in 1789. He wrote numerous works in Latin and Italian, mostly on scientific subjects.

BELIAL, a Hebrew word, signifying idle, wicked, or unprofitable. The Scripture phrase, therefore, "Sons of Belial," was originally, in all probability, a mere Hebrew figurative expression, denoting

worthless or dissolute persons. At a later period the idea of evil which the word embodies seems to have been elaborated into a personality, and Belial is supposed by some to correspond to the Pluto of the Greeks.

BELKNAP, GEORGE EUGENE, naval officer, born in Newport, N. H., Jan. 22, 1832. He was appointed midshipman from the State in 1847, and had passed the various grades up to commander in 1866. In 1862-64 he commanded the iron-clad *New Ironsides*, and his handling of this new kind of vessel was much praised by Admirals Dupont, Dahlgren and Porter. He was engaged in important service during the civil war, and commanded successively the *Seneca* and *Canonicus*, and after the war the *Hartford* and *Tuscarora*. On the last-mentioned steamer he engaged in deep-sea sounding, for the purpose of finding a route for a submarine cable between Japan and the United States. He was made commander in 1885.

BELKNAP, WILLIAM GOLDSMITH, soldier, born in Newburgh, N. Y., Sept. 7, 1794, died near Fort Wichita, Texas, Nov. 10, 1851. In the war of 1812 he was lieutenant, and advanced in rank till 1842, when, for services rendered in the Florida war, he was brevetted lieutenant-colonel. He established Fort Leavenworth, Kan., fought in the Rio Grande campaign, and for gallantry at Buena Vista was made brigadier-general. From 1848 to 1851 he commanded at Fort Gibson.

BELKNAP, WILLIAM NORTH, born at Newburgh, N. Y., Sept. 22, 1829, died Oct. 13, 1890. He graduated at Princeton, and practiced law at Keokuk, Iowa. He was a Democratic representative in the State legislature; went to the war and rose to the rank of major-general. From 1865 to 1869 he was internal revenue collector for his State, and in the last-mentioned year was chosen by President Grant as secretary of war. He held this office till 1876, when, being suspected of official corruption, he resigned. He was tried before the Senate, but acquitted on a legal technicality.

BELL, ALEXANDER GRAHAM, born at Edinburgh, Scotland, March 3, 1817. He was educated in the high school of his native city, then in the University of London, but was obliged to go to Canada for his health. In 1872 he came to reside in the United States, where he introduced his father's mode of instructing deaf mutes, and was made professor of vocal physiology in Boston University. Mr. Bell had for many years believed that sound could be communicated by electricity, and after a series of experiments, he invented and exhibited the first telephone in 1876. His invention has brought him great wealth and fame. He has also invented a photophone—a contrivance in which a beam of light is substituted for a wire in conveying sound. Mr. Bell is much interested in the education of deaf mutes, and at present is at work on an instrument for recording, which shall record speech by photographing the vibrations of a tiny stream of water. This inventor has his home in Washington, D. C.

BELL, ALEXANDER MELVILLE, born in Edinburgh, Scotland, March 1, 1819. His father, Alexander Bell, the inventor of a method for removing impediments of speech, was his teacher. He was an educator, and lectured at Edinburgh University, New College and University of London. On removing to Canada he was made instructor at Queen's College, Kingston. *Visible Speech*, a method of teaching deaf mutes, is his invention. He has written books on phonetics and elocution.

BELL, CURRIER. See BRONTÉ CHARLOTTE, *Britannica*, Vol. IV, p. 364.

BELL, SIR ISAAC LOWTHIAN, F. R. S., D. C. L., officer of the Legion of Honor, born in 1816. He was educated at Edinburgh and Paris. After being engaged in extensive chemical works, he and his brothers founded the great Clarence iron smelting works on the Tees. He was the member of Parliament for Hartlepool from 1875 till 1880, and was made a baronet in 1885. He has written many papers on metallurgical and chemical subjects.

BELL, JOHN, a statesman, born near Nashville, Tenn., Feb. 15, 1797, died at Cumberland Iron Works, Tenn., Sept. 10, 1869. He was a graduate of the institution formerly known as Cumberland College. He studied law and became State senator in 1814. In 1827 he was sent to Congress, where he remained for seven terms. He was a free trader, but became a protectionist and a founder of the whig party. He was chosen speaker of the House in 1834, and took part in several important debates from 1836 to 1838. President Harrison, in 1841, made him secretary of war, but he resigned when President Tyler left the whig party. Mr. Bell was sent to the United States Senate after having spent several years in retirement. He opposed the policy of annexation, opposed the Lecompton constitution for Kansas, and was the nominee on the "constitutional union" ticket for President in 1860. Secession was a movement condemned by Senator Bell, but he was not in favor of "coercion."

BELL, JOHN, a sculptor, born in Norfolk, England, in 1811. The work by which he is best known in this country is his allegorical representation of the *United States Directing the Progress of the New World*, a copy of which, in terra-cotta, was sent to the Centennial Exhibition at Philadelphia, and afterwards to Washington. His *Andromeda Bound to the Rock* is the property of Queen Victoria. He has published a number of literary works, chiefly on sculpture and the allied arts.

BELL, THOMAS, born in England in 1792, died 1880; an eminent naturalist. He studied medicine at London, from 1814 to 1815, and in 1836 he was made professor of zoology at King's College in that city. In 1844 he became first president of the Ray Society.

BELL OF A CAPITAL, also called BASKET, the capital of a pillar denuded of the foliage, in which case it resembles the form of a bell reversed.

BELLA, a thriving town of Naples, in the province of Basilicata. Population, 6,000.

BELLADONNA LILY, a very beautiful species of amaryllis, with rose-colored drooping flowers clustered at the summit of the leafless flowering stem. It is a native of the Cape of Good Hope and of the West Indies; it has become naturalized in Madeira. The flowering stem is about 18 inches high.

BELLAGGIO, an Italian village situated on the promontory that separates the two arms of Lake Como. Its hotels are among the finest in Italy, and some of its lovely villas contain valuable art collections. Population, 966.

BELLAIRE, a commercial and manufacturing city of Ohio, situated on the Ohio River, about five miles below Wheeling. It contains important manufactures of glass, tinware, and flour, besides machine-shops, foundries and nail-works; and abundance of iron, coal, limestone and fire-clay are found in the vicinity.

BELLAMY, EDWARD, author, born in 1850 at Chicopee Falls, Mass. He was educated at Union College, studied in Germany for a year, and, on his return to America, he studied law and then turned his attention to journalism. During 1871-72 he was successively on the staff of the New York "Evening

Post" and of the "Springfield Union." He has written *A Nantucket Idyl*, *Miss Ludington's Sister*, *The Blind Man's World* and *Looking Backward*. The last mentioned is a very popular book.

BELLAMY, JOSEPH, a clergyman and educator, born at Cheshire, Conn., in 1719, died at Bethlehem, Conn., March 6, 1790. He graduated at Yale, and at the age of eighteen was licensed to preach. He spent his life preaching at Bethlehem, where, about 1742, he established a divinity school, which was most successful and was attended by many eminent men. Some of Dr. Bellamy's works are *True Religion Delivered*, *The Nature and Glory of the Gospel*, and *The Law Our Schoolmaster*.

BELL-BIRD, a bird of a genus nearly allied to the cotingas, but characterized by a very broad bill, soft and flexible at the base and hard toward the extremity. It is about the size of a jay; the male is of snow-white plumage. It is found in South America, and is remarkable for the metallic resonance of its cry, which resembles the tolling of a bell. It generally takes its place at the top of a lofty tree, and the tolling can be heard at the distance of three miles. It resounds through the forest not only in the morning and evening but also at mid-day, when the heat of the blazing sun has imposed silence on almost every other creature. See *Britannica*, Vol. XII, p. 139, and Vol. XXIV, p. 139.

BELL-BIRD.

BELL, BOOK AND CANDLE. The excommunication by Bell, Book and Candle is a solemnity belonging to the Church of Rome. Two or three sentences from the conclusion of the form of excommunication in the Scottish Church previous to the Reformation explain its symbolism: "Cursed be they from the crown of the head to the sole of the foot. Out be they taken from the book of life. (Shuts the book.) And as this candle is cast from the sight of men, so be their souls cast from the sight of God into the deepest pit of hell. (Casts the candle on the ground.) Amen." The rubric adds: "And then, the candle being dashed on the ground and quenched, let the bell be rung"—the bell being tolled as for the dead.

BELLE-ALLIANCE, the name of a farm in the province of Brabant, Belgium, 13 miles south of Brussels. It has become famous as the position occupied by the center of the French army in the battle of Waterloo, 1815.

BELLE-DE-NUIT, a name given to a certain tropical species of *Convolvulaceæ*, with extremely beautiful and fragrant flowers, which open only during the night. The species to which perhaps the name more particularly belongs, is *Ipomœa Bona Nox*, the Moon Flower, or Evening Primrose, a native of the forests of the West Indies and of tropical America.

BELLEFONTAINE, a beautiful manufacturing town of Ohio, county-seat of Logan county, noted for its healthfulness, and as having the highest elevation of any town in the State. The manufactures are chiefly woollens, carriages and railroad cars.

BELLEFONTE, a town of Pennsylvania, county-seat of Centre county, beautifully situated on Spring Creek, at the foot of Bald Eagle Mountain. It contains important manufactories of railroad cars, glass, axes, printing presses and other machinery, and a number of foundries, furnaces and rolling mills. It stands in the midst of charming scenery, and contains a large spring of the purest water, from which it derives its name.

**BELLEGARDE**, a hill fortress of France. Situated on the Spanish confines, on the road from Perpignan to Figueras, and in the pass between Col-de-Portus on the east and Col-de-Panizas on the west; it has belonged alternately to each nation. Here the French under Philip III were defeated by Peter III of Arragon in 1285. In the fourteenth century it consisted only of a fortified tower, captured by the Spaniards in 1674, and again by the French in 1675. In 1793 it was blockaded and taken by the Spaniards, but was retaken by the French in the following year.

**BELLE ISLE**, an island in the Atlantic, about midway between Newfoundland and Labrador, is chiefly known as giving name to the adjacent strait on the southwest, which forms the most northerly of the three channels between the Gulf of St. Lawrence and the open ocean.

**BELLISLE**, **CHARLES LOUIS AUGUSTE FOUQUET**, Duc DE, marshal of France, born at Villefranche, in Aveyron, Sept. 22, 1684, died Jan. 26, 1761. He early distinguished himself in the wars in Italy and the Low Countries against Spain, and afterwards in Poland. In the war of the Austrian succession he stormed Prague in 1741 and in the following year conducted the marvelously skillful retreat to Eger. In 1757 he was made war minister, and as such introduced important improvements in the French service. See *Britannica*, Vol. IX, p. 586.

**BELLEVUE**, a mining town of Idaho, situated in the northern part of Alturas county, between the Wood and Little Wood Rivers. It is the business center of an important mining region, and of the farming and stock-raising industries of the vicinity.

**BELLE PLAINE**, a village of Iowa, about thirty-five miles west of Cedar Rapids, and two miles north of the Iowa River. It contains railroad machine-shops, manufactories of flour and gloves, and is an important center of transportation for grain.

**BELLEROPHON**, a genus of extinct gasteropodous mollusks, represented by a great number of species occurring in the Silurian, Devonian and Carboniferous rocks in many parts of the world.

**BELLES-LETTRES**, a term adopted from the French, and generally used in a vague way to designate the more refined department of literature, but has in fact no precise limits. In English usage it is synonymous with another vague expression, *polite literature*, including history, poetry, and the drama, fiction, essay and criticism.

**BELLEVILLE**, a town of France, in the department of the Seine, forming a suburb of Paris, and inclosed by the new fortifications. It has manufactories of cashmeres, varnished leather, articles of polished steel, chemical stuffs, etc. There are springs at Belleville which have supplied Paris with water from a very early date, and it has tea-gardens and other places of amusement much resorted to by the Parisians. It has been a center of communistic agitation. Population, 75,000.

**BELLEVILLE**, a prosperous city of Illinois, and capital of St. Clair county, built on elevated ground; is on the St. Louis and Southeastern, the St. Louis, the Belleville and Southern and the Illinois and St. Louis Railroads. The distance from St. Louis is fifteen miles, from Springfield, the State capital, 110 miles. A branch road also runs to O'Fallon in the same county. Here are eight or ten churches, a convent, good schools, one national bank and one savings bank, two daily German papers and two weekly English papers. Here are several breweries, and large manufactories of various kinds, such as of iron, nails, flour, thrashing machines, steam engines, pumps, drills, etc. Here also are valuable

and easily-worked mines of bituminous coal. Population in 1880 was 10,683; in 1890, 15,360.

**BELLEVILLE**, a city of Kansas, county-seat of Republic county, is the center of a rich agricultural and mining district, and the seat of a college.

**BELLEVILLE**, a thriving town in the province of Ontario, Canada, situated on the Bay of Quinte, Lake Ontario, forty-eight miles west of Kingston by rail. It is the seat of Albert University, founded in 1857. Population, 9,516.

**BELLEVUE**, a beautiful town of Iowa, located on a high bank of the Mississippi, about twenty-five miles below Dubuque. It is a fashionable summer resort, and an important center of transportation, by rail and water, for grain, stock and produce.

**BELLEVUE**, a manufacturing town of Michigan, about twelve miles northeast of Battle Creek. It contains important manufactories of lumber, flour and iron, and produces excellent lime.

**BELLEVUE**, a village of Nebraska, county-seat of Sarpy county, on the Missouri, fifteen miles below Omaha. It contains an excellent high school and a manufactory of bee-hives.

**BELLEVUE**, a manufacturing town of Ohio, forty-five miles southeast of Toledo. It contains a number of foundries and machine-shops, and manufactories of carriages, plows and barrels, and is an important grain market.

**BELLINGHAM BAY**, a village of Washington, on the bay of the Pacific of the same name. It produces large quantities of lignitic bituminous coal, considered the best on the Pacific coast.

**BELLINGHAM**, **RICHARD**, born in England, 1592, died, Dec. 7, 1672. He came to Boston in 1634, was one of the original patentees of the colony, and after being deputy-governor, in 1641 was elected governor, again in 1654, and from 1665 up to his death he held that office; being deputy-governor thirteen years and governor ten years. In 1664 he was chosen major-general. Bellingham was an obstinate man, but one who commanded respect. He was intolerant with regard to religious sects which differed from his own.

**BELL METAL**, a sonorous alloy used in making bells. The principal ingredient is copper; the alloy, being generally twenty to twenty-five per cent. of tin, zinc or other metal, is sometimes used, however, with the copper.

**BELLOMONT**, or **BELLAMONT**, **RICHARD COOTE**, earl of, the eldest son of Baron Coote of the Irish peerage, born in 1636, died at New York, March 5, 1701, and was buried at the Battery. He now lies in St. Paul's churchyard on Broadway. In England the subject of this sketch held several prominent offices. He was member of Parliament in 1688, and treasurer and receiver general, several years later, to Queen Mary. Being appointed governor of New York and Massachusetts in 1795, he started for the former place, and during his stay became extremely unpopular. He went to Massachusetts in 1699, where he was received cordially. The king had sent him out with the primary object of suppressing piracy, and the governor, with the king's consent, equipped a ship of his own and sent Captain William Kidd to clear the surrounding waters of pirates. Kidd turned pirate, and the governor was even suspected of complicity. Bellomont evinced his honesty by going to New York and waging a ruthless war on illegal traders. This made him unpopular, and petitions were sent to England for his recall. These troubles hastened his death.

**BELLOT STRAIT** is the passage connecting Prince Regent Inlet with Peel Strait or Sound, and separating North Somerset from Boothia Felix. Kennedy, in his search for Franklin, discovered its

eastern entrance, and named the strait after his lamented companion, Bellot. See *Britannica*, Vol. III, p. 549. After four fruitless attempts to explore it, the achievement was accomplished by McClintock; it is about 20 miles long, and at its narrowest part about one mile wide, running between granite shores rising from 1,500 to 1,600 feet. The winds and the waters have full sway here, the water flowing from the west in permanent currents and flood tides.

**BELLOWS FALLS**, a manufacturing village in Windham county, Vermont. It is situated on the Connecticut river, which here has a fall of forty-foot in half a mile and furnishes water power for the manufacture of paper, farming-implements, and woolen goods.

**BELLOWS FISH**, a local name for several species of fishes; particularly in Rhode Island, or the angler-fish; and, in Europe, for the trumpet-fish of the Mediterranean and Atlantic coasts.

TRUMPET-FISH.

**BELLOWS, HENRY WHITNEY**, an eminent Unitarian clergyman, born at Boston, Mass., June 11, 1814, died in New York

city, Jan. 30, 1882. He graduated at Harvard and afterwards at the Cambridge divinity school. He was ordained pastor at the Congregational Church in New York, and here he remained for forty-three years. He was editorially connected with the "Christian Inquirer," "Christian Examiner" and the "Liberal Christian." Several notable addresses were made by him on public occasions. He was president of the U. S. Sanitary Commission, holding office from 1861 to 1878—during which time \$15,000,000 in supplies and \$5,000,000 in money were distributed according to his directions.

**BELLOU, PIERRE LAURENT BUIRETTE**, born in Saint-Flour, Auvergne, in 1727, died in 1775. He was one of the first French dramatists who ventured to introduce on the stage native instead of Greek or Roman heroes.

**BELL ROCK**, or **INCHECAPE**, an old red sandstone reef in the German Ocean, twelve miles southeast of Arbroath, and almost opposite the mouth of the Tay. It is 2,000 feet long, and at spring-tides part of it is uncovered to the height of four feet, the sea being only three fathoms deep for one hundred yards around. It caused at one time a great deal of shipwreck, and tradition states that the abbot of Aberbrothwick (Arbroath) placed a bell on it, "fixed upon a tree or timber, which rang continually, giving notice to the sailors of the danger."

**BELLS**. For general article on BELLS, see *Britannica*, Vol. III, pp. 536-39. American bells are now found in all quarters of the globe. The special aim of bell-founders in the United States is to produce the greatest volume and prolongation of tone, combined with the best quality of sound and the highest traveling character from the least weight of metal, and these results have attained to such an extent as to secure to the trade a greatly extended and rapidly increasing patronage. American manufacturers may be congratulated upon the generally acknowledged fact that their bells are uniformly designed and cast with superior excellence in all these respects. As the musical qualities, purity and beauty of tone and power, that distinguish the best bells from those of an inferior class depend largely on the purity of the material used, the greatest care is taken as to the selections made. The following is quoted from the circular sent out in 1891 by one of the oldest and leading American firms:\*

"1. We guarantee that all the copper melted and used in the manufacture of the bell or bells will be the purest new ingot copper that can be obtained, said copper being guaranteed to us to be the purest manufactured.

"2. We guarantee that, with each seventy-seven pounds of said copper, we will melt and mix not less than twenty-three pounds of best new imported block tin.

"3. We guarantee that an analysis of the bell or bells will show that the bell metal is composed of the best of copper and tin only, and that it is not in any manner debased by the addition of any cheap metal or metals.

"4. We further guarantee that no cheap, impure or brittle ingot copper, and that no old copper, with its accumulations of solder and dirt, will be used in the manufacture of the bell or bells."

"Sets of bells, of all kinds, in foreign countries are usually called *peals*; in America the term is applied to those which are attuned to harmonic intervals, while those which are attuned to diatonic intervals are called *chimes*. Thus, a set of bells upon the

eight notes of the music scale is a chime, a set upon the first, third, fifth and eighth is a *peal*:

"The smallest number of bells that may be said to compose a chime is five, while what might be called the natural number—corresponding to the notes of the natural scale—is eight; but as the addition of an extra bell giving the note of the flat seventh creates a new series of diatonic tones in the key of the fourth, thus allowing music of two different keys to be played, this bell is usually added to the octave, so that a full chime is now understood to consist of at least nine bells, which number may, of course, be increased by adding bells which produce other tones, either within or beyond the octave.

"The best manner of mounting chimes is to provide the largest bell of the set with the usual fixtures, so that it may be rung as an ordinary church-bell, and to suspend the others stationarily from trusses in such positions as the capacity of the tower may require; the general plan of mounting, as also the arrangement of the chiming apparatus, being shown in the illustration. Should the bell room be limited in width, but have a fair height, the bells are placed in sections above each other, the position being a matter of indifference, provided the windows are of sufficient height to give egress to the sound.

"Chime-ringing levers enable the ringer to perform any music within the range of the bells the same as upon a musical instrument, the elasticity of touch and effect of the blow being greatly enhanced by our recently improved mode of connecting the levers with the clapper, by means of which the same facility of execution is secured as upon the pedals of an organ. It should be stated, both for the information of purchasers and in commendation of this mode of chime-ringing, that it de-

\*That of Meneely & Co., West Troy, N. Y., to whom we are indebted for special favors in the preparation of this article.

not require the services of a professional musician, but may be performed acceptably, and with comparatively little practice, by almost any person having an ear for music."

As it is impracticable to play tunes upon peals (as distinguished from chimes), they are usually so mounted that each bell may be swung, thus allowing different bells to be rung for different church services, if desired, while their being rung together, either successively or simultaneously, produces a pleasing effect. A peal being usually considered as the nucleus of the future chime, the careful manufacturer bears this in mind in determining the weights and tones of the bells selected for peals, and retains a record of the key of the tenor bell as a needed help in selecting additional bells to complete the possible future chime.

As to the inquiry often made, how far a bell of given weight may be heard, it is impossible to give any satisfactory information. At least one-half depends upon the formation of the land surrounding the structure in which the bell is hung. Lengthwise of a valley the sound will often go more than twice as far as it does over an adjoining hill. So also it may be heard much farther over water than over a plain. So also the more open the space in which the bell is hung the freer will the sound be to reach long distances. In all cases the usual acoustic laws govern the "reaches" of the "ringing-bell." A small bell outside, or in a partially con-

finied room in a tower, may be heard twice or even several times as far as one shut in by obstructions of walls or partially open window-blinds. Referring to this question, a well-informed and well-known critic on towers says:

"Nine out of ten modern towers are built as if the architect supposed it was the bell founder's business not only to cast the bells but hang them, make the towers large enough to hold them, and to invent some way or other of making the sound find its way out of the windows wherever they are and however small they may be. Oddly enough, too, almost as I am writing this, I have received a letter from a London bell-ringer of twenty-six years' standing, complaining that, of all the churches built there within the last thirty years, there are only two which are properly adapted to the bells which they contain; the main faults being that the bell chambers are too low, and the windows so small that not half the sound of the bells can get out. In a tower which is nothing more than a base for a spire the bells have to bang so low that they are hardly above the roofs of the surrounding houses, and so are disagreeably noisy at a little distance and yet hardly to be heard a great way off, whereas, good bells properly placed always sound the best at a distance; and when they are clear of all these defects in the tower the architect or builder generally contrives to bottle up the sound as much as possible by filling the bell chamber windows with close louvers deeply overlapping each other, so that even the sound that does get out is, as it were, shot down onto the roof of the church instead of being allowed to spread freely. Mr. Ruskin also abuses close louvers on architectural grounds, and notices the grand effect of the large, wide ones in many foreign churches."

The largest bell made in the United States weighed 22,000 lbs., and before it was fractured hung in the City Hall, New York. On some occasions it was heard thirteen miles up the Hudson River; but that date was before the upper part of Manhattan Island was covered with structures varying from four to twenty stories in height. The largest bell in Canada is that of Notre Dame Cathedral, Montreal, weighing 29,400 lbs. The reference catalogues of American dealers would present extended lists showing a great number of large bells throughout the country ranging in weight from 8,000 lbs. to 17,000 lbs. As a list of the largest bells of the Old World is given in detail in Vol. III, it is omitted in these Additions and Revisions; but the reader will be gratified to find here

THE GREAT BELL OF MOSCOW.

a correct illustration of the bell of Moscow, the greatest ever constructed, whose weight was such that it was never hung.

The bell bears an inscription stating that the first great bell was cast in 1553, and weighed 36,000 pounds; during the reign of the Tsar Alexis it was ruined by fire, and in 1654, with additional metal, was recast into the second great bell, the weight of which was 288,000 pounds; that this second bell was in 1706 also destroyed by fire, and in 1733, with still more metal, was recast by order of the Empress Anne, into the present great bell, which measures 22 feet, 8 inches across the mouth, 19 feet, 3 inches in height, and weighs (estimated) about 440,000 pounds.\* It seems to have been cracked in cooling; a nearly triangular-shaped piece of about 6 feet in height and 7 feet at the base, and weighing about 11 tons, was broken out at the rim and now stands on the ground just below the opening thus formed. When the great bell was placed in its present position it was intended for service as a chapel, and for that purpose an opening was left through the pedestal wall which, with the opening in the bell above it, forms an imposing entrance.

To the list in *Britannica*, Vol. III, page 539, should be added the new bell of St. Paul's in London, commonly known as the "Great Paul." It was raised to its place May 31, 1882, and dedicated with imposing ceremonies three days later. It is 8 feet 10 inches in height, and 9 feet 6 $\frac{3}{4}$  inches in diameter, and weighs 17 $\frac{1}{2}$  tons. Its note is E flat; materials, copper and tin; and its cost about \$15,000.

BELLS, on shipboard, is a term having a peculiar meaning nearly equivalent to that of "time" or "o'clock" in ordinary land life. The time is divided into watches of four hours each, ending at 4, at 8 and at 12, and the stroke of a bell marks each half-hour. These strokes have no reference to the hour, but simply designate the number of half-hours that have passed in that particular watch. Thus, "three bells" is a phrase denoting that three half-hours have elapsed, but it does not in itself show to what watch it refers.

BELLUNO, a city of Venetia, Northern Italy, on the right bank of the Piave, and 51 miles north of the city of Venice. It is walled, is the seat of a bishop, has a handsome cathedral, hospital, public library, fine aqueduct, etc. It has a trade in timber, and manufactories of silks, hats, leather and earthenware. Population, 10,000.

BELMONT, a village of Missouri, on the Mississippi River, opposite Columbus, Ky., noted as the site of a severe battle fought Nov. 7, 1861, in which the Confederate works were stormed and taken by the Federal troops under General Grant, and retaken by the Confederate forces under Major-General Polk.

BELMONT, a village of New York, situated on the Genesee River, about midway between Dunkirk and Elmira. It is extensively engaged in the manufacture of barrels.

BELMONT, Auerst, financier, born at Alzey, Germany, in 1816, died in New York city, Nov. 24, 1890. He was educated in Frankfort, entered the employ of the Rothschilds in 1830, and came to New York in 1837, where he settled as their agent. He soon began to prosper and at the age of forty was a millionaire. His office was on Wall street, but he was a banker, never a gambler in stocks. In 1844 Mr. Belmont was appointed consul-general by the Austrian government, and this office he held six years. He was a Democrat, was sent by President

Pierce as minister to the Hague, and from 1860 to 1872 was chairman of the national Democratic convention. He was of the opinion that the Southern States should be allowed to secede, thinking they would soon be glad to come back into the Union. The event of war proved Mr. Belmont in error, and caused him to change his views and advocate the prosecution of the war. He had such an influence abroad that he prevented the confederacy from obtaining credit in the foreign money market. While visiting Europe he was able to help the Union cause and furnished valuable information to Secretary Seward. Mr. Belmont was a lover of art, and made quite a collection of paintings. For years he was noted as a breeder of fine horses.

BELOIT, Kansas, a city and important business center, the county-seat of Mitchell county. The Solomon River furnishes excellent water power. White magnesian limestone, a good building stone, is here quarried.

BELOIT, a city of Wisconsin, situated on both sides of Rock River, immediately north of the boundary line of Illinois. It is the seat of Beloit College, the center of an extensive farming and dairying district, and the headquarters of important manufactures, including paper, reaping and mowing machines, water-wheels, plows and machinery.

BELMANCY, a mode of divination by arrows, practiced among the Arabs and other nations of the East. A number of arrows being shot off with sentences written on labels attached to them, an indication of futurity is sought from the inscription on the first arrow found. This is only one of many ways of divining by arrows.

BELON, PIERRE (1517-64), a celebrated French naturalist, born in 1517, at Soulethière. He studied medicine at Paris, and traveled through Germany. Afterwards he visited Greece, Asia Minor, Egypt and Arabia. He returned in 1549 and published the results of his travels in a work entitled, *Observations on Several Singular and Memorable Things Discovered in Greece, Asia, Judea, Egypt, Arabia and Other Foreign Countries*. Charles IX gave him apartments in the Château of Madrid, a sumptuous edifice in the Bois de Boulogne, constructed by Francis I. Here he resided till his tragic death in 1564; he was killed by robbers while gathering herbs in the Bois de Boulogne. In 1551 he published, among other things, an exact description of the dolphin, and the earliest picture of a hippopotamus. He published the most important treatise on ornithology of the 16th century.

BELPER, an English market town, in Derby county, on the Derwent. It contains the remains of the mansion which was at one time the dwelling place of John of Gaunt.

BELTON, the county-seat of Bell county, Texas, on Leon River. It has a Masonic institute, the Chamberlain Institute, and Baylor Female College, the oldest in the State. Its educational institutions are excellent and numerous.

BELUGRA, or WHITE WHALE (*Delphinapterus leucas*), a cetacean mammal allied to the dolphins. Its form, which is remarkably characterized by the softness of all its curves, adapts it for rapid and graceful movements. See *Britannica*, Vol. XV, p. 398; Vol. XXIV, p. 525.

BELUR, a village of Mysore, situated 130 miles west of Bangalore. It is known in the Puranas as *Talapura*, and locally regarded as the Southern Benares. It is the site of a celebrated temple. Population, 3,000.

BELVEDERE, originally an erection on the top of a house for the purpose of looking out on the surrounding country and enjoying the air, in which

\*This weight is just double that of the largest bell now in use in the world; viz. that suspended above the chapel of St. Nicholas, in the Kremlin in Moscow, weighing 230,000 pounds. This was cast in 1817. It is said that the sound, when the bell is rung, which is only once a year, is "a deep, hollow murmur, vibrating all over Moscow like the rolling of distant thunder."

sense it is still understood in Italy. A part of the Vatican in Rome is known as the Belvedere, and gives name to the famous statue of Apollo. In France the word has come to signify any kind of summer-house or place of refreshment.

BELVEDERE, an annual plant of the natural order *Chenopodiaceæ*, a native of the Middle and South of Europe and of Asia, familiar in gardens as an ornamental annual, not on account of its flowers, which have no beauty, but of its close, pyramidal, rigid form, and numerous narrow leaves, which make it appear like a miniature cypress tree. It is sometimes called Summer Cypress.

BELVIDERE, an educational and manufacturing town of Illinois, on the Kishwaukee River and Chicago and Northwestern Railroad; it is the county-seat of Boone county.

BELVIDERE, the capital of Warren county, N. J., a flourishing town on the Delaware River and Pequest Creek. There is a bridge here across the Delaware. Abundant water power is furnished for cotton and flour mills and a carriage factory. The Pennsylvania Railroad passes through the town. The surrounding region furnishes iron ore, limestone, slate and magnesia.

BELVISIA (also called *Napolona*), a genus of exogenous plants, the type of the order *Belvisiaceæ*, of which order only a few species, natives of tropical Africa, have yet been discovered. They are large shrubs, with smooth, simple, leathery leaves, the beautiful and very curious flowers, growing in threes, being sessile in the axils of the leaves. The calyx is a thick leathery cup, divided into five ovate segments. The corolla is composed of three distinct rings, the outer one five-lobed, and furnished with ribs, by means of which it is strongly plaited, turning back and hiding the calyx when full blown; the second, a narrow membrane, divided into numerous regular segments like a fringe; the third, an erect cup-shaped membrane. The erect stamens resemble another cup. The ovary is five-celled, each cell containing two ovules; the short, thick style is five-angled, with a broad, flat stigma of as many angles. The fruit is a soft berry, crowned with the calyx, with large kidney-shaped seeds.

BEM, JOSEPH (1795-1850), commander of the army in Transylvania during the Hungarian revolution, born at Tarnov, in Galicia, in 1795. After a course of military adventure in Poland he went to France, where he resided for a considerable time. In 1848 he joined the Hungarians and was intrusted with the command of the army of Transylvania. He defeated the Austrian army and succeeded in driving their allies, the Russians, back to Wallachia. Having thus made himself master of Transylvania, at Kossuth's request he hastened into Hungary, where he took part in the unfortunate battle near Temesvar. He made his escape into Turkey, where he embraced, from political motives, the profession of Islam; he was raised to the dignity of a pasha and obtained a command in the Turkish army. In 1850 he was sent to Aleppo, where, after suppressing the sanguinary insurrection of the Arabs against the Christian population, he died of fever, Dec. 10, 1850. He was in private life characterized by his benevolent disposition, and as a military leader distinguished by courage, presence of mind in extreme danger, and remarkable rapidity of movement.

BEMBATOOKA, BAY or, a safe and commodious bay on the northwest coast of Madagascar. Prime bullocks are sold here, and bought extensively by agents of the French government, who have them driven to Fort Dauphin on Antongil Bay, on the opposite side of the island, where they are killed and cured for the use of the French navy, and for

colonial consumption. Rice is also sold very cheap at Bembatooka. Majunga, on the north side of the bay, is an important town, Bembatooka being only a village.

BEMBECIDÆ, a family of hymenopterous insects of the division in which the females are furnished with stings. Along with *Sphegide*, and other nearly allied families, they receive the popular name of sand-wasp. They very much resemble bees or wasps in general appearance; they are natives of the warmer parts of the world. Some of them are remarkable for the odor of roses which they emit. The females make burrows in sandy banks, in each of which they deposit an egg, and along with it bodies of flies as food for the larva.

BEMBRIDGE BEDS, a division of the Upper Eocene strata, resting on the St. Helen's, and capped by the Hempstead series, the maximum thickness being 115 feet. Here have been found remains of the *Anoplotherium*.

BEMIS HEIGHTS, or BEMUS HEIGHTS, a small village of New York, in Saratoga county, famous for having been the place where occurred the first battle of Stillwater, Sept. 19, 1777. Generals Gates and Burgoyne were the opposing commanders.

BEN, a Hebrew word signifying "son," and forming the first syllable of many names, ancient and modern, as Benhadad, Benjamin, &c. The corresponding Arabic word *Ibn*, or *Ebn*, in like manner enters into composition of a great number of names, as Ibn Sina, Ibn-al-Faradhi, &c. Ibn in some of its constructive forms, drops the initial vowel, thus nearly corresponding to the Hebrew, as *Jusuf-ben-Yakub* (Joseph, the son of Jacob).

BEN, a term of Gaelic origin, prefixed to the names of the principal mountains of Scotland, as Ben Ledi, Ben Lomond, &c. It is essentially the same as the Welsh *Pen*, the primary signification of which is "head," and hence it may be considered as equivalent to "mountain head." The term *Pennine*, applied to a division of the Alps, is doubtless derived from the Celtic *Pen* or *Ben*, and even the name Apennines is in all probability from the same root.

BEN, OIL or, a fluid fixed oil, obtained from the seeds of a tree found in India and Arabia, and known as the horse-radish tree. The seeds are called Ben-nuts, and are roundish, with three membranous wings. The oil is used by watchmakers, because it does not readily freeze; also by perfumers, as the basis of various scents, and other oils are often adulterated with it.

BENATEK, a small town of Bohemia, on the right bank of the Lser, a few miles distant from Prague. It is worthy of note as being for a time the residence of the celebrated astronomer Tycho Brahe.

BENBECULA, one of the Hebrides or Western Isles of Scotland, between North and South Nith, 20 miles west of Skye, and belonging to Invernesshire. It is eight miles long, and eight miles broad, low and flat, and consists chiefly of bog, sand and lake, resting on a substratum of gneiss rock, with a very broken coast-line. Population, 1,700, consisting of fishermen and farmers, who fertilize the soil with the seaweed which is cast ashore on the island.

BENCH-WARRANT, a process issued by a judge or court against a person guilty of some contempt, or indicted for some crime.

BEND, the name for one among the many kinds of knot by which ropes are fastened on shipboard. Seamen imply this meaning when they speak of "bending the cable," the "fishermen's bend," the "sheet bend," &c.

BENDA, GEORGE, the most distinguished of a notable musical family, born at Junghunzlau, in

Bohemia, in 1721, died at Kostritz in 1795. He excelled as a pianist, violinist, and composer, and was bandmaster to the Duke of Gotha (1748-87), and in this period produced several operas and cantatas, such as *Ariadne auf Naxos* and *Medea*.

BENDEMANN, EDWARD, a celebrated painter of the Düsseldorf school, born at Berlin in 1811. He received a careful scientific education, but devoted himself to art, became a pupil of Schadow's and soon proved that he was not mistaken in his vocation. When he was but 20 years of age, his picture of the *Captive Jews* was exhibited at Berlin, and at once acknowledged to be a masterpiece. His next important work in 1833 represented *Two Girls at a Fountain*, followed in 1837 by *Jeremiah at the Ruins of Jerusalem*, a picture for which he obtained a prize-medal at Paris. His pictures are distinguished by a grace and charm arising from symmetry in drawing and composition, *nuveté* in conception, and a tender, harmonious, yet always truthful coloring. He was director of Düsseldorf Academy from 1859 to 1867.

BENDIGO, one of the most productive gold-fields in the colony of Victoria. It is about 25 miles to the north of Mount Alexander, which again is about 75 miles inland from Melbourne.

BENE, a town in the province of Mondovì, Piedmont, 18 miles from Coni. It occupies the site of the ancient *Augusta Bagiennorum* destroyed by Alaric. Many interesting vestiges are found in the neighborhood, and the ruins of an aqueduct, baths, and amphitheater are still visible. Population, 6,000.

BENEDEK, LUDWIG VON, an Austrian general, born at Odenburg, Hungary, in 1801, died at Gratz in 1881. He received a military education, entered the army as ensign in 1822, and became distinguished for gallantry and skill. He was governor of Hungary in 1860, and in 1866 was made commander-in-chief of the Austrian army. After the defeat at Sadowa he was brought before a court-martial, and although the proceedings were quashed by the emperor, Benedek never recovered from the savage criticisms of his mortified and defeated countrymen. See *Britannica*, Vol. III, p. 140.

BENEDETTI, VINCENT, a French diplomatist who held various important positions. When ambassador to Prussia, he urged offensively upon the king, in the public walks at Ems, in 1870, a measure distasteful to his majesty, through which he was denied all further interviews. Each government then claimed that it had been grievously insulted by the other, and when Benedetti returned to Paris, France declared war upon Prussia with a disastrous result to herself. See *Britannica*, Vol. IX, p. 626.

BENEDICTE, a hymn or song of the three children in the fiery furnace, sung in the Christian Church as early as the time of St. Chrysostom, and used in the Anglican Church in the morning service when the *Te Deum* is not sung.

BENEDICT, SIR JULIUS, born in Germany 1801, died in 1885. He was a musician and composer. In 1836 he took up his residence in England. He was musical director of the Kärntner Thor Theater, Vienna, in 1824; and, later on, occupied the same position at Naples. In Paris, and afterward in London, in 1835, he appeared with great success as a pianist. In 1850 he conducted at Jenny Lind's concerts in America.

BENEDICT, Bishop, an ecclesiastic, born in England in 629. His influence upon Anglo-Saxon civilization and learning was most important. Until about the year 651 he served at the court of Oswin, king of Northumberland, after which he spent about ten years at Rome in study. In 665 he

returned to Rome on a mission for Alchfrid, king of Northumbria, and was made abbot of the monastery of St. Peter, at Canterbury, after his return to England (668). He purchased a valuable collection of books about five years later, and went to Northumbria, where he founded the famous monastery of Wearmouth on a piece of land near the mouth of the Wear, presented to him by King Ecgfrid. See *Britannica*, Vol. III, p. 481.

BENEDICTINES. See *Britannica*, Vol. III, p. 558, and Vol. XVI, pp. 704, *et seq.* An account of the Benedictines, as affecting the history of England, is given in Vol. VIII, pp. 372, *et seq.* Their historical monasteries are described in the article ABBEY, and their libraries in Vol. XIV, p. 513. The Benedictines in the United States are known as the American Cistercian Congregation. The parent organization is the house at Latrobe, Pa., founded in 1846 as the Monastery of St. Vincent, and raised in 1855 to the dignity of Abbey of Saint Vincent. It is under the jurisdiction of a mitred abbot, appointed by the Pope, and under the same general supervision is a large and increasing number of monasteries. The abbey at Saint Meinard, Ind., which was founded in 1853, is a filiation of the celebrated Benedictine Abbey of Einsiedeln, in Switzerland. The first convent of Benedictine nuns in the United States was established at Saint Mary's, Pa., in 1853.

BENEDICTION (Lat., *benedicere*, to speak well), a solemn invocation of the Divine blessing upon men or things. The simplest form of this ceremony may be considered as almost coeval with the earliest expression of religious feeling. The Jewish patriarchs before they died invoked the blessing of God upon their children, and later on the priests were commanded to solicit Divine blessing upon the people. The custom, being sanctioned by Christ, was carried forward into the Primitive Church, where it gradually developed in different forms. In the Eastern as well as the Western Church it is regarded as an essential preliminary to almost all important acts.

BENEDICTUS, the so-called "canticle of Zachary" (Luke i, 68-79), which forms part of the office of the lands in the Roman breviary. It has been set to music by all the most eminent composers.

BENEDIX, JULIUS ROBERT, German actor, manager, and play-writer, born at Leipzig in 1811, died there Sept. 26, 1873. Of his numerous pieces the best are his comedies, most of which are popular in Germany. His dramatic works fill 27 volumes.

BENEFICIARY, a term in law sometimes applied to the holder of a benefice. It may also denote a person who is in the enjoyment of any interest or estate held in trust by others.

BENEFIT OF CLERGY. See *Britannica*, Vol. V, pp. 827-28, and Vol. VIII, p. 372. The *Privilegium Clericale* was abolished in England by the act of June 21, 1827, and in Ireland by that of July 15, 1828. All doubt as to the liability of peers to punishment for felony was removed by Parliament in 1841. In the United States this anomalous privilege has been made the subject of aversive legislation by many of the individual States, some denying that the right ever legally existed in this country, others recognizing it as a part of the common law, follow in effect the federal act of April 30, 1790, which denies benefit of clergy to any one convicted of a capital offense.

BENEFIT OF INVENTORY, in Scottish law, a legal privilege, whereby an heir secured himself against unlimited liability for his ancestor by giving up, within the *annus doliherandi*, an inventory of his heritage or real estate, to the extent of which, and no farther, was the heir liable.

**BENEVOLENCE**, a name applied to a forced loan or contribution, levied by kings of England without legal authority. It was first so called in 1473, when asked from his subjects by Edward IV, as a mark of good-will towards his rule; but similar compulsory "free-will offerings" had not been uncommon in former reigns. Under Richard III, in 1484, an act of Parliament abolished benevolences as "new and unlawful inventions;" but, spite of this, they continued to be exacted by Richard himself and by Henry VII. In 1614 James I tried, but with little success, to raise money by this expedient, and it was never again attempted by the crown, Charles I expressly declining to have recourse to it. See *Britannica*, Vol. IX, p. 177.

**BENEZET**, ANTHONY, born at St. Quentin, France, Jan. 31, 1713, died at Philadelphia, Pa., May 3, 1784. He was a philanthropist, and devoted his attention to the abolition of the slave trade, to the education of the colored race and the alleviation of the condition of prisoners. He published a few works which are of a religious or historical nature.

**BENFEY**, THEODOR, the greatest orientalist and comparative philologist of modern times, born of Jewish parents, near Gottingen, January, 1809, died in 1881. He studied in Gottingen, Munich, Frankfurt, and Heidelberg, and in 1830 turned his attention to the study of Sanskrit. For an extended account of his career, see *Britannica*, Vol. XVIII, p. 781.

**BENGAL**, BAY OF, a portion of the Indian Ocean, into which flow the Ganges and the Bramahputra on the north, the Irrawaddy on the east, and the Mahanuddy, the Godavery, the Kistna or Krishna, and the Cavery on the west. The northern shore, measuring 250 miles, reaches from Balasore to Chittagong, and at the south the bay extends for 1,200 miles between Coromandel and Malacca.

**BENGAL LIGHT**, or BLUE LIGHT, a brilliant light used at sea for signaling, and in ordinary pyrotechny. It is prepared from nitre, sulphur and the tersulphuret of antimony, mixed in the following proportions by weight: Nitre 6, sulphur 2, tersulphuret of antimony 1. When ignited it bursts into rapid and vivid combustion, evolving a brilliant, penetrating, but mellow light. As the fumes evolved are poisonous, the light cannot be used in safety in inclosed spaces.

**BENI**, the name of a large river and also of a department of Bolivia. Chief towns of the province are Trinidad and Loreto.

**BENICIA**, a commercial and manufacturing city of California, and its former capital, is situated on the north side of Carquinez Strait, at the head of navigation for large sea-going vessels, about midway in a direct line between San Francisco and Sacramento. One of the principal objects of interest is the old capitol, a fine brick edifice overlooking the water-front from a commanding eminence. Benicia barracks and the United States arsenal for the Pacific coast are located here. Among the principal manufactories are flour, leather, and hydraulic cement;—large quantities of superior limestone being quarried in the vicinity. Benicia is the seat of St. Augustine College, and of a law school, a number of young ladies' seminaries, and a Dominican monastery.

**BENI-HASSAN**, a village of Upper Egypt, on the east bank of the Nile. The place is remarkable for the numerous grottoes in its vicinity, which are among the most interesting in Egypt. These catacombs, which are excavated in the calcareous bank, are about thirty in number, and are supposed to have been used as sepulchres by the principal inhabitants of Hermopolis, a city that stood on the opposite side of the river. The paintings, though not

so artistic as those in the Theban catacombs, are of earlier date, and throw much curious light on the manners and customs of the ancient Egyptians.

**BENI-ISGUEN**, a large town in the interior of Algeria, surrounded by a rampart flanked with towers, and said to be nearly as populous as Algiers. It has some trade in grains.

**BENI-ISRAEL** (SONS OF ISRAEL), a remarkable race in the west of India, who preserve a tradition of Jewish descent, and have from time immemorial acknowledged the law of Moses, although in many respects conforming to the idolatry of the Hindus, by whom they are surrounded. Their features exhibit a resemblance to those of the Arabian Jews. Until recently they were ignorant of many of the books of the Old Testament, and it was not without hesitation that they consented to receive those of the later prophets. They are supposed to be a remnant of the ten tribes, and to have settled in India long before the Jews of Cochin. They object to the name of Jew, and deem its application to them a reproach.

**BENI-SOUEFF**, a town of Egypt, capital of the *moudirieh* or province of the same name, situated on the left bank of the Nile, about sixty-five miles above Cairo, with which it is connected by railroad. It is a pretty and well-built town; contains a number of cotton-mills and alabaster quarries, and is the entrepot for the produce of the rich valley of Fayoom.

**BENITIER**, or BENATURA, the name of the vase or vessel in which "holy water" is held in Roman Catholic churches. Benitiers were either movable or fixed. Portable ones, commonly of silver, were used in processions. The benitiers belonging to the church of St. Sulpice in Paris are remarkable for their great beauty. They are formed of magnificent shells and bordered with gilt copper.

**BENJAMIN**, JUDAH PHILIP, born at St. Croix, West Indies, Aug. 11, 1811, died at Paris, May 8, 1884. His parents were English Jews, and his boyhood was spent in Wilmington, North Carolina. He studied at Yale, but did not complete the course. After reading law in New Orleans he was admitted to the bar in 1834. He rose to prominence in the profession, was U. S. commissioner in 1847 appointed to investigate Spanish land-titles, was admitted to practice in the U. S. Supreme Court, was presidential elector at large in 1848 from Louisiana, and elected to the United States Senate in 1852. He belonged to the Democratic party, and when the Southern confederacy was formed he held successively the offices of attorney-general, secretary of the war department, and then secretary of state till the overthrow of the confederacy. Jefferson Davis placed great confidence in Mr. Benjamin's ability, and the latter was called "the brains of the confederacy." On the downfall of the confederacy Mr. Benjamin made his escape from Richmond and sailed for Liverpool. Although fifty-four years old he began the study of English law, and in a few years his practice was both extensive and lucrative.

**BENJAMIN**, PARK, born at Demarara, British Guiana, Aug. 13, 1809, died at New York city, Sept. 12, 1864. His father was a native of Connecticut, but carried on business in Demarara. The son was very lame, and at an early age was sent to New England for education and medical treatment. He studied at Harvard and Trinity, and then read law, but his inclinations were in favor of literature. He went to New York and was associate editor of the "American Monthly Magazine" and afterwards of the "New Yorker." He was on the staff of several other publications, most of which were unsuccessful. He was a contributor to various periodicals

and the author of the poems: *The Meditation of Nature; Poetry; a Satire; Infatuation; The Nautilus; To One Beloved; The Departed; and The Old Saxon.*

**BEN-LAWERS**, a mountain in Perthshire, Scotland, about 32 miles from Perth, on the west side of Loch Tay. This mountain is easy of ascent and rich in specimens of alpine plants. A magnificent view is commanded from its summit, which has an elevation of 3,945 feet. Ore of titanium is found in the mountain.

**BEN-LEDI**, a mountain of Perthshire, 4 miles from Callander, with an elevation of 2,863 feet. It received its name from the Druids, who are supposed to have had a place of worship on its summit. This mountain is celebrated in Scott's *Lady of the Lake*.

**BEN-LOMOND**, a lofty mountain the northwest of Stirlingshire, Scotland, on the east side of Loch Lomond. This mountain, forming the southern extremity of the Grampians or Central Scottish Highlands, is 3,192 feet high, and consists of mica and slate, with veins of quartz, greenstone, and feldspar porphyry. The summit is steep on the north, with a gentle declivity on the southeast. It is covered with vegetation to the top. Though considerably surpassed in height by several other Scottish mountains, none are more imposing. Seen from Loch Lomond, it appears a truncated cone, and between Stirling and Aberfoyle a regular pyramid. It has been ascended by a greater number of tourists than any other of the Highland mountains. The magnificent view from the top in clear weather includes the whole length of Loch Lomond, which is 30 miles. The north semicircle of the horizon is bounded by Bens Lawers, Voirlieh, Ledi, Cruachan and Nevis, while some of the beautiful Perthshire lochs are seen.

**BEN-MACDHUI**, a mountain of Aberdeenshire, belonging to the Grampian range. It has an elevation of about 4,296 feet.

**BENNET**, JAMES GORDON, JR., born in New York city, May 10, 1841. He is the only son of the founder of the "Herald." He became proprietor of this paper on the death of his father. He is very fond of yachting, and has taken part in two famous races with English yachts. His *Henrietta* won in 1866, but his *Danless* was beaten in 1870 by the English *Cambria*. He has acquired fame and advanced the interests of his paper by publishing in England storm-warnings from the United States signal service, by fitting out the *Jeannette* for a polar expedition, and by sending Henry M. Stanley to search for Livingstone. Mr. Bennett resides most of the time in Paris, where he attends to the foreign news department of his paper. In 1883 he and John W. Mackay formed the Commercial Cable Company, and laid a new line between America and Europe.

**BEN-NEVIS**, a lofty mountain in the county of Inverness, Scotland. It has a height of 4,406 feet, is exceedingly difficult of ascent, with a precipice of 1,500 feet in depth on the northeast side, where snow remains throughout the year. Granite and gneiss form the base of the mountain, which, in its upper part, is composed of porphyry.

**BENNINGSEN**, LEVIN AUGUST THEOPHILUS, count (1745-1826), a distinguished Russian general, born at Brunswick in 1745. He joined the Russian army in 1773, and in the Turkish war soon attracted the notice of the Empress Catharine, who employed him to carry out her designs against Poland. He was one of the leaders of the conspiracy against the Emperor Paul. He fought with success in the battle of Pultusk in 1806, and held the chief command in the obstinate and murderous struggle at Eylau in 1807. When Napoleon invaded

Russia in 1812, Bennigsen commanded the Russian center on the bloody field of Borodino, and gave orders for fighting a second battle before the walls of Moscow. Before the French began their retreat he gained a brilliant victory over Murat at Woronowa. In 1813 he fought victoriously in the battle of Leipsic, and was created count by the Emperor Alexander on the field. He retired to his estate in Hanover, where he died in 1826.

**BENNINGTON**, the largest manufacturing town of Vermont, in the southwestern part of the State, 36 miles from Troy, N. Y. It is the county-seat of the county of the same name. Noted for the battle of Bennington, Aug. 16, 1777, where General Stark, at the head of the "Green Mountain Boys," defeated a detachment of Burgoyne's army. Bennington, North Bennington and Bennington Center are the three villages of the town of Bennington. A soldiers' home and excellent schools are at Bennington. Some of the articles manufactured here are iron, woolen goods, pottery, chairs and lumber.

**BENUÉ**, an important river of Central Africa. It enters the Quorra or Niger from the east, about 230 miles above the mouth of the river in the Gulf of Guinea.

**BEN-RHYDDING**, a health resort in the West Riding of Yorkshire on the River Wharfe, 16 miles from Leeds.

**BENSHIE**, or **BANSHEE**, an imaginary being in the superstitions of the Irish—a female who is called the wife of the faeries, and who makes herself known by wailings and shrieks, premonitory to a death in the family over which she is presumed to exercise a kind of guardianship. A similar superstition prevailed, and is, perhaps, not yet extinct, in the Highlands of Scotland.

**BENSON**, EDWARD WHITE, an English divine, born at Birmingham in 1829. He became chancellor of Lincoln Cathedral in 1872; bishop of Truro in 1877; archbishop of Canterbury in 1883.

**BENSON**, EGBERT, jurist, born in New York city June 21, 1746, died in Jamaica, L. I., Aug. 24, 1833. He graduated at King's College; was first attorney-general of the State; was in the State legislature, and from 1784 to 1788 sat in Congress. He was judge of the Supreme Court, 1794-1802; was in Congress again from 1813-1815; was first president of the New York Historical Society, and enjoyed many other honors and offices.

**BENSON**, EUGENE, painter, born in Hyde Park, N. Y., in 1837. He studied art in New York, Paris, Venice and Rome, and traveled much in Europe and the East. In the list of his paintings are *Cloud Towers*, *Hay Boats*, *Bazaar at Cairo*, *Hashish Smokers*, *Fire-worshippers*, *State Secret in Venice*, *Art and Love*, and *Ariadne*.

**BENSON**, JOSEPH, an English divine and author, best known for his highly esteemed *Commentary on the Holy Scriptures*, and his *Apology for the Methodists*. He died in 1821.

**BENT GRASS** (*Agrostis*), a genus containing about sixty species of grasses, widely distributed through temperate and cold climates. All are of slender and delicate appearance. Some are very useful as pasture-grasses and for hay, on account of their adaptation to certain kinds of soil. The common bent grass, *Agrostis vulgaris*, abounds in dry, elevated pastures. *A. canina* is also very common. *A. dispar*, the American herds-grass, is cultivated in France. Most of the European species are North American also.

**BENTHAM**, GEORGE, an English botanist, born in 1800 at Stoke, a village since absorbed in Portsmouth, died Sept. 10, 1884. The son of an officer who had risen to high rank in the Russian and the English service, young Bentham's earlier years

were spent largely abroad, but from 1826 to 1832 he lived in London with his uncle, the jurist, and studied law. In 1827 he published *Outlines of a New System of Logic*, in which is set forth for the first time the doctrine of the quantification of the predicate. He was called to the bar, but soon abandoned the law for botany. He catalogued the plants of the Pyrenees (1824-26), and was elected in 1828 a Fellow of the Linnean Society, and in 1829 secretary of the Horticultural Society. From this time he devoted himself entirely to his new study, and soon published his important *Labriatarum Genera et Species* (1832-36). In 1854 he presented his collections to the Royal Gardens at Kew, where he prosecuted his studies during the remainder of his life. *Genera Plantarum* (3 volumes, 1862-83), in the completion of which he was assisted by Sir Joseph Hooker, is exhaustive and valuable, and may be said to summarize our present knowledge of botany. He was president of the Linnean Society from 1863 to 1874, and was a member of many other British and foreign learned bodies.

**BENTHAMIA**, a genus of plants of the natural order *Cornaceæ*, consisting of Asiatic trees or shrubs, of which the fruit is formed of many small drupes grown together. *B. frugifera*, a native of Nepal, is a small tree, with lanceolate leaves, and a reddish fruit, very much like a mulberry, only somewhat larger; it is quite pleasant to the taste. The flowers are fragrant.

**BENTON, JAMES GILCHRIST**, soldier and inventor, born at Lebanon, N. H., Sept. 19, 1820, died at Springfield, Mass., Aug. 23, 1881. He was a graduate of the military academy in 1842. He assisted in the preparation of the "System of Artillery for the Land Service," and the "Ordnance Manual" in 1847. He served the following year at Harper's Ferry armory, and afterwards in the San Antonio ordnance depot. From 1849 to 1861 he was assistant inspector of arsenals, engaged in making experiments which led to the adoption of Springfield rifles, and an instructor of ordnance and gunnery at the military academy. For most of the time during the civil war he was commander of the Washington arsenal. Twice he performed acts of great bravery in extinguishing fire which had begun to burn in the arsenal and in a magazine; for his hardihood he was made lieutenant-colonel and colonel. He invented several military appliances, but never took out a patent, as he believed the Government which had educated him was entitled to his services.

**BENTON, THOMAS HART**, born near Hillsborough, Orange county, N. C., March 14, 1782, died at Washington, D. C., April 10, 1858. On account of his father's death when he was but eight years old, Thomas had few educational advantages. He was able to attend a grammar school and to spend some little time at the University of North Carolina. He studied law and was elected to the legislature. At about this time he quarreled with Jackson, who had heretofore been his warm friend. The trouble was made up; but Mr. Benton, having started the "Missouri Inquirer," was a participant in several duels, in one of which he killed his antagonist. In after-life he deeply regretted the act. Mr. Benton was a leader in his party, and in 1820 was chosen United States Senator from the new State of Missouri. He was influential in passing laws in regard to unoccupied western land, which were of such a nature as to encourage settlers to take up claims. Another benevolent measure in which he was actively engaged was the throwing open to settlers the salt and mineral lands of Missouri, which belonged to the national government. Many beneficial public measures were fostered by him; he

advocated a railroad to the Pacific, encouraged exploration of the West, advocated a friendly policy with the Indians, and planned for the establishment of post-roads. When President Jackson, in his first annual address, advocated the withdrawal of public moneys from the national bank and placing it in State banks, a business panic was threatened. Col. Benton at this crisis made an exhaustive study of the financial question, and then advocated the adoption of gold and silver as a currency basis. His speeches on the money question were the most eloquent ever delivered by him. The sub-treasury system now in use is a development of Col. Benton's views put in practice. During the Mexican war his advice was largely followed by President Polk, who wished to put him in full command of the army. When the slavery question came up with regard to the newly-acquired Mexican States, there commenced a bitter hostility between Benton and Calhoun, which was intensified by the "nullification" measures. Through the influence of his enemies, Col. Benton lost party favor, and in a contest for senatorship, and subsequently for the office of Governor, he was defeated (1856). The last years of his life were devoted to literary work. *Thirty Years' View* is descriptive of the time in which he represented his State in the U. S. Senate. He wrote *An Abridgment of the Debates of Congress*, and *An Examination of the Dred Scott Case*. Col. Benton's wife had a paralytic stroke in 1844, and from that time he never went to a place of amusement. Although surrounded by many temptations, he never indulged in liquor, gaming or tobacco, saying simply that his mother had desired him not to form these habits. See *Britannica*, Vol. XXIII, p. 788.

**BENTON**, the county-seat of Franklin county, Ill., situated on a railroad, 77 miles northeast of Cairo and 90 miles southeast of St. Louis, Mo. It has churches, a high school, a bank, a jail and several manufactories.

**BENTON HARBOR**, an important trading and manufacturing town of Michigan, situated on St. Joseph's River, near its entrance into Lake Michigan. It is the commercial center of an extensive fruit-growing industry, and contains important manufactories of fruit-baskets, canned fruit, furniture, lumber and flour.

**BENTONVILLE**, a town of Arkansas, county-seat of Benton county. It contains a number of manufactories, and is extensively engaged in the tobacco trade.

**BENTONSVILLE**, a small village of Johnston county, N. C., famous for a battle between the armies of General Sherman and General Johnston, March 21, 1865.

**BENYOWSKY, DE, MAURICE AUGUSTUS**, count, born in Hungary in 1741, died in battle in 1786. He was a man of remarkable character and extraordinary fortunes. He took part in the Seven Years' War, and in 1767 joined the Polish confederation, taking a prominent part in the campaign against the Russians until May, 1769, when he was captured; about seven months later, after being confined in several Russian prisons, he was banished, first to Siberia, and then to Kamtehatka. He escaped from the latter place to France in May, 1771, and shortly after, by proposal of the French government, he established a colony at Madagascar, himself arriving on the island in February, 1774. He was proclaimed king by the chiefs in conclave in 1776, and adopted the costume of the natives, but he fell into contention with the French government of the Isle of France, and was at last slain.

**BENZENE**. See *Britannica*, Vol. V, pp. 560, *et seq.* Benzene is extensively employed in the arts

as a solvent for fats, gums and resins, and as the basis for the manufacture of aniline and the aniline colors. It is also the source of many medicinal compounds, especially of salicylic and benzoic acids.

**BENZERTA**, or **BIZERTA**, **LAKES OF**, the ancient *Fipponitis Palus* and *Sisara Palus*, two lakes within the dominions of Tunis, and about 30 miles from the coast. They are each about ten miles long, and the larger one, which is clear and salt, is six miles broad; the smaller, which is turbid and fresh, is three miles broad. They are two miles apart, but united by a channel. Tunis is supplied with fish mainly from these lakes.

**BENZILE**, or **BENZOYLE**, the radicle or root of the group of substances which comprehends as members the hydride of benzoyle, benzoic acid, benzoin and benzole. It is prepared by passing a stream of chlorine gas through fused benzoin, or by heating one part of benzoin with two parts of concentrated nitric acid. Benzile floats to the upper part of the liquid mixture as a liquid oil, which solidifies on cooling. It is a tasteless solid, insoluble in water, but readily dissolved by ether and alcohol.

**BEOWULF**, an Anglo-Saxon epic poem, one of the greatest literary curiosities and most remarkable historical monuments in existence. The events narrated probably occurred in the middle of the 5th century; and, as the legends relate to the Teutonic peoples who afterwards inhabited England, it is supposed that the poem was brought by them from the continent. The only known copy is in the British Museum. See *Britannica*, Vol. VIII, pp. 403, 404.

**BEQUEATH**, to leave personal property by will or testament to another. In the case of real estate the correct term is devise. Neither of these words is essential to the validity of a will, although it is usual and safe so to use them; other words, showing clearly the intention of the testator, will suffice.

**BERAT**, a town of Albania, European Turkey, in the pashalik of Avlona, situated on the banks of the Tiberathi, about 30 miles northeast of the seaport of the same name. The valley in which Berat stands is very fertile, producing large quantities of grain, oil and wine. The population is about 10,000, two-thirds of whom are Greek, the remainder Turks. It has a citadel, and traces of ancient Greek buildings.

**BERBERIDEÆ**, a natural order of exogenous plants, of which the different species of Barberry are the best known examples. Many of the plants are spiny shrubs. This order, nearly allied to *Urticæ*, contains more than 100 species.

**BERCHTA**, the name given, in the south of Germany and Switzerland, to a mythological being who was apparently the same as Hulda in Northern Germany. The being represented originally one of the kindly and benign aspects of the Unseen powers, but in the course of time she became rather an object of terror; the difference probably arising from the circumstance that the influence of Christianity was felt, and the pagan deities were converted into demons. Lady Berchta was supposed to have the oversight of spinners. The last day of the year was sacred to her, and any flax left on the distaff that day she spoiled. Her festival was kept with a kind of meager fare—oatmeal gruel and fish. In some places she was represented as having a long iron nose and an immensely large foot. That she was once an object of worship is shown by the numerous springs, etc., that bear her name in Salzburg and elsewhere. Many of the Sagas of Berchta were transferred to the famous Berthas of history and fable. The numerous stories of the "White

Lady" have doubtless their root in the ancient Berchta.

**BERCK-SUR-MER**, a harbor and bathing resort in the French department of Pas-de-Calais, 22 miles south of Boulogne, with some ship-building and sail-making. Population, 5,187.

**BERCY**, a town of France, in the department of the Seine, situated on the right bank of the river of the same name. It forms a suburb of Paris, and has a large business in wines and other liquors. Population, about 15,000.

**BEREA**, a village of Kentucky, about 100 miles south of Cincinnati, the seat of Berea College, founded in 1858, in the interests of abolition by Rev. John G. Fee, a zealous advocate of the anti-slavery cause.

**BEREA**, a town of Ohio, 13 miles southwest of Cleveland. Baldwin University and German Wallace College (both under the care of the Methodist church) are situated here. Large quantities of sandstone are quarried in the vicinity.

**BEREANS**, a sect of Christians who originated in Scotland in the 18th century, but are now almost extinct. Their name is derived from the circumstance that the inhabitants of Berea "received the Word with all readiness of mind, and searched the Scriptures daily" (Acts xvii, 2). They believe that the knowledge of God's existence and character is derived from the Bible alone, and not from reason or Nature; that the Psalms of David do not relate to David at all, but exclusively to Christ. That assurance is of the essence of faith, and that unbelief is the unpardonable sin. Ordinarily, in their points of doctrine, they are Calvinistic. The founder of the Bereans was the Rev. John Barclay, a native of Perthshire. From him they also received the name of Barclayans. See *Britannica*, Vol. III, p. 369.

**BEREGH**, a town and a county of Hungary. The county is 140 square miles in extent, is quite mountainous, and the chief production is wine.

**BEREGONIUM** is a misprint in the Ulm edition of Ptolemy's Geography (1486) for *Rerigonium*, a town of Novantæ, now identified with the fort of Innermessan, on the east shore of the Loch Ryan.

**BERENGAR I**, king of Italy, the son of Eberhard, Duke of Friuli and of Gisela, daughter of the Emperor Louis the Pious. He was assassinated in 924.

**BERENGAR II**, son of Adalbert, Count of Ivrea, succeeded to his father's possessions in 925, and married Willa, niece of Hugo, King of Italy, in 934. Incited by his ambitious and unscrupulous wife, he conspired against Hugo, and in consequence was compelled to flee to Germany, where he was received in a friendly manner by the Emperor Otto I. In 945 he recrossed the Alps at the head of an army, but, instead of assuming the crown himself, he handed it over to Lothaire, the son of Hugo. On the death of Lothaire, who was probably poisoned by Willa, he allowed himself to be crowned, along with his son, Adalbert, in 950. Two years later he engaged in war with the Emperor Otto, who sent his son Ludolf against him. Ludolf was successful, but died of poison administered, as was believed, by Willa in 957. Berengar again mounted the throne, but behaved with such intolerable tyranny that his subjects called in the aid of the emperor, who took possession of the country in 961. Berengar was sent as a prisoner to Bamberg, in Bavaria, where he died in 966. His wife, Willa, retired into a convent, and his three sons died in exile.

**BERESFORD**, **WILLIAM CARR**, viscount (1768–1854), an eminent English military commander. He entered the army in 1785, and twenty-five years

later was made a knight of the bath in acknowledgment of his aid at the battle of Busaco. The year following (1811) he was placed in command during the battle of Albuera, which he won, receiving for this the thanks of Parliament. He became baron in May, 1814, and in 1823 he was created viscount.

BERESLAV, a thriving town in the Russian government of Kherson, on the Dneiper. Population, 11,000.

BERETTYO-UJFALU, a market town of Hungary, in the county of Bihar, with a population of 6,000.

BEREZNA, a town of Russia, in the government of Tchernigov, on the Desna. Population, 10,000.

BEREZOV, or BERESOFF ("The Town of Birch Trees"), an important town on the left bank of the Sosva, in the government of Tobolsk, Siberia. Although it is a small place it is the only fur and skin trading station throughout a large tract of country. Prince Menschikoff, the favorite of Peter the Great, having been banished to Siberia, died and was buried here. His grave being opened ninety years after, it was discovered that his body, clothed in the uniform of the time, was undecayed. A fair, which is largely attended, is held here annually. See *Britannica*, Vol. III, p. 587.

BEREZOVSK, a village in the Russian province of Perm, near Ekaterinburg, which gives name to a famous gold-field, worked since 1744. The mines are on the eastern slopes of the middle Ural chain, and the field is above five miles long. The washings on the Berezovka River are also very productive.

BERG, BURG, or BURGH, roots entering into composition of many names of places. *Berg* (in German) means "hill," and "mountain," and *burg* or *burgh* means "fort," "castle," "citadel," probably from being situated on a hill or eminence.

BERGA, a town of Catalonia, Spain, 52 miles northwest of Barcelona. Population, 5,000.

BERGAMOT, a name of various kinds of pear, to which, however, no common distinctive character can be assigned. The proper Bergamot pear is flattish, rough-skinned, with a long stalk, a very juicy pulp, as soft as butter, of an extremely pleasant flavor, and is esteemed one of the best dessert pears.

BERGEDORF ("Hill Village"), a manor and borough of Germany, belonging to Hamburg, since 1867. The people are well-conditioned and industrious, and engaged in agriculture, cultivating fruit and vegetables for the London as well as the Hamburg market. See *Britannica*, Vol. XI, p. 404.

BERGERAC, SAVINIEN CYRANO, born in France, about 1620, died in 1655, from a wound received in a duel. He was a poet, novelist, and dramatist, and also a notorious duelist. He was admired as a writer of romance, and his works of this character were much read in the 17th century. As a poet and dramatist, he ranks second only to his contemporaries, Molière and Racine.

BERGH, HENRY, born in New York city in 1823, died March 12, 1888. He was of German descent, and his father was a wealthy ship-builder for the government. Henry Bergh and his brother succeeded to the ship-building business at the father's death, but it was not to the taste of Henry Bergh, so he abandoned the business and entered Columbia College. Before completing the course he went to Europe, where he spent five years. In 1862 he was appointed secretary of legation at St. Petersburg. Ill-health compelled him to resign two years later and he went to London, where, among other

famous people, he met the Earl of Harrowby, President of the Royal Society for the prevention of cruelty to animals. Mr. Bergh was much interested in the welfare of dumb animals; possibly the sights witnessed in St. Petersburg first led him to a consideration of this subject. Returning to New York in 1864 he set about organizing a society for the prevention of cruelty to animals. The following year the society was formed with Mr. Bergh as president. The work done by this society has been a noble one. Mr. and Mrs. Bergh gave largely of their abundance means for the work, and in 1871 Louis Bunard, a Frenchman residing in New York, died leaving a legacy of \$150,000 to the society. Through Mr. Bergh's influence similar societies have been formed in several cities, while 39 States have adopted laws for the protection of animals. In 1874 his attention was called to the inhumanity sometimes practiced upon children, and he founded the Society for the Prevention of Cruelty to Children. Mr. Bergh wrote plays, some poetry and a few sketches; but the work for which he will always be remembered is that in regard to kind treatment of children and animals.

BERGHAUS, HEINRICH, born in Rhenish Prussia in 1797, died in 1884. He was one of the most active promoters of geographical knowledge. His *Physical Atlas* (90 plates, Gotha, 1838-48) is the most prominent of his cartographical works. He also edited several geographical periodicals.

BERGHAUS, HERMANN, a German cartographer, of rare ability, connected for more than forty years with the great map-making and publishing house which bears his name in Gotha, Germany. For many years and reaching to the date of his death, Dec. 3, 1890, he was regarded as the highest authority in every department of geography. He was not a traveler, but a recluse, devoting a powerful genius and an indefatigable application to the researches of traveling and other geographers, ancient and modern. He never wearied in enlarging his fund of knowledge concerning all localities, however humble, of all countries, and brought his information down to the latest dates. In his comfortable work-room in Gotha he could furnish, without delay and without mistake, exact information in response to all inquiries in his professional line. One of his earliest tasks was the collection of statistics with regard to the measurement of heights, and one of the best-known monuments of his genius is his hypsometric and orographic map of Central Europe, which he published in 1857, which marked an epoch in map-making. One of his greatest works was his eight-sheet map of the world on Mercator's projection, which, appearing in 1863, has been sold by thousands all over the world, eleven editions having been issued under his direction. Undoubtedly his greatest work was that which he had not quite completed at the time of his death. It was the new edition of the "Berghaus Physical Atlas," first produced by his great uncle Heinrich, Berghaus, in 1852.

BERGLER, JOSEPH, an historical painter of considerable note, born at Salzburg in 1753, died in 1829. He was appointed director of the Academy of Prague in 1800. The impetus which he gave to the fine arts in Bohemia was very marked, and his school furnished a goodly number of eminent artists.

BERGMANN, FREDERICK WILLIAM, an eminent German linguist, born in Strasburg in 1812. In connection with theology he studied philology, in his native city. He continued his linguistic studies in Göttingen, Berlin and Paris, and in 1838 he became professor of foreign literature in the University of Strasburg. He has written numerous

ous important works on the Semitic and other languages.

**BERGMEHL**, or **MOUNTAIN FLOUR**, a deposit of white or cream-colored powder of extreme fineness, composed almost entirely of the indestructible siliceous frustules, or cell-walls of *Diatomaceæ*. From its resemblance to flour it has been mixed with ordinary food and used by the inhabitants of Norway and Sweden, who suppose it to be nutritious. In Maryland and Eastern Virginia an extensive bed of this organic matter occurs nearly 100 miles long, and 30 feet thick.

**BERGRÖE**, **WILHELM**, a distinguished Danish writer, born in Copenhagen in 1835. In early life he became noted as a zoölogist; but the use of the microscope induced temporary blindness, and he turned his attention to poetry, and afterwards to writing of novels. His productions were very popular.

**BERGUES**, a town of France, in the department of the Nord, five miles from Dunkirk. The canal of Bergues, which admits vessels of 300 tons burden, unites it with Dunkirk and the sea, and its favorable situation makes it the entrepot of the produce of the adjoining country. It has manufactories of soap, tobacco, earthenware, and also sugar and salt refineries. Population, 5,500.

**BERGYLT**, a fish of the Mailed Cheek family, or *Sclerogenidæ*, the family to which gurnards and sticklebacks belong, but so much resembling the perch that it was formerly called Sea-perch. It is an inhabitant of all the Northern seas, is of a red color; its gill-covers are armed with short spines. It attains a length of two feet and upwards. It is good for food, and the Greenlanders use it not only in a fresh but also in a dried state.

**BERHAMPUR**, the name of two towns in British India.—(1) Berhampur in Madras is a military station in the district of Ganjam, 18 miles southwest of the town of Ganjam, and but nine from the coast. The climate is very healthful, and there is some trade in sugar and in silk fabrics. Population, about 24,000.—(2) Berhampur in Bengal, situated on the left bank of the Bhagirathi, five miles below Murshidabad. It was long one of the principal military stations in British India, and the barracks, now largely devoted to other uses, still form the most important feature of the town. In 1857 Berhampur was the scene of the first open act of mutiny. Population, about 24,000.

**BERI**, a town of India, in the British district of Rohtak, Punjab, 36 miles northwest of Delhi. It is a considerable trade center with two large fairs, in February and October. Population, about 10,000.—The state of Beri, in Bundelkhand, has an area of about thirty square miles, and a population of 5,000.

**BERING**, **IVAN IVANOVICH**. See *Britannica*, Vol. XIX, p. 318; also Vol. III, pp. 509-10. "The term *Bering Sea* has been variously written Behring Sea, Bhering Sea, Beering Sea, Bering Sea, as well as Behring's Sea, Beering's Sea, etc. This name was given to the sea in honor of its first explorer. Similarly the strait which connects it with the Arctic Ocean, an island in the sea, and a bay on the northwest coast of America, have received the name Bering.

"When the Czar Peter the Great determined to send out an exploring expedition to ascertain whether Asia and America were united by land he selected to lead this expedition Captain Commander Ivan Ivanovich Bering. Bering was the son of Jonas Svendsen by his second wife, Anne Pedersdatter Bering, and was born at Horsens, in Jutland, in the summer of 1681. On his mother's side he was descended from the distinguished Be-

ring family, which during the 17th and 18th centuries flourished in various parts of Denmark, and included a number of ministers and judicial officers. Baptized on the 12th of August, 1681, he received the baptismal name Vitus Jonassen Bering. On entering the Russian navy, however, he took, as was the custom of the Danish and Norwegian officers serving in Russia, a new or Russianized form of name. This form is Ivan Ivanovich Bering. The name Ivanovich is an exact translation of Jonassen—in English, Johnson or John's son. All the Russian and Danish records agree as to the spelling of the family name; both in Danish and in Russian it is Bering. His autograph is always written Bering.

"The insertion of an *h* in the name, giving the form Behring, appears to have been made in Germany.

"In 1748 was published Harris's *Collection of Voyages*, in two folio volumes. In the second volume, pages 1016-41, is contained 'A distinct account of part of the northeast frontier of the Russian Empire, commonly called the country of Kamshatka or Kamshatska, including the voyages of Captain Behring for discovering toward the east, etc., collected from the best authorities, both printed and manuscript.' This account was prepared by Dr. Campbell, who made use of the form Behring. From this it may be inferred, as pointed out by Mr. Wm. H. Dall, that Dr. Campbell did not have access to original documents, but got his material from German sources or from German translations of the original. As Harris's *Voyages* is an elaborate work, long accepted as a standard, the use of the form Behring gained wide adoption among English-speaking people. That the form Bering should be adopted, however, appears—(1), because it is the form always used by Bering himself, by his ancestors for five generations at least, and by his descendants; (2), because it is the form almost, though not quite, universally adopted in all non-English works; and (3), because even in English works it is gradually superseding the form Behring."—[*Bulletin U. S. Board on Geographic Names*, Dec. 31, 1890.]

**BERJA**, a town of Spain, in the province of Andalusia, at the foot of the Sierra de Gador, 22 miles west of Almeira. It has manufactories of linen fabrics, hats, hardware and leather, and a trade in wine and oil. Population, about 8,000, chiefly engaged in mining lead, which is plentiful in the Sierra de Gador.

**BERKELEY**, an important educational town of California, beautifully situated near the Bay of San Francisco, about five miles north of Oakland. It is the seat of the University of California, the State Agricultural College, and the Institution for the Deaf, Dumb and Blind.

**BERKELEY**, a town five miles north of Oakland, in Alameda county, California. The University of California, the California Institution for the Deaf, Dumb and Blind, and the State Agricultural College are here located.

**BERKELEY**, **MILES JOSEPH** (1803-1889), a distinguished English botanist. He was educated for the church, and obtained a number of ecclesiastical preferments; but his fame rests upon his botanical researches and writings.

**BERKELEY**, **SIR WILLIAM**, colonial governor of Virginia, born near London, England, about 1610; died at Twickenham, July 13, 1677. He was highly connected, a graduate of Oxford, a traveler and accomplished courtier. The king honored him with a commission to Canada in 1632, and in 1641 appointed him governor of Virginia. During his first term of office he won the regard of the people and managed business with great shrewdness. When

Cromwell became Protector Berkeley influenced the people not to acknowledge his authority, and a fleet was sent from England to bring the colony and its governor to terms. Berkeley's diplomacy soon made matters smooth with the home government, but he had to resign his office. At the restoration Charles II reinstated Berkeley, but his second term of office was unsatisfactory. The so-called "Bacon rebellion" arose, provoked no doubt by Berkeley's infidelity to the Indians and his duplicity with regard to the patriot Bacon. The governor saw how unpopular he was making himself by his erratic conduct and he became bitter and inhuman. After Bacon's death he persecuted his followers and executed them with such indecent haste that the king said he had "taken more lives in that naked country than I have for the murder of my father." Berkeley was opposed to free schools, printing, and religious liberty. Charles II recalled him, intending to examine into the reports of his harsh measures, but Berkeley died soon after his return to Europe.

**BERKELEY SOUND**, the most frequented inlet of East Falkland Island, near its northeast extremity. It is in latitude  $51^{\circ} 30'$  south, and longitude  $57^{\circ} 56'$  west. Though it is difficult to enter, yet it contains several excellent harbors. Its shores yield ample supplies of water, cattle, and vegetables.

**BERKOVITZA**, the chief town of a district in western Bulgaria, 40 miles northwest of Sofia, situated on a small tributary of the Danube. Population, 5,500.

**BERLAD**, a town of Lower Moldavia, on the Burlad River, 40 miles above its junction with the Sereth. It is an important place, connected with Braila by rail, and has a brisk trade. Population, 27,000.

**BERLENGAS**, a group of rocky islands in the Atlantic off the west coast of the Portuguese province of Estremadura, 10 miles northwest of Peniche. The principal one, Berlenga, is fortified, and has been used as a state prison.

**BERLICHINGEN**, Vox, GOETZ or GOTTFRIED "of the Iron Hand," born in Wurtemberg in 1480, died in 1562. His career was varied, and with the exception of Ulrich von Hutten, he may be regarded as the last worthy representative of the chivalry of the Middle Ages, then expiring.

**BERLIN**, a town of Ontario, Canada, county-seat of Waterloo county, is situated on Grand River, about 60 miles west of Toronto. It contains a number of manufactories, the principal being buttons and malt liquors.

**BERLIN**, a city of Wisconsin, situated on Fox River, about a hundred miles northwest of Milwaukee. Here are extensive foundries and manufactories of turbine-wheels, woolen goods, flour, whips, boots and shoes and leather. Cranberries and dairy products are among the principal articles of trade.

**BERLIN SPIRIT**, a coarse whisky made chiefly from vegetables. Because of its cheapness it has been largely used in the making of brandy, and in mixing low wines.

**BERM**, in fortification, a pathway from three to eight feet in width, at the bottom of the outside of a rampart, where it joins the scarp or inner side of the ditch. It is almost on a level with the natural surface of the ground, and serves in part as a passage way for the troops of the garrison, and in part as a means of preventing the ditch from being filled with earth and rubbish.

**BERMONDSEY**, a southeast suburb of London, on the south bank of the Thames. It has extensive tan-yards and wharfs. Population, about 80,000.

**BERMUDA HUNDRED**, a village of Virginia, situated on the right bank of the James River, above the mouth of the Appomattox. It became known as the headquarters of General Butler during the siege of Petersburg.

**BERMUDAS**, a British colonial possession consisting of 365 small islands in the Atlantic ocean, 568 miles east of North Carolina, and 677 miles from New York. Total area, 20 square miles (12,000 acres—4,000 under cultivation). Population in 1889, 15,534, including 6,155 whites. Capital, Hamilton, with a population of about 8,000. For early history and description, see Britannica Vol. III, pp. 599, 600.

The executive administration is in the hands of a governor, assisted by a council of six members also appointed by the Crown. There is also a legislative council of nine appointed by the Crown, and a representative house of assembly of 36 members.

There were, in 1890, 47 schools with about 1,400 students, 23 of these schools receiving government grants to the amount of \$8,250 annually. Average strength of imperial troops 1,500. In 1890 the revenues were estimated at \$145,025, and the expenditure at \$150,380. Public debt in 1889, \$43,070. The value of onions exported in 1888 was \$296,000; lily bulbs, \$21,645; and potatoes, \$135,000. The Total exports in 1888 amounted to \$498,250.

In 1888 the total tonnage of vessels entered and cleared was 228,385, of which 199,199 were British. There are 32 miles of telegraph wire, and 15 of cable; in 1888 the number of messages sent was 22,467. There is also a private telephone company, which has over 120 subscribers and upwards of 300 miles of wire in line.

The Bermudas occupy areas of about 15 miles by 6, and are separated by very narrow channels. Only 18 or 20 are inhabited, and only five are considerable size. They are inclosed on three sides by coral reefs, nearly all under water, some of them extending 18 miles away.

Hamilton, Bermuda, has long been a place of pleasure and health resort by many persons from the United States and Canada. The climate is exceedingly attractive, especially in winter. Visitors find there ample hotel accommodations, and the voyage by steamer from New York generally free from peril by storm and helpful to health. Steamers ply regularly between Hamilton and New York, the voyage requiring about three days.

**BERMUDEZ**, a state in the northeast part of Venezuela, between the Orinoco and the Caribbean Sea formed in 1881 from the former states and present sections of Barcelona, Cumana, and Maturin. Area, 32,128 square miles; population 55,677.

**BERNALDA**, a town in South Italy, in the province of Potenza. Population, 6,976.

**BERNALILLO**, a wealthy agricultural and commercial town of New Mexico, situated on the Rio Grande, about fifteen miles above Albuquerque. It is an old town, and the seat of a convent and a college. It is an important outfitting station for the adjacent mining regions, and is the commercial and manufacturing center of an extensive wine-producing and fruit-growing district.

**BERNARD**, Abbot of CLUNY, born in Morlaix Brittany, about 1100. He was the author of *Jerusalem the Golden*, and other hymns, which Dr. Neale translated from the *De Contemptu Mundi*.

**BERNARD**, CLAUDE, born at Saint-Julien, in the department of the Rhone, died in 1878. He was an eminent physiologist, and held several high positions in the colleges of France, devoting himself to experimental researches in physiology. He discovered the glycogenic functions of the liver.

BERNARD DOG, GREAT ST. See Britannica, Vol. VII, p. 327.

BERNARD, GREAT St., a noted pass of the Penine Alps, over 8,000 feet above sea level. Napoleon crossed the Alps at this point in 1800, at the head of an army of 30,000 men. At the summit is the celebrated St. Bernard hospice.

BERNARD, SIR FRANCIS, born in Nettleham, Lincoln, England, in 1714, died at Aylesbury, England, June 16, 1779. He graduated at Oxford, and served in different offices of importance until 1768, when he was appointed governor of New Jersey. He was appointed to the same office in Massachusetts Bay Colony. He administered the office satisfactorily in the former colony, and for the first nine years in the latter place. The library of Harvard College was burned in 1764; and the governor, who took quite an interest in the college (his third son graduated from the institution in 1767), assisted in procuring funds for its restoration. About that time two political parties arose—a royalist faction and a popular party. In trying to strengthen the former, Governor Bernard executed harsh measures and put down popular leaders, thereby rousing great indignation and precipitating the final struggle between the mother country and her colonies. It is affirmed that he did more to hasten the Revolution than any other man. He had a quick, ungovernable temper—the unhappy faculty of doing just those things which would harass a people already on the brink of mutiny. Conciliatory measures he never tried. The king recalled him, yet he remained nominal governor for two years after his return to England.

BERNAUER, AGNES, the daughter of a citizen of Augsburg, and the heroine of a sad romance of the 15th century. Duke Albrecht of Bavaria, only son of the reigning Duke Ernst, seeing her at a tournament, fell in love with her beauty, and they were secretly married. When it was proposed that he should marry Anna, daughter of Erieh, duke of Brunswick, Albrecht declared his marriage with Agnes Bernauer, and brought her to the Castle of Straubing as duchess of Bavaria. Duke William, Albrecht's uncle, befriended the young people; but after his death, and during the absence of Albrecht, Agnes was arrested by order of her father-in-law, charged with sorcery, and drowned in the Danube. On his return her husband, maddened by the outrage, gathered the enemies of his father, and taking arms against Duke Ernst they devastated the country. See Britannica, Vol. XXII, p. 591.

BERNE-BELLECOUR, ETIENNE, a French artist, born at Boulogne-sur-mer in 1838. His earlier works were portraits and landscapes, but his fame rests upon his later *genre* and military paintings.

**BERNHARD, DUKE OF WEIMAR** (1604-1639), a celebrated German general, the youngest of eight sons of John, third duke of Saxe-Weimar. On the outbreak of the Thirty Years' War he took the side of Protestantism, and distinguished himself in 1622 at the battle of Wimpfen. He became colonel in the army of Christian IV, king of Denmark. He took part in the bold expedition of Mansfeld through Silesia to Hungary, and after the death of the latter he reunited himself with the Danes under the markgraf of Baden-Durlach. At the solicitation of his brothers he withdrew from the Danish service, and returned to Weimar in 1628. Three years later Gustavus Adolphus made his appearance in Germany, and Bernhard was one of the first who flew to his standard. After a brilliant career he became suddenly ill, and died at Neuburg on the Rhine in 1639. He was probably poisoned by his physician, who is supposed to have been in the pay of France.

BERNHARDT, ROSINE, called Sarah, a French actress, born of Jewish parents in Paris, Oct. 22, 1844. She was baptized into the Christian faith, and brought up in a convent at Versailles. Entering the Paris conservatoire in 1858, she gained second prizes for both tragedy and comedy, and in 1862 made her début as "Iphigénie" at the theater Français, but attracted so little notice that she soon left the theater, only to meet with still less success in burlesque at the Gymnase and Porte St. Martin. In 1867 she played minor parts at the Odeon, and became famous by her impersonation of the "Queen of Spain" in *Ruy Blas*, and of "Zanetto" in Coppée's *Passant*. She was called to the Theater Français in 1872, and after 1879 made annual appearances, with marked success in London. Her tours in North and South America, in Italy, Russia, etc., were also pecuniarily successful; but her essay at the management of a Paris theater involved her in heavy debt. In 1882 she was married to M. Jacques Daria, or d'Amala, a Greek actor, from whom she was divorced shortly afterwards. Her later successes as an actress have been in *La Tosca*, *Joan of Arc* and *Cleopatra*. She is now (1891) filling her second season of engagements in the United States. Madame Bernhardt is probably the greatest *tragedienne* since Rachel, and in comedy also she ranks as a finished actress. Her talent as an artist is considerable, and both paintings and statues from her studio have appeared in the Salon.

BERNHARDY, GOTTFRIED, a German scholar, born of Jewish parents near Frankfort in 1800, died at Halle, May 14, 1875. He was educated at Berlin, and in 1829 became director of the philological seminary at Halle. Of his numerous philological works may be mentioned his *Syntaxis Griechischen Sprache* (1829); *Paralipomena Syntaxis Græcæ* (1854); and the critical edition of *Suidæ Lexicon* (4 volumes, 1834-53). His works on Roman and Greek literature, especially the history of the latter, are also of high value.

BERNĪCIA, a form of the word *Bryneich*, used to indicate the northern part of what became the kingdom of Northumbria, the part north of the Tees. The Anglian kingdom of Bernicia is said to have been founded by Ida, who made his capital at Bamborough about A. D. 550. See *Britannica*, Vol. VIII p. 270; Vol. XVII, p. 568.

BERNIER, FRANÇOIS, a French physician and traveler, born at Angers in France, died at Paris in 1688. Having taken his degree of doctor, he departed for the East in 1654, and visited Syria, Egypt, Arabia and India; in the last he resided for 12 years in the capacity of physician to Aurungzebe. He published an account of his travels in 1670. The work is delightful in style as well as in the description of places, and clear in exposition of the causes of those political events that carried Aurungzebe to the throne.

BERNINA, a mountain of the Rhaetian Alps, upwards of 13,000 feet high, in the Swiss canton of Grisons, with a remarkable and extensive glacier, Morteratsch. The Bernina Pass, which is 7,628 feet high, unites the valleys of the Engadine and Bregaglia on the north, with Valteline on the south, but is dangerous on account of avalanches. See Britannica, Vol. XXIV, p. 45.

BERNSTEIN, GEORGE HEINRICH, a distinguished orientalist, born at Kospeda, near Jena, in 1787, died in 1860. Bernstein devoted himself to the study of theology, philosophy, and Eastern languages, and his greatest achievements were in Syriac literature. He contemplated publishing a great Syriac lexicon, but did not live to complete the work.

BEROË, one of the commonest representatives of the most intensely active sub-class of *C. bacillales*—

the *Ctenophora*. It is the type of the small family *Beroidea*. These are free-swimming pelagic animals, of great delicacy and beauty, generally of more or less cylindrical form and without any trace of skeleton. They are transparent and often beautifully colored, and one of the most brilliant examples of phosphorescent marine animals. During the day they descend to deeper water, but come to the surface at night. The distribution of the genus, which includes three certain species, is very wide. See *Britannica*, Vol. I, p. 132.

BERRE, ETANG DE, an extensive lagoon of France, department Bouches-du-Rhône, with large salt-works and eel-fisheries. It discharges its surplus waters into the sea by the Port-du-Bouc.

BERRI, or BERRY, formerly a province of Central France, now forming the departments of Indre and Cher. Having come, in 1100, into the possession of the French crown, it was raised to a duchy in 1360, and gave title at various times to French princes, the younger son of Charles X being the last who held it.

BERRYVILLE, a small village in the Shenandoah Valley, the county-seat of Clarke county, Va. It is sometimes called Battletown on account of having been the scene of many Revolutionary contests of General Morgan.

BERSAGLIERI, the Italian name for riflemen and sharpshooters of the Sardinian army. During the Italian war of 1859 the *bersaglieri* were engaged in many operations requiring dash and brilliancy.

BERSERKER, or BERSERK, derived from the Icelandic *berserkr*, meaning either "bare-sark," without a shirt, or, more probably, "bear-sark," having a bear's shirt or hide. Berserker, grandson of the eight-handed Starkader and the beautiful Alfhilde of Norse mythology, is represented as a hero who, despising mail and helmet, went always into battle unharnessed, his fury serving instead of defensive armor. The *berserkers* of later times were a class of warriors who are said to have performed extraordinary feats in battle under the influence of fits of fury called *berserks-gang*, "Berserker's rage," which made them houl like wild beasts, foam at the mouth, and gnaw the rims of their shields, and was supposed to endure them with superhuman strength and to render them proof against fire and steel.

BERT, PAUL, a French statesman and physiologist, born at Auxerre in 1833, died in 1886. He studied law and medicine, and occupied successively the chairs of Physiology at Bordeaux and Paris. Entering political life in 1870, on the proclamation of the Republic, he was four times re-elected to the Chamber, and during the premiership of Gambetta held the post of minister of public instruction and worship. While engaged in public life, M. Bert still pursued with ardor his scientific investigations, attracting world-wide attention by his experiments in vivisection. He was appointed by the French ministry to the governorship of Tonquin and Anam in 1886, but held the position for a short time only, his death occurring in November of the same year.

BERTH, in nautical language, a term nearly equivalent to *room* or *space*; a ship's berth is the space which she occupies when at anchor, including a small breadth of sea all around her. The same name is also given to a messing or sleeping-room on board ship, in a sense not very different from that of the word *cabin*.

BERTHA, the name of several famous women of the Middle Ages, half-historical and half-fabulous. St. Bertha, whose day is kept on the 4th of July, was the beautiful and pious daughter of King Charibert, of the Franks, who, having married (A. D. 560) Ethelbert, king of Kent, became the means of

his conversion and of the spread of Christianity among the Anglo-Saxons.

BERTHIER, ALEXANDRE, Prince of Neuchatel and Wagram, and marshal of the French Empire, born at Versailles in 1753, died in 1815. He joined the army in 1770, and with LaFayette took part in the American Revolution. He accompanied Napoleon to Egypt as chief of staff. At the revolution of 18th Brumaire (1790), he became war minister. He was Napoleon's proxy in the marriage of Maria Louisa, at Vienna, in 1810. He held the rank of chief of the staff, and also that of quartermaster-general during the campaigns of 1812, 1813, and 1814, and was continually at the Emperor's side. When Napoleon returned from Elba, Berthier left the service of Louis XVIII, preferring neutrality, and retired to Bamberg, Bavaria.

BERTIN, LOUIS FRANÇOIS, an eminent French journalist, born in Paris in 1766, died in 1841. He began writing for the press in 1793, and in 1799 set on foot the "Journal des Débats." His royalist principles offended the government of Napoleon, and cost him imprisonment and banishment to Elba, but he escaped to Rome, where he formed a friendship with Chateaubriand. In 1804 he returned to Paris, and resumed the editorship of the "Débats."

BERTRAND, HENRI GRATIEN, COUNT, born in Chateauroux in 1773, died in 1844. He was one of Napoleon's generals, distinguished for his faithfulness to the Emperor through all his fortunes. He early entered the armies of the Revolution as engineer. When the body of Napoleon was carried back to France in 1840, he had a part in the expedition.

BERVIC, CHARLES CLEMENT BALVAY, born at Paris in 1756, died in 1822. He was a distinguished engraver, and executed a full-length engraving of Louis XVI in 1790, through which he became famous. Other of his works, the engravings of the Laocoön, Regnault's *Education of Achilles*, and Guido's *Rape of Deianira*, display equal beauty of manipulation and higher power.

BERWICK, a manufacturing town in Columbia county, Pa., on the north branch of the Susquehanna River and the Lackwanna and Bloomsburg Railroad. It has a graded school, several churches, two potteries, foundries, a machine shop and a rolling mill.

BERWICK, NORTH, a seaport town of Haddingtonshire, at the entrance of the Firth of Forth, 19 miles east-northeast of Edinburgh. Corn is exported from it, and it is frequented as a bathing place. It includes the Bass Rock, North Berwick Law, and the ruins of Tantallon Castle, which is graphically described in Scott's *Marmion*. North Berwick Law is a conical hill of an elevation of 940 feet on the south, close to the town. Population, 4,000.

BESSEMER, Alabama, a flourishing and rapidly growing railway center in the iron region of the State; at this writing, 1891, it may be reached by eight railways. Population in 1890, 4,544; Precinct 33, including Bessemer, Sloss, and Woodward towns, 5,782.

BESSEMER CITY, Michigan, a new, thriving, and rapidly developing mining town in Gogebio county. Population of Bessemer in 1890, 2,566; township, 680.

BESSEMER, SIR HENRY, an English civil engineer and inventor, born at Chatham, in Hertfordshire, in 1813. His name is well known in connection with his principal invention, the Bessemer process of refining steel.

BESSIERES, JEAN BAPTISTE, Duke of Istria, and marshal of the French Empire, born at Preissac in

1768, died in 1813. He was promoted in succession to the ranks of general of brigade, general of division, and marshal of France, and in 1809 was created Duke of Istria for his services in Spain. He was mortally wounded on the morning of the battle of Lützen, while leading on foot the *tirailleurs* to reconnoiter the field from the defile of Rippach, and in him Bonaparte lost one of his best officers and his most faithful friend. The news of his death was concealed from the army throughout the day.

**BESTIARES**, the name given to a class of written books of great popularity in the Middle Ages, describing all the animals of creation, real or fabled, and generally illustrated by drawings. They were most in fashion during the 11th, 12th and 13th centuries. They served as encyclopedias of the zoology of those ages, but they had also another use. The symbolism which was then so much in vogue fastened spiritual meanings upon the several animals until every quality of good or evil in the soul of man had its type in the brute world. To the Bestiaries we must look for explanation of the strange creatures found sculptured on churches and buildings of the Middle Ages.

**BETANZOS**, a town of Spain, in the province of Corunna, 10 miles southeast of the city of the same name. Ancient granite gateways still defend its narrow streets; it has manufactories of linen, leather, and earthenware. Population, 5,000.

**BETHANY**, a small village of W. Va. in Brook county, on Buffalo Creek. Bethany College is located here; it was established in 1841 by Rev. Alexander Campbell, LL.D., founder of the "Disciples of Christ," otherwise known as the "Christians."

**BETHANY COLLEGE**, at Bethany, W. Va., was established in 1841, by the Rev. Alexander Campbell, LL.D., the founder of the denomination called "Christians," but better known as Disciples of Christ. This institution had in 1890 nine professors, two tutors and 164 collegiate students. It maintains also a theological department. The alumni number nearly 800, representing 32 States and several foreign countries. The three college buildings and apparatus are valued at \$300,000. The productive funds are nearly \$100,000, and efforts are in progress for increasing the latter to at least half a million dollars.

**BETHLEHEM**, an educational and manufacturing town of Pennsylvania, the principal settlement in the United States of the Moravians, or "United Brethren," is pleasantly situated about 50 miles north of Philadelphia, on the left bank of the Lehigh River, across which a bridge connects it with South Bethlehem, the seat of Lehigh University. Bethlehem was founded in 1741. The first house, in which, in that year, Count Zinzendorf and his little band of Moravian brethren celebrated the festival of the Nativity was not taken down until 1823; and one of the first houses of the settlement is still standing. Besides containing a number of benevolent institutions conducted by the Moravians, Bethlehem is the seat of their theological seminary, boys' school, and young ladies' seminary. It was in the latter—used during the Revolution as a military hospital—that Lafayette was nursed after having been wounded at the battle of Brandywine. The principal manufactures of Bethlehem are flour, brass implements, boilers, shovels, and cigars.

**BETHLEHEMITES**, the name of an order of monks at Cambridge, England, in the 13th century; also of an order founded in Guatemala in 1673. The followers of Jerome Huss were styled Bethlehemites, from Bethlehem church, in Prague, where their leader preached.

**BETHLEN GABOR** (1580-1629), a descendant of an ancient and eminent Protestant family of Upper

Hungary. He became distinguished during the troubles which distracted the principality in the reigns of the two Bathories, Sigismund and Gabriel. When the latter died, Bethlen Gabor became sovereign prince of Transylvania.

**BETHNAL GREEN**, an eastern suburb of London, since 1885 a parliamentary borough. It is largely peopled by silk-weavers, an offshoot of the Huguenot settlement in Spitalfields. Its museum, opened by the Queen in 1872, is a branch of the one at South Kensington. Population, 127,000.

**BETHSAIDA**, on the lake of Galilee, mentioned in Scripture as the city of Peter and Andrew and Philip, now a heap of ruins almost overgrown with grass.

**BETH-SHEMESH**, an ancient city of the Holy Land, about 15 miles southwest of Jerusalem. Ruins at the present village of Ain-Sheims lead scholars to believe this was the site of Beth-Shemesh. Samson's exploits were performed in this vicinity.

**BETHUNE**, GEORGE WASHINGTON, born in New York city, March, 1805, died in Florence, Italy, April 27, 1862. His parents were noted for their Christian charity. He graduated from Dickinson College, Carlisle, Pa., and from the department of theology at Princeton, after which he became a Presbyterian minister. In 1826 he was chaplain to the seamen of Savannah; from 1826 to 1830 pastor of the Reformed Dutch Church at Rhinebeck, N.Y.; from 1830 to 1834 pastor in Utica, N. Y.; from 1834 to 1848 pastor at Philadelphia, Pa.; from 1848 to 1859 pastor in Brooklyn. Failing health compelled him to visit Europe, where he sometimes preached in the only Protestant church of Rome. A short pastorate in New York was followed by a visit to Florence, Italy, where he died. Dr. Bethune was a well-read student of English literature, a writer of merit, and an orator and man of influence in his times.

**BÉTON**, or **BÉTON AGGLOMÉRÉ**, a kind of concrete used in the construction of submarine works and other buildings. See *Britannica*, Vol. VI, p. 243; see also under **BUILDING**, *Britannica*, Vol. IV, pp. 456-57; and under **BRIDGES**, Vol. IV, p. 324, *et seq.*

**BETONY** (*STACHYS BETONICA*), a common European labiate plant, growing in woods. It was of great repute in ancient and mediæval medicine; and is sometimes used to dye wool, producing a dark-yellow color.

**BETTIA**, a municipal town in the northwest of Behar, India, on the line of the Tirhut state railway. Population 21,263, of whom 13,943 are Hindus.

**BETTING**. See *Britannica*, Vol. III, pp. 618-19. In the United States, the legislative enactments of the various individual States, proceeding upon the basis of the common law, declare betting to be an indictable offense. Gambling houses are held, on various grounds, to be illegal; and the collection of a bet cannot be enforced by law. A note payable upon receipt of election returns is void in Illinois, Indiana, Iowa, Connecticut, Delaware and Maryland. A bet on a horse race is void in Pennsylvania and New York. All bets are declared void by the laws of Texas and California. In many of the States a stakeholder may be compelled to refund money to the loser which he has already paid to the winner of a bet. Indorsements upon paper which has been given as payment of a bet, though the paper may have passed into the hands of an innocent party, are void in Illinois. Where no such laws exist, the decisions of the courts are, as a rule, averse to all forms of betting.

**BETTOLA**, a town of Italy, in the duchy of Parma, about 20 miles southeast of Piacenza. It is situated on the Nure, in a fertile but only partially cultivated district. Population, 6,000.

**BETTS, SAMUEL ROSSITER**, born at Richmond, Mass., June 8, 1787, died Nov. 2, 1868. He graduated at Williams College in 1806, and practiced law in Sullivan county, New York. He was called one of the ablest American jurists. He served in the war of 1812, became judge advocate, sat in Congress (1815-17), was judge of the circuit court of the State for three years, and from 1826 to 1867 was U. S. district judge. He was among the first to formulate maritime laws for the United States, and his decisions in this department and in that of patents, of national and international rights, have been uniformly upheld. He published a work on admiralty practice.

**BETTYS-Y-COED**, a village in Carnarvonshire, North Wales, situated at the point where the Conway receives the Llugwy, 15 miles south of Llandudno Junction, by rail. It is remarkable for the beauty of its location.

**BEUGNOT, ARTHUR AUGUST, COUNT DE**, a French statesman and author, born at Bar-sur-Aube in 1797, died in 1865. In 1841 he was made a peer of France, and was a member of the legislative assembly in 1849. His most important writings related to Judaism, to the overthrow of western paganism, and to the institutions of Saint Louis.

**BEURMANN, FRIEDERICH, COUNT VON** (1835-63), a German explorer. In 1861 he explored the country of the Bogos, and then set out in search of Vogel, who was supposed to have been murdered in Wadai. After many unsuccessful attempts he reached Wadai, where he was murdered by the natives.

**BEUST, VON, FREDERICK FERDINAND FREIHERR**, (1809-86), a German statesman, and one of the most distinguished modern politicians. He represented his government at Munich in 1838, and eight years later he went to London in the same character, whence he was removed to Berlin in 1848; the year following he was called to Dresden, where he received the portfolio of foreign affairs, and a few years later he became minister of the interior. See *Britannica*, Vol. XXI, p. 356. When Frederick VII of Denmark died (1863), Beust came forward prominently as the exponent of the German national feeling on the Schleswig-Holstein question. He was always the friend of Austria, and in the crisis of 1866 he supported her, joining in the declaration of war against Prussia, contrary to the wishes of at least the liberal party in Saxony. When the "six weeks' war" ended he resigned his office by demand of Prussia, and entering the service of Austria he rose to the head of affairs. See *Britannica*, Vol. III, p. 141. The chief result of his policy in the reorganization of the empire was the reconciliation of Hungary on the footing of its remaining a separate kingdom.

**BEVEL**, an instrument used by artisans for drawing angles and adjusting the inclination of abutting surfaces. It consists of a handle and blade jointed together and capable of being adjusted so as to include any desired angle.

**BEVELAND**, North and South, two islands in the estuary of the Scheldt, Holland, separated by a channel on the west from the island of Walcheren. The estimated area is about 120 square miles, with a population of about 23,000. Both islands have suffered dreadfully from inundations, but within recent years much good has been effected by drainage.

**BEVEREN**, a town of Belgium, in East Flanders. The principal industry is the making of point-lace. Population, 8,000.

**BEVERIDGE, WILLIAM**, bishop of St. Asaph, born in Barrow in 1638, died in 1708. He was ordained deacon and priest in 1660, after having ob-

tained the degree of M.A. He refused to accept the bishopric of Bath and Wells when Dr. Thomas Ken was deprived of it for his refusal to take the oaths to the government of William III, and was in 1704 appointed to that of St. Asaph. The greater portion of his property was bequeathed to the societies for the Promotion of Christian Knowledge and for the Propagation of the Gospel in Foreign Parts.

**BEVERLAND, ADRIAN**, born in Zeeland about the middle of the 17th century, died in England about 1712. He was a Dutch scholar, whose unorthodox writings on original sin and the fall of man caused much excitement in his day, but are now regarded as mere literary curiosities.

**BEVERLOO**, a village of Belgium in the province of Limbourg, 12 miles northwest of Hessel. On the extensive heaths surrounding it the Belgian army encamps yearly for exercise.

**BEVERLY**, a manufacturing town and summer resort of New Jersey, pleasantly situated on the Delaware River, fifteen miles above Philadelphia. The principal manufactures are woollens, oil-cloth and rope.

**BEVERLY**, a city of Essex county, Mass., in Beverly township, on a bay or inlet of the Atlantic and on the Boston and Maine (Eastern) Railroad, 18 miles northeast of Boston, two miles north-northeast of Salem, at the junction of the Gloucester Branch, (Cape Ann). It is separated from Salem by an inlet of the sea which is crossed by a bridge. It has a good harbor, fine streets and avenues lighted by gas and electricity, extensive shoe and leather manufactories, steam grain elevators, machine and wood-working shops, oil-cloth and enamel works, steam printing establishments, a national and a savings bank, the Beverly cooperative bank, excellent hotels, an efficient police, a well-organized fire department, the New England Institute for the Deaf and Dumb, graded schools, a high school, a public library of 10,000 volumes, and a board of trade composed of 100 business men. Many of the inhabitants are employed in navigation and the fisheries. Valuation of real and personal estate, \$15,000,000. Beverly was incorporated in 1668, and has recently become a city. Population in 1890, 10,795. See *Britannica*, Vol. III, p. 621.

**BEVERWYK**, a town of Netherlands, North Holland, seven miles north of Haarlem. It is situated in the midst of what might be described as a beautiful meadow and is quite a model of Dutch neatness and cleanliness. Population, 2,356.

**BEVIS OF HAMPTON**, the hero of a popular English mediæval romance edited by Dr. E. Kölbing for the Early English Text Society, in 1885. See *ROMANCE*, *Britannica*, Vol. XX, p. 653.

**BEX**, a village in the Swiss canton of Vaud, situated on the high road to the Simplon, about 26 miles southeast of Lausanne. It is remarkable for its extensive salt mines, salt works, and sulphur baths. The quantity of salt annually produced at Bex is between 2,000 and 3,000 tons. Population, 3,000.

**BEYERLAND**, an island of South Holland, formed by the junction of the Old Maas with Holland Diep on the one side, the river Spui uniting the Old Maas with the Haringvliet on the other. It is a thriving place, of nearly 4,000 inhabitants.

**BEY**, a Turkish title. See *BEA*, in these Revisions and Additions.

**BEYPUR**, a seaport of Western India, in Malabar district, Madras, situated near the mouth of the Beypur River, six miles south of Calicut. Iron ore and coal are found in the neighborhood, and iron works have been established here. Since 1858 Beypur has acquired importance as the terminus of

a railway across the peninsula of India from Madras by way of Coimbatore. Population, 7,000.

BEZANT, or BYSANT, properly the *solidus*, a coin of the Byzantine empire which had a wide circulation in Europe during the period from about A. D. 800 to the middle of the 13th century. The gold bezant varied in value at different periods from a sovereign to half a sovereign; the silver one from a florin to a shilling. In architecture, small round disks ornamenting a molding, and in heraldry "roundels" on a shield, showing descent from a crusader.

BEZDAU, a market town in the Hungarian province of Baes, situated on the canal which joins the Theiss and the Danube. Population, 8,000.

BEZOAR, a concretion found in the stomachs of goats and antelopes, and formerly much valued on account of imaginary medicinal virtues, particularly as an antidote to poisons.

BHAGAVAD-GITA (that is, Revelations from the Deity), the title of a religious metaphysical poem, interwoven as an episode in the great Indian epic poem of the Mahābhārata.

BHAGIRATHI, the name of two rivers of India, one of which is a principal head-stream of the Ganges, and the other an affluent of the Ganges, known in its lower course as the Hoogly.

BHANPOORA, a walled town of Indore, Central India. It is situated on the Rewah, and contains a fort and a palace of the Mahratta ruler, known as the Holkar.

BHARTRIHARI, the name of a celebrated Indian writer of apothegms. Very little is known of his life. A legend makes him the brother of King Vikramāditya, who lived in the first century before Christ, and relates that after a wild, licentious youth he betook himself in later years to an ascetic life. Cheerful descriptions of Nature and charming pictures of love alternate in these apothegms, with wise remarks upon the relations of life, and profound thoughts upon the Deity and the immortality of the soul. Bhartihari is the first Indian author known in Europe; two hundred of his apothegms were translated in 1653 by Abraham Roger, published under the quaint title, *Open Gates to Hidden Heathenism*. Bohnen published an excellent and successful metrical translation in German (Hamburg) in 1835.

BHAVANI-KUDAR, a town in the presidency of Madras in the district of Coimbatore, 58 miles from the city of that name, at the confluence of the Bhavani and the Caverry rivers.

BHOOL, the capital of Cutch, in India, situated at the foot of a fortified hill of the same name, where a temple has been erected to the Cobra da Capella. Its mosques and pagodas, interspersed with plantations of dates, give to the town an imposing appearance from a distance. In 1819 it suffered severely from an earthquake. It is celebrated for its manufactures in gold and silver. Population, 20,000.

BHOWAN, BHOWANJ, BHEWANNEE, or BHIWANI, a town in the district of Hissar, Punjab, British India.

BHUJ, or BHI, a small hill state extending along the left bank of the Sutlej, in India, for about twenty miles. Its greatest breadth is about seven miles.

BHUTAN, an independent state in the Eastern Himalayas, on the northeast of Tibet. Area, 16,800 square miles. Population, 35,000. Capital, Punakha. For early history, see Britannica, Vol. III, p. 631.

Since 1865 the Indian government bestows on the Bhutan rulers an annual subsidy of 50,000 Rs., and in return is permitted to hold two strong fortresses (Buxa and Dewangiri) as a protection from warlike

incursions. The state is 160 miles in extreme length east and west and 90 miles in extreme breadth.

The government of Bhutan resembles that of Tibet, the chief authority being nominally divided between the *deb raja*, or secular head, on the one hand, and the *dharma raja* or spiritual head of the state on the other. Practically, the *deb raja* is a mere instrument in the hands of powerful barons. The *dharma raja* is supposed to be the incarnation of his predecessor, and is chosen in infancy. The chief towns of Bhutan are: Punakha, the capital, a place of great natural strength, Tashichhu Jong, Paro, Angdaphorang, Tongsa, Tarka, and Biaka.

The people are nominally Buddhists, but their religious exercises consist chiefly in the propitiation of evil spirits and the recitation of sentences from the Thibetan Scriptures. Tashichhu Jong, the chief monastery in Bhutan, contains 300 priests.

The chief productions of Bhutan are rice, Indian corn, millet, two kinds of cloth, musk, ponies, chowries, and silk. Muzzle-loading guns and swords of highly-tempered steel are manufactured.

The trade between British India and Bhutan amounted in 1888-89 to 153,000 Rs. imports from and 252,000 Rs. exports to India. The chief imports are tobacco, European cotton goods, betel-nuts and rice; the chief exports, wool, musk, ponies, and caoutchouc.

BIALYSTOK, a fortified town in the government of Grodno, Russia. It carries on various manufactures, among them woollens, hats, leather, soap, and tallow.

BIANCAVILLA, a town of Sicily, 14 miles north-west of Catania, and 10 miles from Mount Etna, with a trade in grain, cotton, and silk. Population, 9,000.

BIANCONI, CHARLES (1786-1875), inventor of the Irish car system, born in Lombardy in 1786, and came at the beginning of the century to Ireland as an itinerant vendor of cheap prints. He accumulated a small capital, and, recognizing the need of public conveyance in Ireland, he started the first car between Clonmel and Cahir in 1815, at a time when peace and the carriage-tax had filled the market with cheap horses and jaunting-cars. The enterprise proving a success, the system was extended, until, 40 years later, Bianconi's cars were working over 4,000 miles of road daily. Having realized a large fortune, he retired in 1865, and died in September, 1875, at his estate near Cashel.

BIARD, AUGUSTE FRANÇOIS, a French painter, born at Lyons in 1800, died in 1882. He was at first destined for the church, but was educated at the school of art in his native city. He is distinguished for his animated and often comical representation of ordinary life and manners, but is known in almost every department of his art.

BIBERICH, a village in the duchy of Nassau, on the right bank of the Rhine, about four miles south from Wiesbaden. It is noted for its splendid palace. The views of the river scenery from Biberich are unrivaled. Population, including Mosbach, 6,700.

BIBLICAL ARCHEOLOGY. Early in 1890 Dr. John Fraser, of New South Wales, read before the Victoria Institute a highly interesting paper entitled *The Aborigines of Australia; Their Ethnic Position and Relations*. He presented a strong argument in refutation of the position taken up by Lenormant and others, who would cut off the Australians from the record in the tenth chapter of Genesis, and, by consequence, from all connections with the sons of Noah. Dr. Fraser identifies the dark race spoken of in the euneiform inscriptions, as existing in the plains of Babylonia, with the Kushites; whose empire and whose people once

extended "from the Mediterranean to the Ganges, and from the Indian Ocean northwards to the plateau of Ararat. Other races, however, came down upon them from Central Asia, and, like a wedge, split them in two. Hence the position of this race is, in Genesis x, indicated ethnically by the names of Cush and Mizriam, and Phut and Canaan, which are the countries geographically called Ethiopia and Egypt and Nubia and Palestine. Their dominion had thus been thrown much to the west of their original seats, and had lodged itself in Africa, near the stronghold of the western Kushites," whose eastern brethren, after migrations and adventures which had led them "through the mountain passes into the tableland of the Punjab, and thence into the Gangetic plains," were "pushed," by Aryan invaders from the northwest, "down the Ganges into Farther India and the Malayan Peninsula; thence to pass at a later time into Borneo and the Sunda Islands and Papua; and afterwards across the Sea of Timor into Australia, or eastwards into Melanesia, driven onwards now by the Turanian tribes who had come down from Central Asia into China and the peninsula and the islands of the East Indies." Dr. Fraser fortifies his position with arguments and illustrations of various kinds—linguistic, ethnological, and religious.

Two other papers worthy of special note in this article were read before the same institution during the year 1890: One (Jan. 20, 1890) by James Neil, M.A., bearing the descriptive title of *Land Tenure in Ancient Times, as Preserved by the Present Village Communities in Palestine*; and the other, read by Mr. Hormuzd Rassam, June 23, discussed *The Garden of Eden and Biblical Sagas*. Mr. Rassam examined, to reject, the views of scholars who would localize the cradle of mankind in various places "from Scandinavia to the South Sea Islands, from China to the Canary Isles, and from the Mountains of the Moon to the coasts of the Baltic." He claimed that the arguments put forth in the brochure, *Wo lag das Paradies?* by Prof. Friedrich Delitzsch, the latest

supporter of the Babylonian theory, were "quite untenable when compared with the plain words of Holy Writ." Mr. Rassam's contention was "that the only part of the world that could be assigned for the ancient site of the Garden of Eden would be the country that surrounds Lake Wan (or Van) in Armenia." It should be noted, however, that Mr. Rassam probably had not read the books of President W. F. Warren, LL.D., of Boston University, entitled *Paradise Found; The Cradle of the Human Race at the North Pole*, as he makes no allusion to the ingeniously elaborated argument presented in that volume.

Dr. Edward Taylor, F.R.S., in discussing, at one of the society's meetings in 1890, *The Winged Figures of the Assyrian and Other Ancient Monuments*, is reported to have adopted and enforced with great emphasis the striking point of comparison, noticed many years ago by Sir H. Layard, of the Assyrian sculptures with the mystic vision of the prophet Ezekiel. The Chevalier Ernest de Bunsen, whose reputation is intimately connected with the subject of Biblical chronology, contributed a paper on *The Pharaohs of Moses According to Hebrew and Egyptian Chronology* to the February meeting of the society; to the June meeting of which a paper was submitted and read in abstract—appearing afterwards at length, and in the original French in the *Proceedings of the society—Sur les Dynasties Divines de l'Ancienne Égypte*, by Professor G. Maspero. It is conversant about the origin, the constitution, and the distribution of the divine dynasties, which, according to tradition, had preceded the human dynasties in Egypt, and whose record had furnished the basis of diverse hypotheses on the past on the part of students of Egyptian history and chronology. M. Maspero accepts the solution of the question proposed thirty years ago by Lepsius, in his *Mémoire sur le Premier Cycle des Dieux Égyptiens*, as being in the main true.

**BIBLE CHRISTIANS.** See RELIGIOUS DENOMINATIONS in the United States, in these Revisions and Additions.

**BIBLE CIRCULATION.** For the general discussion of questions relating to the Bible and its circulation by various organizations to the year 1875, see *Britannica*, Vol. III, 634-650. The annual report of the British and Foreign Bible Society for the year ending March 31, 1890, showed a total issue for that year, by that society, of 3,792,263 copies of Holy Scriptures. This was an increase over the issues of the preceding year of 115,059. The great increase of the work of the British and Foreign Bible Society during the last few years may be seen by the following tabular statement of its total issues by decades:

|                                      |            |
|--------------------------------------|------------|
| Total issues to March 31, 1820.....  | 2,843,291  |
| For ten years to March 31, 1830..... | 3,710,507  |
| "    "    "    1840.....             | 5,768,473  |
| "    "    "    1850.....             | 10,787,579 |
| "    "    "    1860.....             | 14,417,778 |
| "    "    "    1870.....             | 21,868,843 |
| "    "    "    1880.....             | 28,771,748 |
| "    "    "    1890.....             | 35,760,627 |

Grand total from date of organization..... 123,929,046

The receipts for the year ending March 31, 1891, aggregated \$1,060,387; total expenditures for the year, \$1,137,820. Total expenditures from the beginning of the society (86 years), \$54,969,407.

The American Bible Society issued during the year ending March 31, 1890, an aggregate number of 1,496,057 copies; increase over the preceding

year of 55,602. Its total issues from 1816, the date of its organization, to March 31, 1890, aggregated 52,736,075. The cash receipts for the year aggregated \$597,693.

The number of issues of the two societies (British and Foreign and American Bible Societies) during 1890 aggregated 5,288,317 copies, an average of about 17,000 copies of the Scriptures for every working-day of the year. For a full list of the parent Bible societies, with the latest total number of issues reported by each, see **BIBLE SOCIETIES**, in these Revisions and Additions. The grand total of issues to date circulated by all the societies was 217,828,118.

In not a few cases no written language or dialect was found, and the missionary teacher was required to give the people first a language and then the translation of the Bible into it.

The following are specimens of the languages and dialects into which the Bible, or portions of it, had been translated and printed up to the year 1890. The number of languages into which the Bible, or portions of it, were translated, printed, and circulated, directly or indirectly, by the British and Foreign Bible Society and the American Bible Society to that date, was 291. After making due allowance for repetitions, the specimens here given represent 213 languages and dialects. They are arranged very nearly according to the countries in which they originated. The reader begins with the languages of the British Isles, 1 to 6, and proceeds to the Continent of Europe, 7 to 68. The languages

of Asin come next, 69 to 162; then the islands, 163 to 185; then those of Africa, 186 to 217; and, finally, those which are peculiar to the American continent, 218 to 242.

In some cases, as will be noticed, the specimen is repeated to show the different alphabets or characters which the people use. The Turkish version, for example, is prepared for Moslems in the Arabic letter; but for Armenians an entirely different form is needed, and for Greeks yet another. Except where otherwise indicated, the Scripture verse here given is that of John iii: 16.

### 1. ENGLISH.

For God so loved the world, that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life.

### 2. GAELIC.

(Highlands of Scotland.)

Oir is ann mar sin a ghràdhaich Dia an saoghal, gu'n d'thug e 'aon-ghin Mhìe fein, chum as ge b'e neach a chreideas ann, nach sgriosar e, ach gu'm bi a'bheatha shìorrùidh aige.

### 3. IRISH.

Óir is mar sin do dhéanadh, Ófa an domhan, go dtug sé a éiníneán Dheige [féin], ionnóir gídh bé éneidheag agh nac raedadh sé a mhúga, aed go mbeidh an bheatha shìorruidh aige.

### 4. IRISH (Roman).

Oir is mar so do ghrádhúigh Dia an domhan, go dtug sé a éingheinn Meie fein; ionnus gidh bé chreideas ann, nach rachadh sé á mughá, aedh go mbeith an bheatha shìorruidhe aige.

### 5. MANX.

(Isle of Man.)

Son lheid y ghraih shen hug Jee da'n theihll, dy dug eh e ynryean Vae v'er ny gheddyn, nagh jinnagh quoi-erbee ehredjagh aynsyn eherraghtyn, agh yn vea ta dy bragh farraghtyn y chosney.

### 6. WELSH.

Canys felly y carodd Duw y byd, fel y rhoddodd efe ei unig-anedig Fab, fel na choller pwy bynnag a gredo yuddo ef, ond caiffael o hono fywyd tragywyddol.

### 7. BRETON.

(Brittany.)

Rag evel-se eo eu deus Doue caret ar bed, ma en deus roed e Vab unik-ganet, evit na vezo ket collet pioubenag n gred ennau, mes ma en dovezo ar vuez eternal.

### 8. FRENCH.

Car Dieu a tellement aimé le monde, qu'il a donné son Fils unique, afin que quiconque croit en lui ne périsse point, mais qu'il ait la vie éternelle.

### 9. FRENCH BASQUE. (Pyrrhences.)

Jaincoac eeen hain maite iñan du mundua, non eman baitu bere Seme bakharra, amoreagatic norcere sinhesten baitu hura balthan gal ez dadin, bainan çan deçan bethiereco bieia.

### 10. SPANISH.

Porque de tal manera amó Dios al mundo, que haya dado á su Hijo unigénito; para que todo aquel que en él creyere, no se pierda, mas tenga vida eterna.

### 11. CATALAN. (Eastern Spain.)

Puix Deu ha amat de tal modo al mon, que ha donat son unigenit Fill, á fi de que tot hom que creu en ell no peresca, ans be tinga la vida eterna.

### 12. SPANISH BASQUE.

Alchatuco naiz, eta juango naiz nere aitagana, eta esango diot: Aita, pecatu eguin nuen eeruaren contra, eta zure aurrean.—(Luke xv. 18.)

### 13. SPANISH BASQUE. (Guipuscoan Dialect.)

Joaten eeratela bada eman zayozeatzute era-cutsiax jende guciai: batayatzén dituzutela Aitaren, eta Semearen, eta Espiritu santuareu icenean.—(Matt. xxviii. 19.)

### 14. GITANO. (Spanish Gipsies.)

Mangue ardiñelaré, y ehalaré al batuseli, y le penaré: Batu, he querdi erejete contra o Tarpe y anglal de tueue.—(Luke xv. 18.)

### 15. PORTUGUESE.

Porque de tal maneira amou Deos ao mundo, que deo a seu Filho unigenito; para que todo aquelle que nelle creê, não pereça, mas tenha a vida eterna.

### 16. ICELANDIC.

Því svo elskaði Guð heiminn, að hann gaf sinn eingetinn Son, til þess að hver, sem á hann trúir, ekki glatist, heldur hafi eilíft líf.

### 17. NORWEGIAN.

Þíi saa haver Gud elsket Verden, at han haver givet sin Een den eenbaarne, saa det at hver den, som tror paa ham, ikke skal fortæbes, men have et evigt Liv.

### 18. SWEDISH.

Thi så älskade Gud världen, att han utgaf sin enda Son, på det att hvar och en, som tror på honom, skall icke förgås, utan få evinnerligt lif.

### 19. NORWAY-LAPPONESE (or Quanian).

Dastgo nuft rakkasen ani Ibmei mallme, atto barnes sán addi, dam aiuo, amas juokkaš, gutte su ala ássko, lapput, mutto vai agalaš sellem sán ážusi.

**20. LAPPONESE.**

**30. WENDISH (Upper). (Lusatia.)**

ʒſchetoj tak je Boh ten ʒwjet lubowal, so won  
ſwojejo jenujlejo narodzenjo ʒohna dat je, so blychu  
ſchity, ſij do njego wjerja, ſhubeni nebyli, ale wječne  
žiwenje mjeli.

**31. WENDISH (Lower). (Lusatia.)**

ʒſcheto tak je Boh ten ſwjet lubowal, az won  
ſwojogo jednorodzonego syna dat jo, aby ſchytne  
do njego wjerze, ſhubone nebyli, ale to ſlmerne žiwene  
měll.

**32. BOHEMIAN.**

Nebo tak Bůh milowal ſwět, že Syna ſwého gedno-  
rozeného dat, aby lžby, kdož wěrj w něho, nezahynul,  
ale měl život wěčný.

**33. HUNGARIAN.**

Mert úgy szereté Isten e' világot, hogy az ő  
egyetlenegy szülött Fiját adná, hogy minden,  
valaki hiszen ő benne, el ne vesszen, hanem  
ör k életet vegyen.

**34. HUNGARIAN-WENDISH. (Wends in Hungary.)**

Ar je tak lübo Bóg ete szvèt, da je Sziná szvo-  
jega jednorodjenoga dáó, dá vszáki, kí vu nyem  
verje, sze ne szkvari, nego má 'zítek vekivecsní.

**35. SLOVENIAN.**

Kajti tako je Bog ljubil svet, da je sina  
svojega edinorojenega dal, da kdorkoli veruje  
va-nj, ne pogine, nego da ima večno živiljenje.

**36. LATIN.**

Sic enim Deus dilexit mundum, ut Filium  
suum unigenitum daret, ut omnis qui credit  
in eum non pereat, sed habeat vitam eternam.

**37. ITALIAN.**

Perciocchè Iddio ha tanto amato il mondo,  
ch'egli ha dato il suo unigenito Figliuolo,  
acciocchè chiunque crede in lui non perisca,  
ma abbia vita eterna.

**38. ROMANESE (Oberland). (Switzerland.)**

Parchei Deus ha teniu il mund aschi car, ca el  
ha dau siu parsulnaschiu figl, par ca scadin, ca crei  
en el, vomî buc á perder, mo hagi la vita perpetna.

**39. ROMANESE (Enghadine). (Switzerland.)**

Perche chia Deis ha taunt amâ 'l muond, ch'el  
ha dat seis uigenuit Filg, aciò chia seodün chi  
craja in el nun gaja á perder, mo haja vita eterna.

**40. PIEDMONTESE.**

Pèrché Iddiun a l ha vòulsù tanton ben al  
mound, ch'a l ha dàit so Fieul unie, pèr ché  
chiounque a i prèsta sede a perissa nen, ma  
ch'a l abbia la vita eterna.

## 41. VAUDOIS.

(Waldenses,  
N. Italy.)

Perquë Diou ha tant vourgù bën ar mount, qu'a  
l ha dounà so Fill unic, perquë quiounquë crë en  
el perissë pà, mà qu'a l abbia la vita èternella.

## 42. MALTESE.

## 84. SYRIAC (Ancient).

هَجْدُكُمْ لِحَقِّ نَبِيِّكُمْ لَكُمْ : اِمْنُكُمْ وَبَعْدُ سُبْحَانَ يَدِك :  
وَجَدَ نَحْمُ وَنَحْمُ جِهَ كُيْ بَدَد : اِيْلَا يَسْمُو لِهَ سُبْحَانَ  
لَكُمْ .

ॐ नमो भगवते वासुदेवाय ॥ ॐ नमो भगवते वासुदेवाय ॥  
 ॐ नमो भगवते वासुदेवाय ॥ ॐ नमो भगवते वासुदेवाय ॥

## 86. PERSIAN.

زیرا که خدا آقدر جهان را دوست داشت  
که فرزند یگانه خود را از زانی فرمورتا که  
هر کس که بر او ایمان آورد هلاک نشود  
بلکه زنده گانی جاوید یابد

87. PERSIAN (Hebrew). (*Jews in Persia*.)

זירא כה כדא אן קדר נהאן רא דוסת דאשח  
כה פרזנד יכאנה' כוד רא ארזאני פרמוד כה  
תא הר כס כה בר או אימאן אורד הלך  
נשוד בלכח זנדגאני גאורד יאבד:

## 88. PUSHTOO, or Afghan.

څله چه خداي دنياله دارنك ميڼه كړي  
ده چه هغه خپل يوه پيدا شوي زوي لره  
ورکړه چه هر يوسري چه دهغه باند يقين  
کوي هغه دهلک نشي ليکن بي نهايته  
ژوندون دموي \*

## 89. SANSKRIT.

ईश्वर इत्थं जगददयत यत् स्वमद्वितीयं  
तनयं प्राददात् यतो यः कश्चित् तस्मिन्  
विश्वसिष्यति सोऽविनाश्यः सन् अनन्तायुः  
प्राप्स्यति ।

90. URDU, or Hindustani (*Arabic*).

کیونکہ خدا نے دنیا کو ایسا پیار کیا ہے کہ  
اُس نے اپنا اکلوتا بیٹا دے دیا تاکہ جو کوئی  
اُس پر ایمان لائے ہلاک نہ ہووے بلکہ  
حیات ابدی پاوے ۔

91. URDU (*Persian*).

کیونکہ خدا نے جہان کو ایسا پیار کیا ہے کہ  
اپنا اکلوتا بیٹا بخشا تاکہ جو کوئی اُس پر ایمان لائی  
ہلاک نہ ہوئی بلکہ ہمیشہ کی زندگی پائی

92. URDU (*Roman*).

Kyūuki Kḥudā ne jahān ko aisā piyār kiya  
hai, ki us ne apnā iklautā Betā bakhshā, tāki  
jo koī us par imān lāwe, halāk na howe balki  
hamesha kī zindagi pāwe.

## 93. BENGALI.

কেন্দ্রা বিশ্ব জগতের প্রতি এমন প্রেম করিলেন, যে আপনীর  
অক্লান্ত পুত্রকে দান করিলেন; যেন তাঁহাতে বিশ্বাসকারি  
প্রত্যেক জন বিনষ্ট না হয়ে অমৃত জীবন পায় ।

94. BENGALI (*Roman*).

Kenanā Ishwar jagater prati eman dayā  
karilen, je āpanār adwitya Putrake pradān  
karilen; tāhāte tānhār - bishwāskārī pratyek  
jan naṣṭa nā haiyā ananta paramāyu pāibe.

## 95. MUSSULMAN-BENGALI.

সব্ব্ব থেকে দুনিয়ার ভরফে অশ্রু মেঘের করিলেন, যে তিনি  
আপনীর একলোতা বেটাকে বর্শা করিলেন, অশ্রু যে কোন  
বর্শা তাহার উপরে হোয়ান আন সে হোনার না হয়ে বন্থকে  
হামেশার জৈবগি পাইতে পায় ।

## 96. SANTALI.

(Bengal.)

Nonká bāre āpe hon hoṛko samāngre marsāl  
guel ochoitāpe jemon unko hon āpā: bugi kāmī  
guelkāte āperen sermāren janāmi: ko sarhane.—  
(Matt. v. 16.)

## 97. MONDARI.

(Koles of Chota Nagpore.)

बिसवि परमेश्वर मोने लेका सेवतन होइ इनीगे संइगा हागा  
सोइो मिसो सोइो संइगा रंगा मेनेया ॥ (Mark iii. 35.)

## 98. LEPCHA.

ཨི་ཤཱ་འུ་ཨི་ཤཱ་འུ་ཨི་ཤཱ་འུ་ཨི་ཤཱ་འུ་ཨི་ཤཱ་འུ་

## 99. ORISSA.

ଘେହେରୁ ଗାହାଜୀରେ ପ୍ରଦେବ ଜଣ ଦୟାସଦାୟ ଘେହେରୁ  
ନଈ ନ ଘୋର ପରମାତ୍ମା ମାରକ ଶ୍ରେୟାତ୍ମକ ଗଣତରୁ  
ଏବେ ପ୍ରେମ କଲେ ଯେ ସେ ଆପଣା ପ୍ରଜାତ୍ମ ପୁତ୍ରକୁ ଦେଲେ

## 100. HINDI, or Hindui.

क्योंकि ईश्वरने जगतको ऐसा प्यार किया  
कि उसने अपना एकलौता पुत्र दिया कि  
जो कोई उसपर विश्वास करे सो नाश न  
होय परन्तु अनन्त जीवन पावे ।

## 101. H. NDI (Kaithi).

क्योंकि इश्वर ने जगत पर प्रेम की, जो उसने अपना  
एकलौता पुत्र दिया जो जो कोई उस पर विश्वास लावे सो  
नाश न होवे परन्तु अनन्त जीवन पावे ।

## 102. SINDHI (Arable). (Western India.)

جاکان ز خدء جهان کي اتر و پيارو رکيو  
 جو پنهنجو هڪڙوئي جڙيل پٽ ڏنائو  
 جيڪو ڪو تنه تي ويسا اُڀي سو چت  
 نه ٿي و پتر هميشه جڙيل لهي

## 103. SINDHI (Gurumukhi).

ਭਾ ਖਾਂ ਤਈਸ੍ਰ ਜਗਤ ਖੇ ਇਹੜੇ ਪਿਆਰੇ ਰਖੇ ਜੇ ਪਰਜੇ  
 ਹਿਰਿਜੇ ਈ ਜਕਾਲ ਪੁਤ੍ਰ ਤਿਨਾਈ ਤ ਜੇਰੇ ਕੇ ਤਨਿ ਤੇ ਵੇਸਾਹੁ  
 ਆਕੇ ਮੇ ਨਾਸੁ ਨ ਬਿਏ ਵੇਤਹਿ ਸਦਾ ਜਿਅਨੁ ਲਹੇ ॥

## 104. MOULTAN, or Wuch, or Ooch.

ਅਮਰਾ ੬੪੨੦੦ ੩੦੦੦੦ ੫੬ ੩੬ ੫੫੪ ੨੩ ੨੦ ੫੦੦੦  
 ੫੫੫ ੫੨ ੫੫੫ ੫੦੦੦ ੫੩ ੨੬ ੩੦ ੫੬੫੨ ੫੦੦੦੦ ੫੬  
 ੩੩ ੫੬੫੩ ੨੪੨੫੦ ੫੬ ੨੫ ੩੦੦੦ ੫੬ ੫੬ ੩੬੫੦ ੫੬੫

## 105. PUNJABI, or Sikh.

ਕਿਉਂਕਿ ਪਰਮੇਸਰ ਨੈ ਜਗਤ ਨੂੰ ਅਜਿਹਾ  
 ਪਿਆਰ ਕੀਤਾ, ਜੇਉਸ ਨੈ ਆਪਲ  
 ਇਕਲੋਤਾ ਪੁਤ੍ਰ ਦਿੱਤਾ; ਤਾਂ ਤਰੇਖ ਜੇ ਉਸ  
 ਪੁਰ ਪਰੀਖ, ਤਿਸ ਨਾ ਨਾਮ ਨਾ ਹੋਵੇ, ਸਗਲਾਂ  
 ਸਦੀਪਕ ਜੀਉਲ ਖਾਵੇ ।

## 106. GONDI. (Central India.)

ਯਾਹੁਨੇ ਸੀਬਾ ਰਜਾਰੇ ਯਾਦਸੀਖੋਨਾ ਸੁਭੇ ਬਗਭੇ ਸਾਧੀ ਭੇਦਨ ਲਿਖ  
 ਕਿ ਥੋਭੇ ਸੀਬਾ ਮੁਲੋ ਭਾਸਰੇ ਹੁਥੀਤੁਨ ਸੀਬਾਰ ਬਾਗੀਬੀ ਦਾਦਨਾ  
 ਸੁਧਾਨੁਬਾਦ ਯੋਰ ॥

(Matt. v. 16.)

## 107. NEPALESE, or Parbutti.

ਯਾਹਾ ਭੀਬਰੇ ਦੁਨਿਧਾਤਾਏ ਏਯੋਂ ਪਿਧਾਰੋ ਗਯਾ ਕਿ ਤਸਲ ਬਾਧਨਾ  
 ਏਕੁਪੈਦਾ ਯੋਰਲਾਏ ਦਿਧੋ ਕਿ ਜੋ ਹਰੇਕ ਯਾਨਿਸ ਤਸਮਾਧੀ ਪਿਧਾਸ  
 ਗਏਯਨੁ ਥੋ ਨਾਧ ਨ ਹੋਤਨ ਰਰ ਬਯਨਿਨਿਧੀ ਧਾਤਨ ।

## 108. TELUGU. (S. E. India.)

BIBLE HOUSE, NEW YORK CITY. The noble edifice, shown in the accompanying illustration, stands by itself on an open square, bounded by Astor Place, Fourth Avenue, Ninth Street, and Third Avenue, New York city; it covers an area of about three-quarters of an acre, and has a circumference of over seven hundred feet. In the view here given, the shaded, or right front, is on Astor Place; the left, or light front, is on Fourth Avenue. The building is of brick, with freestone copings, and, without being in any way extravagant in

BIBLE HOUSE, NEW YORK.

architectural embellishment, it commands attention by its magnitude, its admirable proportions, and its chaste and attractive finish. No part of the money needed to meet the large cost of the site and of the edifice was drawn from the contributions made for the support of the general work of the society. Generous subscriptions were made to the building fund by friends of the cause, and the balance of indebtedness was early met by the receipts from the rent of such portions of the building as were not needed for the use of the business of the society. The entire edifice is a monument to the liberality of all who contributed toward its erection.

BIBLIA PAUPERUM, or BIBLE OF THE POOR, was a sort of picture book of the Middle Ages, giv-

ing the leading events of human salvation through Christ, each picture being accompanied by an illustrative text in Latin. See *Britannica*, Vol. III, p. 653. A similar work on a more extended scale, with the text in rhyme, was called *Speculum Humane Salvationis*, or *Mirror of Human Salvation*. Before the Reformation these two books were the chief text-books used, especially by monks, in preaching. Many manuscripts are preserved in different languages, several as old as the 13th century. The pictures were copied in sculptures, altar-pieces, etc. The chief proof for the invention of printing by Koster in Haarlem rests on the first impressions of the *Speculum Humane Salvationis*.

BIBLE SOCIETIES OF THE WORLD. The following is a compendium of different Bible Societies of the world, compiled from the lists reported to the American and British and Foreign Bible Societies to Jan. 1, 1891. It shows the dates of organization and the total number of copies of the Scriptures issued severally by the various societies so far as reported up to March 31, 1890. The circulation reported by the British and Foreign Bible Society includes the issues by the various Bible Societies of India, amounting to a total from those societies of 8,534,533 copies:

| Imperial Russian Bible Society, at St. Petersburg, 1868     | 1,223,011     |

The British and Foreign Bible Society reported March 31, 1890, a list of 3,279 auxiliary and branch Bible societies; the American Bible Society at the same reported a list of 2,034, aggregating a total of 5,313 auxiliary and branch societies which are connected with those two parent societies, and whose names are not given in the foregoing list. The number of branch and auxiliary societies connected with other parent organizations cannot be given, as some of them have published no recent statistical reports. The Russian Bible Society, previous to its suspension by imperial ukase in 1826, had 289 auxiliaries. As most of the auxiliaries embraced in the figures given above report subordinate societies representing smaller territorial districts, it is estimated that the number of distinctive Bible organizations, including auxiliaries, in the world probably exceeds 10,000.

**BIBLIOMANCY**, a mode of divination much practiced during many ages by opening the Bible and observing the first passage that occurred, or by taking notice of the first words of the Bible heard after entering a place of worship. The application was often very fanciful. Prayer and fasting were sometimes used as a preparation for a mode of consulting the Divine oracles, than which nothing could be more contrary to their purpose and spirit, and which was in harmony only with the notions and practices of heathenism. It was prohibited under pain of excommunication by the Council of Vannes, A. D. 465, and by the Councils of Agde and Orleans in the next century. It continued, however, to prevail many centuries after, and was introduced into England at the Norman Conquest. It was essentially the same as the *Sortes Virgilianæ*, the only difference being the book employed.

**BIBLIOMANIA** (from Gr. *biblion*, "a book," and *mania*, "madness") may be defined as a passion for collecting and hoarding rare or curious books. The

last century and a half has witnessed a marked manifestation of this taste both in Europe and in the United States. The bibliomaniac values books, not alone for their intrinsic worth, but for their scarcity, their age, their binding, and even for some grave blemish. Even a very common book takes on a fictitious value in the collector's eyes if it be the only known copy in existence, or he printed in black letter, or have the stamp affixed of some long dead but famous binder. The formation of complete sets of such books, or of the works of a single author, provided they be rare, is a favorite pursuit with many. The editions of the classic writers most affected by collectors are the beautiful *Elzevirs* and the *Paulises*. Some of these have, at various times, brought fabulous prices. As much as £3,900 has been paid for a Mazarin Bible, and the first dated copy of Boecaccio's *Decameron*, 1471, was sold for £2,260. A psalter, printed by Fust and Schöffer in 1459, fetched £4,950 at a sale in London in 1885. A copy of the Guttenberg Bible in two volumes, printed in 1455, the first book printed from movable type, was purchased at the Brayton Ives sale in New York, March 14, 1891, by J. W. Ellsworth, of Chicago, for \$14,800. Such books as these are valued solely on account of their antiquity; works of a later date are prized on account of their beauty or fine workmanship. See *Britannica*, Vol. III, pp. 651, 655.

**BICARBONATES** differ from carbonates in containing twice as much carbonic acid. Bicarburets, bisulphurets and bitartrates are words formed on the same plan; but in recent chemical nomenclature the prefix *bi-* has been superseded by *di-*.

**BICE**, the name of two pigments, of a blue and green color respectively, known to artists from the earliest times. Both are native carbonates of copper, but are also prepared artificially. In its native state, however, bice is more durable, and in the case of green is especially much more brilliant. Artificial blue bice is known as Hambro blue, mineral blue, etc.; artificial green bice, as mountain green, Paul Veronese green and emerald green.

**BICEPS**, the muscle which gives a full appearance to the front of the arm. Above it consists of two portions or heads—whence its name—one being attached to the coracoid process of the scapula, the other to the margin of the depression on that bone which lodges the head of the humerus. The former is the short, the latter the long, head of the biceps. They unite to form a fleshy belly, which terminates in a rounded tendon. The biceps tendon is inserted into the tubercle of the radius. Before passing to this insertion it gives off an expansion, which separates the medium basilic vein from the brachial artery in the situation generally selected for venesection. The action of the biceps is rapidly to bend the forearm and also to supinate the hand.

**BICESTER**, a market town of Oxfordshire, England, 12 miles northeast of Oxford. There are manufactories of rope, clothing, sacking and pale ale, and several important fairs are annually held here. The ruins of *Alia Castra*, or Leicester, lie  $1\frac{1}{2}$  miles to the southwest, on the ancient Roman Akeman Street. Population, 3,300.

**BICETRE**, originally the name of a very old castle, in the neighborhood of Paris, commanding one of the finest views of the city, the Seine, and the environs. It was destroyed in 1632, because it had become the hiding place of thieves. It was rebuilt by Louis XIII, and made a hospital for old soldiers. Afterwards it served as a prison for 2,000 culprits, mostly condemned to the galleys, as well as a hospital for incurable lunatics. Wool-spinning and glass-polishing are carried on in the building.

**BICKERSTAFF, ISAAC**, an author of numerous comedies and light musical pieces, which had at one time a great popularity. He was born in Ireland in 1735. He became page to Lord Chesterfield and was afterwards an officer of marines, but was dismissed. Nothing is certainly known regarding his after life. His best known pieces are *The Maid of the Mill*; *The Padlock*; *He Would if He Could*; *Love in a Village*; *The Hypocrite*, and *The Captive*.

**BICYCLE**. Besides the ordinary bicycle described in Britannica, Vol. III, p. 665, consisting of a large wheel followed by a small one, several varieties have been introduced, the general purpose of which is the rider's safety. In one of these the wheels are reversed, the motive power being transmitted to the large wheel by levers and the small front wheel being used for steering. Others have smaller driving-wheels than usual, and are therefore lower, and the motive power is transmitted from pedal-levers to the axle by endless chains or secondary cranks.

The introduction of the pneumatic tire in 1890 resulted in a marvelous improvement in speed at both short and long distances, whether on path, road or grass. This is a large, hollow, India-rubber tire filled with compressed air. A modification of this, known as the cushion, also adopted in 1890, is a strong, hollow, India-rubber tire several times larger in diameter than the usual solid tire.

The present record, 1891, for one hour, is 22 miles, 620 yards; for two hours, 41 miles, 1,180 yards; for three hours, 60 miles, 1,255 yards. The following are the present best records for given distances:

|                           |                                    |
|---------------------------|------------------------------------|
| Miles $\frac{1}{4}$ ..... | Hr. 0 Min. 0 Sec. 31 $\frac{1}{2}$ |
| Miles $\frac{1}{2}$ ..... | Hr. 0 Min. 1 Sec. 8                |
| Miles 1 .....             | Hr. 0 Min. 2 Sec. 20               |
| Miles 2 .....             | Hr. 0 Min. 4 Sec. 59               |
| Miles 3 .....             | Hr. 0 Min. 7 Sec. 38               |

| Miles 100 .....           | Hr. 5 Min. 50 Sec. 5               |

**BIDA, ALEXANDRE**, an eminent French artist, born at Toulouse in 1823. He was a pupil of Delacroix. He became a member of the Legion of Honor in 1855, and an officer of the Legion in 1870. Among his principal works are a series of designs, in two volumes, illustrating the Evangelists, and a water-color painting, *The Massacre of the Mamelukes*, the property of the Metropolitan Museum of Art, New York.

**BIDAR**, a town in the Nizam's dominions, situated near the right bank of the Manjera, a tributary of the Godavery, 75 miles northwest of Hyderabad. Formerly a place of importance, it is now remarkable chiefly for its manufactures in a compound metal made of tin, copper, lead and zinc, and called bidderyware. This industry has been of late declining. The district of Bidar has an area of 4,881 square miles, and a population of 80,000.

**BIDASON**, a river which, rising in Spain, forms the boundary between Spain and France and falls into the Bay of Biscay, at Fuenterrabia. The treaty of the Pyrenees was concluded on an island in its mouth in 1659.

**BIDDEFORD**, a city of Maine, in the county of York, situated at Saco Falls, on the Saco River, six miles from the ocean. The city has an abundant supply of pure water, is well lighted with gas and electricity, has an electric fire alarm and street railways, and excellent schools. The high school building, erected in 1888 at a cost of \$50,000, is one

of the best in the State. Superior granite is found in the vicinity in inexhaustible quantities. The Lincoln Monument, at Springfield, Ill., is built of this granite. Biddeford was first settled in 1616, incorporated as a town in 1718, and as a city in 1855. Population in 1890, 14,418.

**BIDDING—PRAYER**, a form of exhortation, always concluding with the Lord's Prayer, enjoined by the 55th canon of the Anglican church in 1603, to be used before all sermons and homilies. Except in cathedrals and the university churches, it is now seldom used. The term is from the Anglo-Saxon *biddan*, "to pray," so that bidding-prayer is really pleonastic; but after the 16th century the word *bidding* came to be popularly regarded as an adjective, or *bidding-prayer* as a compound; a prayer which directs what is to be prayed for. The form is of extreme antiquity, and was anciently used for the communicants or believers after the dismissal of the catechumens, and was pronounced by the deacon, each petition beginning with the words, "Let us pray for," etc.

**BIDDLE, CLEMENT**, "Quaker soldier," born in Philadelphia, May 10, 1740, died there July 14, 1814. His parents were Quakers, and he was brought up with much strictness. Mr. Biddle, at the head of a company of Quakers and others, repelled a force of desperadoes in 1764, and from that time was active in all military actions of the day. He was a soldier of the Revolutionary War, and present at the battles of Princeton, Germantown, Brandywine and Monmouth. After the war he held important public offices. He was a personal friend of General Washington.

**BIDDLE, JAMES**, born at Philadelphia in 1783, died there Oct. 1, 1848. He entered the navy and saw service on board the *Philadelphia* and *Wasp*, and was commander of the captured *Frolic*. He was made prisoner near Tripoli, while on board the wrecked *Philadelphia*, and just after receiving command of the *Frolic*, the ship and crew fell into British hands. On being exchanged Captain Biddle's rank was raised and he was given command of the *Hornet*. He captured the *Penguin*, and then sailed for the Cape of Good Hope. He had a narrow escape from a British ship of war, which followed so closely that he had to throw his guns overboard. On returning to New York many honors were bestowed on him for his fine seamanship and gallant conduct. Subsequently he saw much active service, commanding the Mediterranean squadron in 1831, and in 1845 the East India squadron, which sailed to China to make a treaty with that country.

**BIDDLE, NICHOLAS**, born at Philadelphia, Sept. 10, 1750, killed in action, March 7, 1778. At the age of thirteen he made a voyage to the West Indies. In 1770 he entered the British navy, but deserted his ship three years later to go with Captain Phipps on an Arctic expedition. On his return he had gained sufficient experience to fit him for the command of a vessel and he was placed in charge of the *Andrea Doria*. From this time to his death Captain Biddle was extremely fortunate in his engagements with British ships. He captured two cruisers off Montauk Point, two transports and several merchantmen near Newfoundland, and four ships near Charleston, South Carolina. On March 7, 1778, while cruising in this vicinity with a fleet of five vessels (his own being the *Randolph*), he fell in with the *Yarmouth*, a heavily armed British vessel. In the action which ensued the *Yarmouth* sustained severe injuries and the *Randolph* was blown up and most of the crew perished. Captain Biddle's death was a great loss to the navy of the young Republic.

**BIDDLE, NICHOLAS**, financier, and descendant of a famous family several of whose members took

part in the Revolutionary War. He was born at Philadelphia, Jan. 8, 1786, died there, Feb. 27, 1844. He was a precocious youth, and could have graduated at the University of Pennsylvania at the age of thirteen. He graduated from Princeton in 1801, standing at the head of his class. He went abroad as secretary to John Armstrong, minister to France; was directed to audit and pay claims against the nation, using the purchase-money of Louisiana; was secretary for Mr. Monroe when he went as minister to Great Britain. In 1807 he returned home and practiced law, giving his leisure to literary pursuits. He was assistant editor of the "Portfolio," and prepared the report of Lewis and Clark's expedition to the mouth of the Columbia River from their notes. In the legislature to which he was elected in 1810 he originated an educational bill which was so far in advance of the times that it could not be passed till 1836, when a bill similar to it was carried through the legislature. Mr. Biddle was largely influential in rechartering the United States bank. He was appointed a government director, and later president of the bank. In 1829 President Jackson's war on this institution undermined its credit, and a financial panic ensued, which all the efforts of Mr. Biddle were unavailing to ward off. He resigned the presidency in 1839, and the following year the bank failed. Mr. Biddle was a man of great and varied talents, and one who commanded the confidence of all who knew him.

**BIEBRICH**, a town on the right bank of the Rhine,  $2\frac{1}{2}$  miles south of Wiesbaden. It has the castle of the dukes of Nassau, and several factories. Population, 10,000.

**BIELA**, WILHELM, BARON VON, a German astronomer, born at Rosla, Prussia, in 1782, died in 1856. He discovered the comet known as Biela's comet. See *Britannica*, Vol. VI, p. 192; Vol. XVI, p. 111.

**BIELO-OZERO** ("white-lake"), a lake in the government of Novgorod, Russia. It doubtless receives its name from the milky appearance given to its water in stormy weather by the white clay of which its bed is composed.

**BIELSHÖHLE**, a singular cavern in one of the Harz Mountains, called Bielstein, on the right bank of the Bode, in the duchy of Brunswick, Germany. It was discovered in 1768. The entrance to it is more than 100 feet above the bed of the stream. The cavern is divided into eleven main compartments, and contains a great deal of that curiously freakish work which Nature delights to execute, stalactites.

**BIELSK**, a town of Russian Poland, 25 miles south of Białystok. It is situated in a very fertile district watered by the Narew and Nurzek. It is well built, and has a fine custom-house. Population, 10,000.

**BIENNE LAKE**, a body of water 10 miles long by from 1 to 3 wide, situated in Berne near the foot of the Jura Mountains. It is famous for inclosing the island St. Pierre, where J. J. Rousseau lived in 1765. In the southeastern part of the lake, the submerged, pre-historic remains of a village of lake-dwellers have been found.

**BIELZY**, a manufacturing town of Russia, about 150 miles northwest of Odessa. It is noted for an annual fair, which is held here.

**BIENNIALS**, plants which do not blossom the first season of their growth, but flower and bear fruit in the second season, and then die. Plants which in ordinary circumstances are biennials, often become annuals when early sowing, warm weather, or other causes promote the earlier development of a flowering stem. If, on the other hand, the flowering of the plant is prevented, or in many cases, if it is merely prevented from ripening its seed it will continue to live for a much longer pe-

riod; as, for instance, a bed of parsley, if regularly cut, will remain productive for a number of years.

**BIENVILLE**, JEAN BAPTISTE DE, born in Montreal in 1680, died in 1768. With his brother, Lemoine d'Iberville, he undertook an expedition in 1699, to the mouth of the Mississippi. He was the founder of the city of New Orleans, and was three times appointed governor of Louisiana.

**BIERSTADT**, ALBERT, born in Düsseldorf, Germany, Jan. 7, 1830. His taste for art was early shown, as he made excellent crayon sketches in his youth, and at the age of 20 had begun work in oils. Three years later he went from New Bedford, Mass., where he had been brought up, to his birthplace, spending four years in the study of art, and then going to Rome to further prosecute his studies. In 1857 he returned to America, making an extensive tour through the West, where he obtained material for many subsequent paintings. He has three times visited Europe, and has had many honors conferred upon him both at home and abroad. Bierstadt is famous for his pictures of mountain scenery. *Laramie Peak, Looking Down the Yosemite Valley of the Yosemite, In the Rocky Mountains, and California Oaks*, are among his best-known works.

**BIERVLIET**, a village of the Netherlands, province of Zeeland, 73 miles east-northeast of Sluis. It was the birthplace of William Beukels, who, in 1386, invented the method of curing herrings. In 1377 Biervliet was detached from the mainland by an inundation and still remains insular.

**BIES-BOSCH**, a marshy sheet of water of the Netherlands, between the provinces North Brabant and South Holland, formed in November, 1421, by an inundation which destroyed 72 villages and 100,000 people, and forming that part of the estuary of the Maas called Holland's Diep.

**BIGA**, a Roman term applied in ancient times to vehicles drawn by two horses abreast. In shape it resembled the Greek war-chariot—a short body on two wheels, low and open behind, where the charioteer entered, but higher and closed in front.

**BIGAMY**. See *Britannica*, Vol. III., pp. 668-69. In the United States, the principal points of difference between the laws of the various individual States are, as to whether the offense is indictable in the State in which the ceremony of marriage takes place or in that in which the bigamous parties actually cohabit, and, further, as to whether a ceremonial marriage must be established at all. Otherwise, the general principles of the common law holds good either by usage or by statutory enactment, in all the States alike.

**BIG BETHEL**, a locality in Virginia, about 10 miles northwest of Fortress Monroe. It was the scene of an engagement, June 10, 1861, in which a body of Union troops, being sent by General Butler to dislodge a detachment of Confederates commanded by General Magruder, were repulsed with considerable loss.

**BIG BLACK RIVER**, an affluent of the Mississippi, which it enters at Grand Gulf. It is about 200 miles in length, and is navigable for about 50 miles. Its banks were the scene of important military operations in connection with the taking of Vicksburg in 1863. At a bridge crossing the river about 15 miles east of that city, the Union forces under General Grant carried the works of the Confederates under General Pemberton, May 17, capturing all on the east side and driving those on the west bank to their final retreat within the defenses of Vicksburg.

**BIG BONE LICK**, a saline spring of Kentucky, about 12 miles south of Burlington. It is noted for the numerous bones found here of the mastodon and other extinct animals, which are believed to

have come to "lick" the salt and to have perished in the then marshy soil.

BIGELOW, ERASTUS BRIGHAM, born at West Boylston, Mass., April 2, 1814, died at Boston, Dec. 6, 1879. His father, a cotton weaver, intended he should study medicine, but Erastus turned his attention to invention. In this field, toward which he had a peculiar bent, he was successful. Some of his inventions were a hand-loom for suspender-webbing, an automatic loom for weaving fine counterpanes, a loom for weaving coach-lace, and power looms for the weaving of two-ply ingrain carpets, tapestry and tapestry velvet carpets. He did much to further the prosperity of Clinton, Mass., was a writer on the protective tariff, author of a work on stenography, and a member of the Boston Historical Society.

BIGELOW, JACOB, born at Sudbury, Mass., Feb. 27, 1787, died at Boston, Jan. 10, 1879. He was a Harvard graduate and a physician of Boston. Being a famous botanist, he was chosen as one of a committee of five to form the American Pharmacopœia. He had an extensive correspondence with scientific men of Europe, several of whom named plants for him. For 20 years he was physician of the Massachusetts General Hospital, for 40 years professor of *materia medica* in Harvard, and from 1816 to 1827 held the Rumford professorship in the college. For many years he was president of the Massachusetts Medical Society and of the American Academy of Arts and Sciences. Dr. Bigelow was interested in educational work, and labored for the establishment of technical schools. He contributed articles for magazines, and wrote several books, some of which were: *Florida Bostoniensis*, *Elements of Technology*, *History of Mount Auburn* (he was the founder of this cemetery), and *Nature in Disease*.

BIGELOW, JOHN, journalist, born at Malden, N. Y., Nov. 25, 1817. He was a graduate of Union College and practiced law in New York. He left the law and entered journalism. He edited "The Plebeian" and the "Democratic Review;" was inspector of Sing Sing prison; partner with William Cullen Bryant in the "Evening Post;" minister to France (1865-67); secretary of the State of New York (1867-68); made an honorary member of the New York Chamber of Commerce (1886); and trustee of Samuel J. Tilden's estate.

BIGG, or BIG BARLEY, a local name for a kind of winter barley grown in Northern Europe, especially in Scotland. It is the common here, or four-rowed barley, *Hordeum vulgare*.

BIGGAR, a town of Lanarkshire, situated 28 miles southwest of Edinburgh, with which it has connection by rail. The Collegiate Church of St. Mary was founded in 1545; of Boghall Castle, the seat of the great Fleming family, hardly a vestige remains. Dr. John Brown, author of *Rab and His Friends*, was born in the United Presbyterian manse; and John Gladstones (1693-1756), great-grandson of W. E. Gladstone, is buried in the churchyard. Population, 1,556.

BIGGLESWADE, a market-town at Bedfordshire, 41 miles northwest of London by rail. It is a great corn market. Population, 4,947.

BIG HORN, a navigable river of the United States, and the largest affluent of the Yellowstone, rises near Fremont's Peak in the Rocky Mountains, in the northwest of Wyoming, and has a course of about 350 miles.

BIGHT, in nautical language, the bent or doubled part of a rope. Thus one anchor may "hook the bight" of the cable of another, and thereby cause entanglement. In geography bight has much the same sense as "bay."

BIGNONIA, a genus of American tropical and sub-tropical plants, typifying the natural order

*Bignoniaceæ*. It includes many very handsome climbers which bear a beautiful bell-shaped flower—notably the gorgeous trumpet flower, *Tecoma radicans*, or *Bignonia radicans* of the United States.

BIGNONIACEÆ, a natural order of exogenous plants, generally with compound leaves. The flowers are showy, and are among the most striking ornaments of tropical forests. The corolla is of one petal more or less trumpet-shaped and irregular, the stamens are five in number and unequal, the ovary is free, seated on a disk, one to two-celled, the fruit sometimes capsular sometimes drupaceous. There are about 500 known species; in many cases noble trees, and some of them afford valuable timber. The fleshy sweet root of *Craniolaria annua* is preserved in sugar as a delicacy by the Creoles.

BIGORRE, a mountainous district in the southwestern part of France, formerly belonging to Gascony, but now for the most part embraced in the department of Hautes-Pyrenees. Tarbes has been the chief town since the days of the Romans.

BIG RAPIDS, a city of Mich., county-seat of Mecosta county. It is situated on the Muskegon River, about fifty-five miles north of Grand Rapids. It is a very important lumber market, and has an extensive water-power and numerous manufactories of shingles, lumber, and furniture, besides a number of mills, foundries, and machine-shops.

BIG SANDY RIVER, also called CHATTERAWAH, a navigable affluent of the Ohio, formed by the junction of two branches which rise in Virginia. The west fork traverses several counties of Kentucky, and the east fork is, during the latter part of its course, the boundary between the two States.

BIHACH, one of the strongest fortress towns of Croatia, European Turkey, situated on an island in the Una, near the frontier of Dalmatia. It has been the scene of frequent contests during the Turkish wars. Population, 3,000.

BIHAR, a county of Hungary, with an area of 4,279 square miles. It is mountainous in the east, and has barren heaths and marshes in the west. The western part has many small rivers. Wheat, wine and tobacco are largely produced.

BIHE, a fruitful district of South Africa, east of Benguela, and under Portuguese influence. The eastern part rises to a lofty plateau, where the climate is delightful. Bihe is an important caravan center, as the only route across the continent south of the Congo passes through it. The trade is chiefly in slaves and ivory. Area, 2,500 square miles. Population, 95,000.

BIJAWAR, a petty native state in the Bundelkhand Agency, with an area of 971 square miles. Diamonds and ironstone are found. The country is poor and hilly. Population, 113,285.

BIJEABAR, next to the capital the largest town of Cashmere, situated on the banks of the Jailum, about 25 miles to the southeast of the metropolis, in latitude 33° 47' north and longitude 75° 13' east. A feature worthy of notice is a wooden bridge across the Jailum which, notwithstanding its simplicity and fragility, has endured for centuries.

BIJBHARU, or BIJBANAR, a town in Kashmir state, India, on the Jhelum, 25 miles southeast of Serinagar. It is the second city in the state.

BIKH, the name given by the natives of India to a poison derived from the roots of *Aconitum ferax*, a species of aconite.

BILANDER, a small two-masted merchant vessel, distinguished from others chiefly by a peculiar shape and arrangement of the main-sail. Of these vessels, which were probably of French origin, there are few remaining.

BILBERRY, a shrub and its fruit, *Vaccinium myrtillus*, the European whortleberry. In Scotland

the bilberry is called *blackberry*, from its *blue* or dark-blue color.

**BILBILIS**, an old Iberian city of Spain, two miles east from Calatayud, in the province of Saragossa, celebrated as the birthplace of the poet Martial; also famed for its highly-tempered steel blades. Under the Romans it was a municipal town with the surname Augusta.

**BILBOES**, long bars or bolts of iron with shackles sliding on them and a lock at one end. When an offender on ship board is "put in irons," it implies that bilboes are fastened to him more or less ponderous according to the degree of his offense. The bilboes clasp the ankles as the handcuffs clasp the wrists.

**BILGE**, the part of the bottom of a ship nearest the keel, and always more nearly horizontal than vertical. A ship usually rests on the keel and one bilge when aground. The name *BILGE-WATER* is given to rain or sea-water which trickles down to the bilge, and which, being difficult of access, becomes dirty and offensive.

**BILHARZIA** (*Distomum*), a parasitic flat worm in the fluke or Trematode order, and belonging either to the same genus as the common liver-fluke, *Distomum hepaticum*, or to one very closely related. In all other Trematodes the sexes are united, the animals are hermaphrodite, but here, the male being the larger, retains the female in a grooved canal, formed by an involution of the edges of the concave side of the body. Pairs thus united are found in the blood-vessels of man, especially in the urinary organs, the ova escaping through an ulceration caused by the presence of the parent. They occur from Egypt southwards to the Cape. It is said that about half of the Fellah and Copt population of Egypt suffer from this parasite. It was named after Theodore Bilharz, an old helminthologist. See *Britannica*, Vol. XXIII, p. 540.

**BILIN**, a town of Bohemia, beautifully situated in the valley of the Bila, and famous for its mineral springs, the waters of which it exports to the extent of 500,000 jars annually. It has two castles, and in its vicinity there is a remarkable isolated clinkstone rock, called Biliner Stein, and the Tripoli earth found at Bilin has been shown to be the remains of infusoria. It has manufactories of cotton-yarn. Population, 3,000.

**BILL**, or *GISARME*, a weapon of warfare used in England and on the Continent before the introduction of firearms. It was a kind of battle-axe having a blade shaped somewhat like a sickle, to which a drawing movement was given in striking.

**BILL**, or *BEAK*. See *Britannica*, Vol. III, pp. 699-717.

**BILLARDIERA**, or *Applebury*, a genus of shrubs of the natural order *Pittosporaceæ*. They have simple alternate evergreen leaves, and axillary pendulous flowers. The flowers have a calyx of five sepals, and a bell-shaped corolla of five petals. The fruit is a soft spongy pericarp with inflated cells. It is edible, although not destitute of a resinous character, which prevails in the order. It is a native of Australia.

**BILLINGS**, an important city of Montana, county-seat of Yellowstone county, situated on the north bank of the Yellowstone River, about sixty miles above the mouth of the Big Horn. It is an important wool-market, and the shipping-point for the stock-ranges of the surrounding country. Artificial irrigation is rapidly extending the area of cultivated land in the vicinity.

**BILL-BROKERS**, persons who, being skilled in matters pertaining to the money-market, engage, either on their own account or that of their employers, in the purchase and sale of foreign

and inland bills of exchange, and promissory notes.

**BILL-CHAMBER**, a department of the court of sessions in Scotland which deals with all matters of a summary nature, and generally all cases requiring the immediate interposition of judicial authority for arrestment of funds or inhabitation of heritable property, for stay or suspension of diligence or execution. Since 1813 the bill-chamber is presided over by a single judge, called the lord ordinary on the bills, and during the sittings of the court of sessions the position is occupied by the last-appointed judge of the court; but in vacation the bill-chamber exercises many of the powers of the court of sessions, and is presided over by a rotation of judges.

**BILLET**, in architecture, an ornament belonging to the Norman style, much used in early mediæval work, resembling a billet of wood, or a small section of round molding, of which a series were placed at regular intervals in or upon a molding. When used in several rows the billets were placed alternately.

**BILLET**, in heraldry, a bearing in the form of a small rectangle, represented flat without shadow or relief. A field or charge strewn with an indefinite number of billets is called *billety* or *billettee*.

**BILL IN EQUITY**, a statement of a plaintiff's case in a suit in equity. It is said to be an original bill if it initiates the suit, and a bill not original if used for the purpose of controverting, suspending, or revising a proceeding, or for cross-litigation.

**BILLINGS**, a small railroad town of Christian county, Mo., distant 261 miles from St. Louis. The Southwestern Christian College and the Christian Colony are located here. It has manufactories of flour, plows, and wagons.

**BILLINGS, JOSIE**. See *SHAW, HENRY W.*

**BILLINGSGATE**, a wharf and fish market a little below London Bridge. It was opened in 1558 as a landing place for provisions, and in 1699 was made a free and open market for all sorts of fish. It is the only wholesale fish market in London. The fishermen consign their cargoes to the dealers, who occupy stalls in the market, and these supply the retail dealers. An officer has the general superintendence of the market, and the quality of all fish offered for sale is tested by inspectors. See *Britannica*, Vol. XIV, p. 829.

**BILLINGTON, ELIZABETH**, a celebrated English singer, born in London in 1769, died in 1818. She was the daughter of a German musician named Weichsel. She early came forward as a performer on the piano and as a composer, and having married her music teacher, Thomas Billington, she appeared with brilliant success on the opera stage in Dublin in 1786. She perfected her musical education under Sacchini in Paris, who wrote for her his opera, *Inez de Castro*, while she was singing in Naples in 1794. She appeared subsequently in Venice and Rome, retiring from the stage in 1809.

**BILL OF ADVENTURE**, a writing by a merchant ship-owner or master to show that goods shipped by him on board a certain vessel are the property of another, whose *adventure* or chance the transaction is, he himself being responsible only for their delivery. Generally, in commercial law, an *adventure* may be said to be a speculation in goods shipped under the care of a *supercargo*, to be disposed of by him to the best advantage, for the benefit of his employers.

**BILL OF ATTAINDER**. See *Britannica*, Vol. III, p. 52; Vol. VIII, p. 330. In the United States the passage of any bill of attainder, by Congress or

by an individual State, is prohibited by the Constitution.

**BILL OF CREDIT**, a letter authorizing a third party to give credit to a second on account of the first. It is known as a special bill of credit if the third party is specifically addressed, and as a general bill if addressed indefinitely to any who may see fit to give the bearer the credit proposed. The term, as used by the Constitution of the United States, which prohibits the emitting of bills of credit by any State, is construed to mean paper issued by a State on its mere faith and credit to be circulated as legal tender.

**BILL OF EXCEPTIONS**, a statement of objections, by way of appeal, against the decision of a judge who is trying a case with a jury in the court of sessions. The objection may be that the judge has misdirected the jury in point of law, or has improperly rejected or admitted evidence. The phrase was, prior to the judicature act, also used in England in the same sense, but is now merged in the "motion for a new trial."

**BILL OF HEALTH**, a certificate, signed by a consul or other authority, delivered to the master of a ship at the time of clearing from a port or place suspected of being subject to infectious disorders, certifying the state of health at the time that such ship sailed. A *clean* bill imports that at the time the ship sailed no infectious disorder was known to exist. A *suspected* bill, commonly called a *touched* patent or bill, imports that there were rumors of an infectious disorder, but it had not yet appeared. A *foul* bill, or the absence of a clean bill, imports that the place was infected when the vessel sailed.

**BILL OF MORTALITY**, a return of the deaths within a certain district, specifying the diseases, and giving a progressive view of the age at death.

**BILL OF PAINS AND PENALTIES**. See *Britannica*, Vol. VIII, p. 365. The provision of the Constitution of the United States that no bill of attainder, nor any *ex post facto* law, shall be passed by Congress or by a State is held to include bills of pains and penalties.

**BILL OF RIGHTS**. The history of the English bill of rights, and its effect upon the constitutional history of this country, are narrated in *Britannica*, Vol. XX, p. 555. Many of its provisions have been inserted literally in the amendments to the Constitution of the United States, and are found in our State constitutions.

**BILL OF SIGHT**, an entry of imported goods of which the merchant does not know the quantity or quality. This is permitted to save time by the customs authorities on sworn information. The bill must be made perfect in three days by indorsing the particulars required for warehousing, payment of duty, or delivery free of duty. If the entry is not completed within a month the goods are sold.

**BILL OF STORES**, a list of necessary stores and provisions carried by merchant ships. It is made out by the master and countersigned by the collector of customs, the object being to prevent frauds on the revenue.

**BILLOM**, a town of France, in the department of Puy-de-Dôme, situated on a hill 14 miles east-south-east of Clermont. It is one of the most ancient towns of Auvergne, and was formerly surrounded by walls, which have now disappeared. In 1455 a university was founded at Billom, which passed into the hands of the Jesuits a century later, and was governed by them until the suppression of their order. It has manufactories of fine pottery. Population, 1,266.

**BILLOX**, an alloy of copper and silver, in which the copper predominates, and which is used in some

countries for the smaller denominations of money. See *Britannica*, Vol. XVII, p. 630.

**BILNEY**, THOMAS (c. 1495-1531), an English martyr, born about 1495, probably at Norwich. He studied at Trinity Hall, Cambridge, and was ordained in 1519. He was opposed to the formality of the schoolmen, and denounced saint and relic worship, converting a number of young Cambridge men to his views. In 1527 he was arraigned before Woolsey, and, recanting, was absolved, but was nevertheless confined in the Tower of London for more than a year. Some time after his release, being overcome with remorse for his faithlessness, he began to preach in the fields of Norfolk, but was soon apprehended and condemned; and, although allowed to receive the sacraments of the church, from which he really differed but little, he was burned as a heretic at Norwich, Aug. 19, 1531.

**BILONI**, a town of Mississippi, on the bay of the same name, situated in Harrison county. It has a railroad, a convent, an iron light-house, and is considered a pleasant summer resort.

**BIMA**, or *Bonjo*, a seaport in Sumbawa, one of the Sunda Isles, in latitude 8° 30' south, and longitude 119° east. It is on a bay of the north coast, being 100 miles to the east of Sumbawa, a town feudally dependent on its sultan. Its chief exports are horses and timber.

**BIMANA** (Latin, "two-handed"), a term first employed by the Gottingen anatomist Blumenbach (1752-1840) to describe the human species alone. The separate order thus designated was recognized by Cuvier and by most of his contemporaries and immediate successors. It has since been shown, however, that man differs less from the anthropoid apes than these apes do from most monkeys, and the term *Bimana* is now rarely used, man being included with apes, monkeys, and lemurs in the old Linnæan order, *Primates*. See *Britannica*, Vol. XV, p. 444.

**BIMETALLISM**, a term used to denote a double monetary standard of value as fixed by legislative enactment; specifically it is that system of coinage which recognizes either silver or gold coin as legal tender to any amount as a circulating medium and at a fixed relative value. It includes two essential features: (1) an open mint, ready to coin any quantity of either gold or silver which may be brought to it, and (2) the right on the part of the debtor to discharge his liabilities, at his option, in either of the two metals at the established legal ratio. It depends on the possibility of keeping the legal ratio between gold and silver in the bullion market the same. In the ancient world, the ratio of gold to silver in the bimetallic coinage established by Croesus, and existing down to the time of Alexander, was as 1 to 13.5. In modern times the market ratios have greatly changed in different countries and in different terms of years. In the year 1500 the relative market value of gold and silver was as 1 to 10.75; from 1621 to 1610 it changed to 1 to 14; then, until 1800, fluctuated between this latter value and 1 to 15.27; in 1876 it reached 1 to 17.77; in 1880 it was 1 to 18.06; in 1885 the ratio was 1 to 20.

An international monetary conference was held in Paris in 1878 for the purpose of establishing an international standard of value. A royal commission was appointed in 1886 in England to inquire into the "changes in the relative values of the precious metals," and this commission made its report in 1888. The report was reprinted by the United States Government in 1889. Another international monetary congress was held in Paris in 1889, and in 1890 the United States Congress passed an act empowering the United States Treasury to buy an aggregate amount of 4,500,000 oz. of silver a month, the

highest price paid to be not more than one dollar for 371.25 grains of pure silver, this being the American bimetallic par value at the time. In a few months the price rose 25 per cent. The United States had been hitherto steady exporters of the metal, but exportation received a check. It is possible, should the market value of silver reach the figure established by the above legislative action, that the United States may boldly adopt bimetalism in conjunction with the European nations that are members of the Latin Monetary Union.

**BIMBIA**, a district on the southern slope of the Cameroon Mountains in Africa, and on the northern bank of the river Bimbia. Since 1884 it has been part of the German protectorate.

**BINAB**, a town of Persia, in the province of Azerbijan, beautifully situated on the banks of the Sofi Chai, in the midst of orchards and vineyards, 55 miles south-southwest of Tabriz. The streets are very clean, many of them having a stream of pure water flowing down the center.

**B.NASCO**, a town of Lombardy, 11 miles northwest of Pavia. It is defended by a castle, where, in 1418, Beatrice di Tenda, wife of the Duke Filippo Maria, was beheaded by order of her husband.

**BIN-BIR-KILISA**, the name of extensive ruins in the pashalic of Karamania, Asia Minor, 20 miles north-northwest of Karama. The ruins consist chiefly of the remains of Byzantine churches, evidently of great antiquity, and some of considerable size. It is supposed to be the ancient Lystra, where the cripple was healed by St. Paul.

**BINCHE**, a town of Belgium, on the Haine, 10 miles from Mons. It is well built and walled, with a fine square, ornamented with a fountain. It has manufactories of leather, cutlery, glass, etc., and trade in lace, paper, marble and coal. Population, 5,500.

**BINDRABAN**, a town on the right bank of the Jumna, in the district of Muttra, 823 miles to the northwest of Calcutta, and 92 miles to the south of Delhi. Superstition seems to be the principal business of the place, crowds of pilgrims come from all parts of India, more particularly in honor of Krishna, and through the munificence of wealthy devotees sacred edifices are constantly becoming more numerous and costly. Here, as at Benares, the immediate margin of the river is occupied by flights of steps; these extend for about a mile along the bank, and are constructed of red stone brought from Jeypore, nearly 150 miles distant. Population, 21,550.

**BINGHAMTON**, a prosperous city of New York, county-seat of Broome county, situated on the north branch of the Susquehanna River, at the mouth of the Chenango River, on the Chenango canal, 215 miles northwest of New York. The city is supplied with water from the Susquehanna River by the Holley system. The court-house is a handsome edifice, modeled after St. Paul's in London, and contains a county law library. The New York State Asylum for Inebriates, having failed in the experiment of reforming inebriates, is now used as a State asylum for the chronic insane. The Binghamton Academy, a Roman Catholic academy, parochial school, the Susquehanna Valley Home, a refuge for orphan children, and St. Mary's Home for Indigent Children, are among the educational and charitable institutions. The city was founded by William Bingham in 1787, incorporated as a village in 1818, and became a city in 1867. Population in 1880, 17,317; in 1890, 35,093.

**BINNACLE**, a wooden box or case, containing a ship's compass together with other apparatus essential to its use. In large ships there are gen-

erally two binnacles, one for the steersman and one for the officer who superintends the steering.

**BINNEY**, HORACE, an eminent lawyer, born at Philadelphia, Pa., Jan. 4, 1789, died there Aug. 12, 1875. He was of English and Scotch descent, and his father had been an army surgeon. He was a Harvard graduate, who won high honors; studied law with Jared Ingersoll; was called to the bar at the age of twenty. In fifteen years he won all the fame and practice he could wish for. He had by this time prepared the volumes which contain the supreme court decisions of Pennsylvania. These volumes are highly esteemed. He was elected to the Twenty-third Congress, and there defended the United States bank. He declined reelection, and retired from active public life. He occasionally gave legal written opinions, and his last notable public services were in regard to the case between Bidal and Girard's executors. Mr. Binney was a famous student, remarkably fond of reading, while, as an orator, he was gifted with a melodious voice and dignified manners. He was a faultless logician, and a powerful advocate.

**BINOCULAR**, a field glass, opera glass, or microscope fitted for the simultaneous use of both eyes. See *Britannica*, Vol. XVI, p. 272.

**BINTURONG**, a genus of quadrupeds, nearly allied to raccoons, from which the chief distinction is in the smaller and less tuberculated back molar teeth. Only two species are known, natives of Malacca, Sumatra, Java, etc. See *Britannica*, Vol. XV, p. 436.

**BIOBIO**, the largest river of Chile. It has a west-northwest course from the Andes to Concepcion on the Pacific, being two miles wide at its mouth, and navigable for boats from the sea to the mountains. Its lower stream separates the province of Concepcion on the north from Independent Araucania on the south.

**BIOGENESIS**, the name used by Huxley for generation in an ordinary sense; the theory that living matter always arises by the agency of pre-existing living matter. Biogenesis is the converse of *abiogenesis*, spontaneous generation.

**BIOGRAPHY**, the representation in continuous narrative of the life and character of a particular individual. It may merely detail the historical sequence of the incidents of a man's life, or it may be an elaborate attempt at an analysis of his character, and at a complete reconstruction of the whole motives of his actions. To the former class mainly belong the ancient examples of biography, as the *Life of Agricola*, by his son-in-law, Tacitus, and the *Life* ascribed to Cornelius Nepos; while modern biographers have mostly aimed at the latter method. But as the inward life is revealed in the outward, so the most dignified and reticent biography must give some real insight into the character of the man. No little of the interest in ancient and modern histories alike depends on the pictures of men and women with which their pages are lighted up, and when the hasty sketches are by analysts like Livy and Tacitus, we get from them a truer impression than from the most finished biography by a writer of less insight. A biographer may not have the ability to see under the surface the hidden springs of character, and thus understand the relative significance of things, and in proportion as he is wanting in this insight he is liable to give an untrue picture of his subject. Especially is this danger close to him who has to deal with a time or a society in which he himself has not lived; while, in writing modern biographies, he is apt to err by not selecting merely the significant. Of strictly biographical works, the most valuable that has come to us from the ancient Greeks is the

*Lives of Plutarch*, and from Roman literature the *Agricola* of Tacitus. Besides these we have the *Lives of Cornelius Nepos*, the writings of Suetonius, the *Life of Alexander the Great*, by Curtius; *Lives of the Sophists*, by Philostratus, and a *Life of Plato*, by Olympiodorus. Later we have, in ecclesiastical literature, the *Lives of the Fathers*, by Saint Jerome, and numerous biographies of saints, martyrs, etc. In the French and German languages there are many excellent examples of biography. Here it may be enough to mention the names of the authors of those which are among the most valuable: In France, Flechier, Fontenelle, Voltaire, Boissy d'Anglas, Villemain, Cousin; and, in Germany, Schröckh, Herder, Klein, Meissner, Heeren, Luden, Varnhagen von Ense, Barthold, Döring, Pertz, Haym, Arneth, Otto Jahn, Chrysander, Kapp, and Droysen. Some excellent biographies that have been translated into English are Köstlin's *Luther*, Zeller's *Strauss*, Lomenie's *Bennett*, Duntzer's *Fichte*, Schiller and Lessing. Among English biographies may be specially mentioned Boswell's *Life of Johnson*; Lockhart's *Scott*; Moore's *Byron*; Morley's *Diderot and Rousseau*; Trevelyan's *Macaulay and Fox*; Theodore Martin's *Life of the Prince Consort*; Carlyle's *Frederick the Great*, his *Schiller*, and his *Letters and Speeches of Oliver Cromwell*; Lewes's *Goethe*; Talfourd's *Lamb*; Washington Irving's *Columbus*; Sparks's *Washington*; Helps's *Cortez*, and his *Pizarro*, and Froude's *Cæsar*. There are also many excellent universal biographies, such as Chalmers's *Biographical Dictionary*, *Men of the Time*; *Celebrities of the Century*, etc. Other biographical works treat of the lives of certain classes of men, as Vasari's *Lives of Painters, Sculptors and Architects*, and Agnes Strickland's *Lives of the Queens of England*. Others again are for certain countries only, as *Biography Britannica*, Sparks's *American Biography*, and Appleton's *Encyclopædia of American Biography*.

**BIOPLASM**, a term introduced by Professor Beale, about 1872, for the germinal matter of living beings as distinguished from formed matter; the state or condition of protoplasm in which it is living and germinating.

**BIPED** (Latin, "two-footed"), a descriptive term, sometimes applied to man, but more frequently to birds. It may be used in reference to habit only, as when animals use only their two hind-limbs for moving along the ground—e. g., man, kangaroo, bird; or it may be used in reference to anatomy, when the typical number of four limbs is reduced to two. Thus among mammals the order of whales (*Cetacea*) is marked by the absence of hind-limbs; among reptiles, some serpents retain traces of hind-legs, and a few lizards have either only hind-feet, or only fore-feet, among amphibians, a few have only fore-feet; and the same is true of numerous fishes and especially of those which live to a large extent in mud.

**BIPENNIS**, a double-headed axe, the weapon which, according to ancient historians and artists, particularly distinguished those fabulous female warriors, the Amazons.

**BIPINNARIA**, the technical name of a starfish larva. It is a curiously-shaped free-swimming form, with two ciliated bands, and with a tendency to develop long, stilt-like arms or processes. It does not directly turn into the adult, but is only its "nurse." The adult is formed within the bipinnaria.

**BIRCH, SAMUEL, LL.D.**, Egyptologist, born in London, Nov. 3, 1813, died there Dec. 27, 1885. He was educated at Merchant Tailors' in 1834, and entered the public service under the commissioners of public records, and in 1836 became assistant in the

archæological department of the British Museum. In this capacity he applied himself with untiring zeal to the study of Greek and Roman antiquities, including numismatics, and to Egyptian hieroglyphics. He assisted Baron Bunsen in the philological portion of *Egypt's Place in Universal History*, the last volume of which, after Bunsen's death, was admirably edited by him. In 1861 he was appointed keeper of the Egyptian and Oriental antiquities, and in 1874 was president of the London Congress of Orientalists. Besides three works connected with his Chinese studies, he was author of *Ancient History from the Monuments of Egypt* (1875), *Egyptian Texts* (1877), and was a contributor to various learned journals.

**BIRD, FREDERICK MAYER**, born in Philadelphia, Pa., June 28, 1838. He was a graduate of the University of Pennsylvania and Union Theological Seminary. He was ordained as Lutheran minister, served as an army chaplain, became a Protestant Episcopal clergyman, and was successively pastor at Spotswood, New Jersey, and South Bethlehem, Pa. He became professor of psychology, Christian evidence, and rhetoric in Lehigh University. He is a writer on hymnology, main editor of the "Lutheran Hymn Book," and possesses the finest library of hymnology in America.

**BIRD, ISABELLA (Mrs. Bishop)**, an adventurous lady traveler, long resident in Edinburgh, visited Canada and the United States in 1854, subsequently visiting the Sandwich Islands and Japan. While on her travels, she from time to time sent home letters describing what she saw and did, and from such materials most of her books have been compiled. Her lively and picturesque narratives of journeys made to the Rocky Mountains, to the aborigines of Yezo, and the shrines of Nihko and Ise in Japan, and the Straits Settlements, have been very popular. Her books are *The Englishwoman in America* (1858), *Six Months Among the Palm Groves of the Sandwich Islands* (1875), *A Lady's Life in the Rocky Mountains* (1879), *Unbeaten Tracks in Japan* (1880), and *The Golden Chersonese* (1883).

**BIRD-BOLT**, a short thick arrow without a point, spreading at the extremity so much as to leave a broad flat surface. Such are to this day used for killing rooks, and are shot from a cross-bow.

**BIRD-CATCHING SPIDER**, a name originally given to a large spider, *Mygalé avicularia*, a native of Cayenne and Surinam, but now more extensively applied, being equally appropriate, to a number of large species of *Mygalé* and *Epeira*, perhaps also of other genera.

The *Mygalé avicularia* is nearly two inches long, very hairy, and almost entirely black; its feet when stretched out, occupy a surface of nearly a foot in diameter. The books of its mandibles are strong, conical, and very black. This great spider forms a tube-shaped cell of a fine white semi-transparent tissue, like muslin, in clefts of trees or hollows among rocks; from this it issues only at night to prey upon insects and humming-birds. It is a native of the warm parts of America, the East Indies, and Africa.

**BIRD-CHERRY** (*Padus*), a subdivision of the genus *Cerasus*, a tree of 80 to 100 feet in height found from Tennessee to Upper Canada. The wood is compact, fine-grained, takes a fine polish, and is much used by cabinet-makers. The bark is used as a febrifuge, the fruit is not agreeable, but a cordial is made from it by infusion in spirits with sugar, and when dried and bruised it forms an esteemed addition to pemmican.

**BIRD ISLAND**, the northwest island of the Sandwich archipelago, in lat 22° 20' north, and long. 160°

west. It is, as its name implies, a mere haunt of sea-fowl, the links of the chain increasing pretty regularly in size and elevations from Bird Island on the northwest to Hawaii on the southeast.

**BIRD-LICE**, a popular name for lice which infest the plumage of birds. These parasites are louse-like in form, with from three to five jointed antennae, biting mouth organs, and more or less of a sucking mouth. The genera and species are numerous, constituting the greater part of the order *Mallophaga*.

**BIRD-LIME**, an adhesive substance placed on twigs of trees or wire netting for the purpose of catching small birds. A common practice is to place a decoy or tame bird in a cage near where the bird-lime is spread; the wild birds, attracted to the spot by the song of the tame bird, get entangled with the bird-lime.

**BIRD'S-EYE LIMESTONE**, a division of the Trenton group of the Lower Silurians of North America, apparently equivalent to the Llandeilo flags, and containing, besides the remains of brachiopods, many enormous orthoceratites.

**BIRD'S-EYE VIEW**, a term applied generally to modes of perspective, in which the eye is supposed to look down upon the objects from a considerable height. In sketching or drawing a locality, the great difficulty is to represent at the same time the relative heights of mountains and steepness of acclivities. In the 16th century the only kind of views known were of the nature of ground-plans, and the artists of the 17th century tried to combine this method with side views.

**BIRD'S FOOT**, a genus of plants of the natural order *Leguminosae*, deriving, both its popular and botanical name from the resemblance of the curved pods to birds' claws; the leaves are pinnate, with a terminal leaflet.

**BIRD'S FOOT TREFOIL** (*Lotus*), a genus of plants of the natural order *Leguminosae*, sub-order *Papilionaceae*. The pods are cylindrical, somewhat spongy within, and imperfectly divided into many cells. The name is derived from the resemblance of the cluster of pods to a bird's foot. The species are very numerous, and are natives of temperate and cold regions. The common bird's foot trefoil (*Lotus corniculatus*) has a stem from six to twelve inches in length, bearing umbellate heads of eight to ten yellow flowers, which have a rich honey-like smell. The leaves have three ovate leaflets like those of the clover, but at the base of each leaf-stem there are two large leaf-like ovate stipules. The plant is by some regarded as the shamrock of Ireland. It is eaten with great avidity by cattle, and its deeply penetrating roots adapt it well for very dry situations. A species called "winged pea," remarkable for four membranous wings, which run along its pods, a native of the south of Europe, is cultivated for its seeds, which are used as a substitute for coffee.

**BIRD'S NEST**, a name applied to two or more distinct plants, of similarly brownish color and leafless habit, which are root-parasites, and grow more or less concealed under other vegetation. *Nidus nidus-avis*, a British orchid, grows in dark woods, especially beech; *Monotropa hypopitys*, a rare ericaceous plant, grows on the roots of trees in beech or fir woods, the leafless stalks resembling a nest of sticks. There is also a bird's-nest fern, *Asplenium nidus*, so called from the manner in which the fronds grow, leaving a nest-like hollow in the center; and a group of gasteromycete fungi, the *Nidularia*, from their cup-shape and egg-like spor-bearing masses, have also acquired the same popular name.

**BIRDS OF NORTH AMERICA**. See the article *BIRDS* Britannica, Vol. III, pp. 699-778. See also under *DISTRIBUTION*, Vol. VII, pp. 297-400.

**BIRDS OF PREY**, a common title of the order of birds called *Accipitres*. Some birds, however, which do not belong to this order frequently pursue and prey upon other birds. Birds of prey are divided into two sections, *Diurnal* and *Nocturnal*, the latter consisting exclusively of owls, and the former including vultures, falcons and secretary birds or serpent-eaters. See Britannica, Vol. XVIII, p. 47.

SECRETARY BIRD.

**BIRETTA**, a square cap worn by the clergy of the Roman Catholic Church, and by some ritualists in the Anglican Church. That of priests is black, of bishops purple, of cardinals red. Originally round, its present form, with straight erect edges, and a tuft or button on the crown, dates only from the seventeenth century; but the low head-covering of English bishops was known as the *birettum* as early as the thirteenth century.

**BIRIOUTCHIE**, a town in the government of Voronej, Russia, on the left bank of the Sosua. It is surrounded with earthen ramparts and a ditch, and has four annual fairs. Population, about 4,000. A stream of the same name in its immediate vicinity is noted for its pearl-oysters, and the teeth of elephants are often found exposed on its banks.

**BIRKENFELD**, a German principality belonging to Oldenburg, with which it has been connected since 1817. It has an area of nearly 200 square miles, with a population of 38,685. The capital, Birkenfeld, has a population of 25,000.

**BIRKET-EL-HADJI** ("Lake of the Pilgrims"), a small lake ten miles northeast of Cairo, where the Mecca pilgrims assemble and disband.

**BIRLEY-MAN**, a person who acted as petty officer on an estate, or in a village in Scotland. The duty of this person was to keep order, and attend to the interests of the proprietor. The office is now nearly extinct.

**BIRMINGHAM**, a city of Alabama, and county-seat of Jefferson county, situated nearly in the center of the State, in a beautiful valley 600 feet above the level of the sea. The streets are broad, well paved, lined with shade trees, and well lighted. The court-house is a magnificent structure, and all the public buildings are erected in a substantial manner, as also are the churches, school-houses and hotels. Howard College (Baptist) is located at East Lake, near by. The United Charities have an infirmary costing \$100,000. Birmingham is located in the center of the richest coal and iron region in the State and blast furnaces and rolling mills are numerous, some of them being large structures, and affording facilities for an immense and rapidly growing manufacturing business. The Henderson Steel Manufacturing Company is making good steel from the red ores found in the vicinity, and have recently completed a large blast furnace with a capacity of seventy tons daily. There were in 1890 three through lines of railway—three other railways having their terminal in the city; while still three other roads were in process of construction, thus providing ample communication in all directions. In addition to the iron industry there are numerous manufactories, employing a large mechanical force. The recent growth of the city in population has been remarkable, the census

of 1880 showing an enumeration of but 3,886, while in 1890 there were 26,241.

**BIRMINGHAM**, a borough of New Haven county, Conn., situated on the Housatonic River, at the mouth of the Naugatuck, about ten miles west of New Haven. The first pin manufactory established in America is located here, and there are extensive manufactories of chains, augers, axles, springs, corsets, skirts, stockings, paper, silver-plate, and a number of rolling-mills and foundries.

**BIRNAM**, a hill 1,580 feet high, in the east of Perthshire, Scotland, twelve miles northwest of Dunsinnan hill. It commands a fine view of the valley of the Tay. It was once covered by part of an ancient royal forest. Shakespeare has immortalized Birnam wood in his tragedy of *Macbeth*.

**BIRNEE**, OLD AND NEW, the name of two towns of Bornu, Central Africa. Old Birnee, which was formerly the chief city of the empire, walled and of vast extent, is situated on the banks of the Yeu, seventy miles northwest of the modern capital, Kuka, and seventy-five miles west of Lake Tsad. It is now greatly deserted and decayed, but has still a population of about 10,000. New Birnee, about twenty miles south of Kuka, is walled and has a large mud palace. Population, 10,000.

**BIRNEY**, DAVID BELL, son of James G., born at Huntsville, Ala., May 29, 1825, died at Philadelphia, Pa., Oct. 18, 1864. He studied law in Cincinnati, and practiced in Philadelphia; entered the Union army and rose to the rank of major-general.

**BIRNEY**, JAMES GILLESPIE, born at Danville, Ky., Feb. 4, 1792, died at Perth Amboy, N. J., Nov. 24, 1857. He graduated from Princeton in 1810. He served in the Kentucky and afterwards in the Alabama legislature; was repeatedly elected mayor of Huntsville, Ala.; was interested in all educational projects in his State; was long the adviser of the Cherokee Nation. Being opposed to slavery and a warm advocate of his views thereon, he emancipated his slaves, having previously removed to Kentucky. Mob violence necessitated his leaving here and going to Cincinnati, Ohio. He published the "Philanthropist," but in 1836 his office was entered by a mob and his presses thrown into the river. He went to live in New York city after this, and served the American Anti-Slavery Society as secretary. He was the presidential nominee of the Liberty Party in 1840, and again four years later. Mr. Birney was the author of many books on the subject of slavery.

**BIRNEY**, JAMES GILLESPIE, a grandson of James G., senior; was an officer in the civil war, and served under Sherman and Custer. He died soon after the war.

**BIRSE**, a small but famous affluent of the Rhine. It rises in Berne, Switzerland, flows through Münsterthal, and enters the Rhine near Basel. At St. Jacob, the "Swiss Thermopyke," about two miles from that city, 1,500 Swiss died fighting the French in 1444, and in July, 1449, near the village of Dornbach about a mile and a half south of Basel, 6,000 Swiss gained a victory over 15,000 Austrians.

**BIRN**, BERROO, or BEEROO, a kingdom of Soudan, Western Africa, bounded on the north by the Sahara, on the east by the Niger, and having Bambarra on the south.

**BIS**, in music, denotes that the passage over which it is placed is to be played twice. Such passages generally have a slur over them and the "bis" written below it.

**BISACQUINO**, or BUSACCINO, a town of Sicily, about twenty-seven miles south of Palermo. Population, 9,000.

**BISALNAGAR**, a town of India, in the Guicowar of Baroda's territories, 220 miles northwest of

Mhow. It has a large transit-trade, and manufactures cotton cloths. Population, 20,000.

**BISALPUR**, a town of India, in the North-west Provinces, twenty-four miles east of Bareilly. Population, 9,000.

**BISCACHA**. See VISCACHA, in these Revisions and Additions.

**BISCAYNE**, a village of Florida, on Biscayne Bay, in Dade county, overlooking the Atlantic. It is noted for its delightful climate and the healthfulness of its situation.

**BISCHOFF**, THEODOR LUDWIG WILHELM, anatomist and physiologist, born at Hanover, Oct. 28, 1807, died Dec. 5, 1882. He studied at Bonn and Heidelberg, becoming in 1836 extraordinary professor, and in 1843 ordinary professor of anatomy and physiology at Heidelberg. From 1844 to 1855 he filled the same chair at Giessen, where he founded a physiological institute and anatomical theater, and from 1855 to 1878 at Munich. Bischoff's studies were mainly in embryology and biology, and he left numerous treatises and papers of great value.

**BISCUIT**, in pottery, the term applied to porcelain and other earthenware after the first firing, and before it has received the glaze and embellishments. In this condition, the ware is very porous, adheres to the tongue when placed upon it, and allows water very slowly to percolate through its pores. The unglazed bottles employed in cooling water and the common flower-pot are examples of biscuit-ware. See Britannica, Vol. XIX, p. 601.

**BISHOP**, a beverage composed of red wine, poured warm or cold, over ripe bitter oranges, sugared and spiced to taste, the quality depending upon the excellence of the wine employed. If white wine is used the beverage is called *cardinal*, and with Tokay it becomes *pope*.

**BISHOP-AUCKLAND**, a small town in the middle of the county of Durham, England. It contains the abbey-like palace of the Bishop of Durham.

**BISHOP**, MADAM ANNA, a famous concert singer, born in London, England, in 1814, died in New York in 1884. She possessed a soprano voice of unusual power, and sang in nearly all the countries on the globe, retaining her voice until 1868, when she retired from the stage. Her first husband was Sir Henry Rowley Bishop, to whom she was married in 1831. Leaving him in 1835 she contracted an alliance with her Italian music teacher, named Boscha, and after his death in 1855, became the wife of an American merchant, Martin Schultz. Her father's name was Rivière.

**BISHOP'S CASTLE**, a town in the southwest of Shropshire, nineteen miles southwest of Shrewsbury. It is irregularly built on a hill slope. The bishops of Hereford had formerly a castle here, now destroyed. During the civil wars of the seventeenth century, the inhabitants took shelter in the church, which was demolished over their heads. Population, 2,200.

**BISHOP-WEED** (*Egopodium podagraria*), an umbelliferous weed, exceedingly difficult of extirpation on account of its creeping rhizomes. It is eaten by cattle, and the leaf-stalks were formerly boiled and eaten as greens. In the United States the name is applied to a somewhat similar umbelliferous plant, *Discopleura capillacea*.

**BISIGNANO**, a town of Italy in the province of Cosenza. It has a cathedral, a castle and a trade in silk, and gives the title of prince to the existing branch of the Sanseverino family. Population, 4,097.

**BISLEY**, a town of Gloucestershire, eleven miles southeast of Gloucester. The church contains some interesting monuments, a cross-legged knight in

armor, and an ancient stone font. The canal uniting the Severn and the Thames passes through the town. The chief manufacture is coarse clothing. Population, 2,000.

**BISMARCK**, a city of North Dakota, capital of the State and county-seat of Burleigh county, situated on the Missouri River, about sixty miles north of the southern boundary of the State. The situation of the city is a delightful one, commanding charming views of the Missouri valley and the surrounding region. The principal buildings are the capitol, built upon an eminence in the northern part of the city, the penitentiary, the court-house, and a fine public school-house. A bridge which cost a million and a half of dollars here crosses the river, which is navigable for more than a thousand miles above Bismarck. The chief industries, besides the shipping of immense quantities of freight, are manufactures of flour and of malt-products. Bismarck is the center of trade of a region rich in wheat, oats and potatoes.

**BISMARCK-SCHÖNHUSEN**, OTTO EDWARD LEOPOLD, PRINCE VON, ex-chancellor of the German empire, and foremost of statesmen, was born April 1, 1815, at Schönhausen in Brandenburg, of an old family, of which various members gained reputation both as soldiers and as statesmen. He received his University education at Göttingen, Berlin and Griefswald, where he studied law and agriculture, but became more distinguished as a swordsman than as a reading man. After finishing his studies he lived for a time on his estates. Before 1847 he was little heard of, but about that time he began to attract attention in the new Prussian parliament as an ultra-royalist.

Bismarck's diplomatic career commenced in 1851, when he was appointed Prussian member of the resuscitated German diet of Frankfurt. Here he began to manifest that zeal for the interests and aggrandizement of Prussia which afterwards undeviatingly guided him, and openly expressed discontent with the predominance of Austria. He remained at Frankfurt till 1859, when he was recalled from the diet and sent as minister to St. Petersburg. In the spring of 1862 he was transferred to Paris. During his short official stay there he visited London, and met the leading politicians of the time. In the autumn, when the king's government could not obtain the consent of the lower house to the new and expensive military organization, Bismarck was recalled to take the portfolio of the ministry for foreign affairs, and the presidency of the cabinet. Being unable to pass the reorganization bill and the budget, he closed the chambers, announcing that the government would do without the sanction of the deputies. See *Britannica*, Vol. XX, pp. 12, 13. The army reorganization went on; and the next four sessions of parliament, refusing their sanction, were dissolved in the same way.

At the death of the king of Denmark Bismarck was adroit enough to aggrandize Prussia by the acquisition of the Elbe duchies, and reconciled his opponents to his high-handed policy by pointing to this success of the newly-modeled army. Throughout the events which ended in the humiliation of Austria at the battle of Königgrätz (1866), and the reorganization of Germany under the leadership of Prussia, Bismarck was the guiding spirit, and through this success, from being universally disliked, he became the most popular man in Germany.

The action of France in regard to the candidature of Prince Leopold of Hohenzollern for the throne of Spain gave Bismarck the opportunity of carrying into action the intensified feeling of unity

among Germans. During the Franco-German war of 1870-71 he was the spokesman of Germany; he it was who, in February, 1871, dictated the terms of peace to France.

Having been made a count in 1866, Bismarck was now created prince and chancellor of the German empire. After the peace of Frankfurt (May 10, 1871), the aim of his policy, domestic and foreign, was to consolidate the young empire of his own creating by rendering its institutions more beneficent, authoritative, homogenous and stable, and to secure it, through alliance and political combinations against attack from without. Thus, conceiving the authority of the government to be endangered by the Church of Rome and its doctrines, he embarked on a long and bitter struggle with the Vatican. But he had underrated the resisting power of the Romish Church, and motives of political expediency finally led him to modify his policy.

Among the more important measures by which Bismarck's domestic policy was marked are a reformed coinage, a codification of law, a nationalization of the Prussian railways, fiscal reform in the direction of making the empire self-supporting (independent of "matricular contributions" from its component states), repeated increase of the army and the regular voting of its estimates for seven years at a time, and the introduction of a protective tariff (1879). He attempted to combat social democracy by means of economic experiments, which caused him to be called the greatest state socialist of the age.

In 1884 Bismarck inaugurated the career of Germany as a colonizing power, which brought him into temporary conflict with the England of Mr. Gladstone. For the rest, his foreign policy was mainly aimed at isolating France and rendering her incapable of forming anti-German alliances, while, on the other hand, he gradually combined the central powers of Europe into a peace-league; aiming at counteracting the aggressiveness of Russia and France, separately or combined, on the Danube or the Rhine. In 1885 Bismarck's 70th birthday was celebrated as a great national event.

The resignation by Prince Bismarck of his office as Prussian Prime Minister as well as chancellor was announced in February, 1890, but did not actually occur till March 17, when divergences of opinion between him and the Emperor, William II led to his retirement. His departure from Berlin on the 29th was made the occasion of a great popular demonstration in his favor. The ex-chancellor has since resided chiefly at his country residence. It has recently been reported that he had been offered, and would probably accept, a seat in the Reichstag, but at the present writing (March, 1891) reports have not been confirmed.

**BISON**. (See *Britannica*, Vol. III, p. 792.) The name buffalo, which is incorrectly applied in the United States to the American bison, belongs properly to two species of ruminants of the family *Bovidae*, one of which is used as a beast of burden in India and Italy, the other being a dangerous, untamable native of South Africa. The *Bison Americanus* is a species of the ox family, and is indigenous to America. It differs from the buffalo in having a hump upon its back, in having no dewlap, in having its horns turned inward, and in having cavities in the horns communicating with the nasal passages.

**BISSAGOS**, or BIRGA ISLANDS, a group of small volcanic islands off the west coast of Africa, opposite the mouth of the Rio Grande. Many of the islands appear to be thickly settled by a savage, thievish, negro race, who cultivate maize, bananas,

and palms, and feed cattle and goats, which constitute their chief wealth. Bassao, one of the group, on which there is a Portuguese settlement, has a population of 8,000. It carries on a large trade in slaves, also in rice, wax, hides, etc. See *Britannica*, Vol. XXI, p. 661.

BISEN, WILHELM, a Danish sculptor, born near Schleswig in 1798, died in 1868. He studied for 10 years in Rome, 1823 to 1833, under Thorwaldsen, and in 1841 returned to that city to execute a government commission, and produced a *Venus and Cupid Sharpening His Arrows*, that are among his masterpieces. By his will Thorwaldsen appointed Bissen to complete his unfinished works and have charge of his museum. In 1850 he became director of the Academy of Art in Copenhagen. See *Britannica*, Vol. XXI, p. 570.

BISTORT, a perennial herbaceous plant of the genus *Polygonum*, of the natural order *Polygonaceae*. It is from one to two feet high, with a simple stem, ovate subcordate leaves, and one dense terminal cylindrical spiked raceme of flesh-colored flowers. The root is one of the strongest vegetable astringents.

BISTRE, a pigment of a warm brown color prepared from the soot of wood, especially beech. It is used in water-colors after the manner of India ink.

BISTRITZ, a fortified town of Northeast Transylvania, beautifully situated on the Bistritz River, in a fine valley. In its vicinity are the remains of an ancient castle, once the residence of the illustrious Hunyads. It has several large cattle fairs, but the extensive general trade it once carried on is now entirely gone. Forming, as it does, the last strong position in the northeast of Transylvania, it was repeatedly the scene of hot strife between the Hungarian and Austrian generals, in 1848 and 1849. Population, 7,312.

BIT, or BITT, in ship-building, a frame composed chiefly of two short, strong, vertical timbers, fixed into or upon the deck in the forepart of the vessel. Its main purpose is for fastening the cable when the ship rides at anchor, and for "leading" the principal ropes for the rigging. To "bit the cable" is to fasten it round the bit. There are various kinds of bits—"riding-bits" "jeer-bits," etc. Having to resist great strains, the bits are strongly bolted to the beams that support the deck.

BITHOOR, a town in India, in the district of Cawnpore, and sub-presidency of North-west Provinces, situated on the right bank of the Ganges. It is particularly devoted to the worship of Brahma; has numerous pagodas, and is, of course, a favorite resort for pilgrims, who here, as at Benares and Ben-draban, have by means of elaborately constructed ghauts access to the sacred stream for purposes of ablution. During the mutiny of 1857 Bithoor acquired an unenviable notoriety as the stronghold of Nana Sahib. Population, 9,000.

BITTER KING, a small tree or shrub of the natural order *Simulbaceae*, which has received its name from its intense bitterness. It is a native of the Indian archipelago, and is used as a febrifuge and tonic.

BITTERN, or SALT OIL, an oily liquid obtained during the preparation of common salt—the residue when salt water has been boiled and the salt precipitated—and from it Epsom salts and other compounds of magnesia are procured.

BITTER ROOT RIVER, a stream 110 miles long in Montana. It is a branch of Clarke's River. Gold is found near the Bitter Root.

BITTER SPAR, a name given to dolomite from the magnesia contained in it, which the Germans call bitter salt.

BITTER-SWEET, or WOODY NIGHTSHADE. See NIGHTSHADE, *Britannica*, Vol. XVII, p. 499.

BITTERWOOD, a tree of the natural order *Simulbaceae*, a native of Jamaica. The wood is used in medicine for the same purpose as quassia. The name is also given to species of the genus *Xylopia*, remarkable for the bitterness of their wood.

BITUMINOUS COAL, a term applied to the varieties of coal which contain a large quantity of gas, and burn with a smoky flame.

BITUMINOUS LIMESTONES, limestones impregnated and sometimes deeply colored with bituminous matter, obtained from decaying vegetable matter, or from the decomposed remains of those animals whose hard parts form so large an amount of the rock.

BITUMINOUS SHALES, indurated beds of clay occurring in the coal measures and containing such an amount of carbon and volatile matter that they are able to keep up combustion when mixed with but a little coal. They are, indeed, impure coal, with a large percentage of ash or earthy matter, which after burning retains the original form.

BIVOUEAC, the encampment of soldiers in the open air, without tents where every one remains dressed, and with his weapons by him. Even during the Seven Years' War it was no uncommon thing for the whole army, when in the vicinity of the enemy, to pass the night in their ranks, each lying down in his place, in order to be ready to stand to their arms at a moment's notice; but the French revolutionary army introduced the practice of dispensing with tents altogether, and regularly passing the night *en bivouac*. From this source originated the rapidity in their motion, which made them successful for a long time, and the practice was afterwards initiated by other armies of Europe. Soldiers in bivouac light fires, and improvise, where it is possible, huts of straw, branches, etc. But this mode of encampment, though favorable to celerity of movement, is purchased at the expense of the soldiers' health, besides being destructive of discipline by leading to plundering houses, fruit trees, etc., in the vicinity, and is now almost wholly dispensed with; for permanent encampment regularly constructed wooden huts have been introduced.

BIELA, a town in the Russian-Polish government of Siedlec, on the Krzna River. It has considerable trade in corn. Population, 19,500.

BJÖRNSON, BJÖRNSSTJERNE, a Norwegian writer, born Dec. 8, 1832, at Kvikne, in Østerdalen, where his father was pastor. After studying at the University of Christiania from 1852, and then for a year at Copenhagen, he returned to Norway in 1857, and published his *Symjøre Solbakken*, which at once attracted great attention. Immediately afterwards he was appointed manager of the Bergen Theater by its proprietor, Ole Bull, and in 1858 he published the tale *Arne* and the drama *Halte-Tulda*. In 1859 he left Bergen to become editor of the *Aftenbladet* at Christiania, but becoming involved in violent controversies he withdrew the next year to Copenhagen, where he published a number of shorter tales and the drama, *Mellum Slagene*. From 1860 to 1862 he resided in Rome, continuing his literary work, and on his return to Norway he was awarded a yearly pension by the Storting. In the next two years he produced two plays, at the same time editing the *Norsk Folketidning*. He again lived abroad from 1872 to 1876, when he returned to Norway and remained for some years. Holding the highest place in popular favor as a political orator, Björnson took an active part in the movement which led to the victory of parliamentary government in Norway. Though

he settled in Paris in 1883, he still made his influence felt in Norwegian politics. A number of his tales have been translated into English and German, and several of his plays have secured a footing on the German stage. Both as poet and novelist Björnson stands in the first rank among living Scandinavian writers. He has written numerous pamphlets on political and religious questions of the day. See *Britannica*, Vol. XVII, pp. 591, 592.

**BJÖRNSTJERNA** (Magnus Friedrich Ferdinand), Count (1779-1847), a Swedish statesman and author, born at Dresden in 1779. He was educated in Germany, and entered Sweden for the first time in 1793, to join the army, and in 1813 he was appointed lieutenant. In 1826 he received the title of count, and in 1828 was appointed ambassador to the court of Great Britain, which office he held till 1846, when he returned to Stockholm, where he died in 1847. As a politician his opinions were liberal. In addition to some political writings he published in 1843 a work on the *Theogony, Philosophy and Cosmogony of the Hindus*.

**BLACK, ADAM**, publisher, born in Edinburgh, Feb. 20, 1784, died Jan. 24, 1874. He was trained as a bookseller in his native city and in London. Forming a partnership with a nephew, he established the Edinburgh business of Adam and Charles Black. The firm gained position and fortune chiefly through the purchase of the copyright of the *Encyclopædia Britannica* in 1827, after Constable's failure; and that of Scott's novels from Cadell's representatives in 1851. A seventh and eighth edition of the *Britannica* was issued during Black's business connection with the firm, while Scott's novels had a large and steady sale. Black was a prominent and useful citizen of Edinburgh; was twice lord-provost, and was Liberal M. P. for Edinburgh (1856-65). A statue was erected at Edinburgh in 1877, in recognition of his services.

**BLACK, JAMES**, born at Lewisburg, Pa., Sept. 23, 1823. He is a lawyer and an earnest laborer for temperance, and was the first presidential nominee of the prohibition party (1872).

**BLACK, JEREMIAH SULLIVAN**, born in the Glades, Somerset county, Pa., Jan. 10, 1810, died at York, Pa., Aug. 19, 1883. He was not a college graduate, but after studying in the common schools he took up the profession of law, and after eleven years was made judge. He was a Jeffersonian Democrat, was president-judge of his district for nine years, and was elected one of the supreme court judges of Pennsylvania in 1851 and again in 1854. James Buchanan, when he became president, chose Judge Black as attorney-general. He performed important duties while holding this office; he protected the government from unjust claimants of land grants in California, and held the opinion (1860-61) that the government had the right to put down insurrection. As Buchanan believed the government had no coercive power, the attorney-general was placed in a trying situation, as he endeavored to save the government from the secessionists. During the latter part of Buchanan's administration, Judge Black was Secretary of State (filling the vacancy of Gen. Cass, resigned), and Edwin M. Stanton held Black's former office. In 1861 he retired from public life. He was engaged in several prominent lawsuits, such as the Vanderbilt will contest and the McGarraban claim.

**BLACK, JOHN**, an eminent newspaper editor, and classical scholar of some reputation, born in Berwickshire in 1783, died in 1855. Left an orphan at the age of twelve, he commenced life in the office of a writer, but soon left that place for Edinburgh, where he became a writer's clerk. While in this capacity he was assiduous in the work of self-edu-

cation; he acquired German from a German musician, and Italian from a refugee. In 1810 he went to London, and was engaged as a parliamentary reporter for the "Morning Chronicle," of which paper he afterwards became editor. He retired from the editorship in 1843.

**BLACK, WILLIAM**, a Scotch novelist, born in Glasgow in 1841. He began his career as a journalist. He was special correspondent of the "London Star" during the war between Prussia and Austria in 1866, and was subsequently assistant editor of the "London News." The work by which he became known as an author of established reputation was *A Daughter of Heth*, published in 1871. *A Princess of Thule* (1873) is perhaps the best of his numerous works. In 1874 he abandoned journalism, and in 1876 he visited America. During 1888 he wrote for "Harper's Magazine." At the present writing, 1891, his most recent work is *The New Prince Fortunatus*.

**BLACK ACTS**, the acts of the Scottish parliament of the first five Jameses, those of Queen Mary's reign, and of James VI down to 1587. They were called the black acts because they were all printed in the black or Saxon characters.

**BLACK ASSIZE**, the common name of an extraordinary and fatal pestilence which broke out at Oxford at the close of the assizes 1577, immediately after the passing of sentence on Richard Jencks, condemned to lose his ears. It was supposed to be a Divine judgment on the cruelty of the sentence; but it is satisfactorily explained by the pestilential atmosphere of the adjoining jail, then, as it was long after, a place of misery, filth, and disease. From July 6 to Aug. 12, 510 persons died in Oxford and the neighborhood of this dreadful malady, among whom were the chief officials who sat on the assize, most of the jury, and many members of the University. Women, children, physicians, poor people, and visitors are said to have escaped the infection.

**BLACK-BAND IRONSTONE**, an ore of iron found very extensively in Scotland and elsewhere. It occurs in the Carboniferous system in regular bands, layers, or strata, and generally associated with coal and limestone. It is mainly a carbonate of iron, accompanied by much coaly matter, and can be easily reduced. See *Britannica*, Vol. XIII, p. 285.

**BLACK BEETLE**, a popular name for the common cockroach of Great Britain. The term is also applied to a great family of beetles known as *Melanocephala* in the heteromeric suborder of *Coleoptera*.

**BLACKBERRY**, a name common to several roseaceous plants of the genus *Rubus*, and to their fruit which consists of many small juicy drupelets, which unlike those of the raspberry, fall off with their receptacle. Several varieties of blackberry are extensively cultivated in the United States. The roots of the high-blackberry, *Rubus villosus*, and of the low-blackberry or dewberry, *Rubus canadensis*, are much used in medicine as a tonic astringent.

**BLACK BOOK**, a collection of English admiralty law in the 14th century, first edited by Sir Travers Twiss (four volumes, 1871-76). It indicates the pretensions of the civil law as regards trial without jury, torture, etc., which afterwards led to legislation in vindication of the position of the common-law courts. *Black Book* is also a usual term for the reports presented to parliament in 1536, on which the legislation for the dissolution of the monasteries and the secularizing of their revenues proceeded. These reports probably never existed as a book. A list of habitual criminals, first published in 1877, has been also so called. See *Britannica*, Vol. I, p. 157; Vol. XXI, p. 584.

**BLACK-BULLY**, or **SAPODILLA**, *Achras Sapota*, a large South American tree, belonging to the *Sapotaceæ*. It is cultivated for its fruit, the sapodilla or sapodilla-plum. Its wood, which is of a reddish-brown color, and very durable, is used for ship-building.

**BLACKBURNE**, FRANCIS, Lord Chancellor of Ireland, born at Great Footstown, County Meath, Nov. 11, 1782, died Sept. 17, 1867. In 1798 he entered Trinity College, Dublin. Called to the English bar in 1805, and to that of Ireland in 1822, he was appointed attorney-general for Ireland in 1830, and again in 1841, master of the rolls in 1842, chief justice of the Queen's Bench in 1846, and lord chancellor of Ireland in 1852 and 1866. He thus served under both Whig and Tory governments, and was brought into close connection with the leading politicians on either side; while at different times he had the duties imposed on him of prosecuting O'Connell, and judging Smith O'Brien. In 1867 he declined an offer of a baronetcy.

**BLACK CAP**, the cap worn by English judges as a part of full dress, and so put on by them when a prisoner is condemned to death.

**BLACKCAP**, **BLACKCAP WARBLER**, or **BLACKCAP FAUVETTE** (*Sylvia atricapilla*), a bird of the great family of the *Sylviacæ*, or *Warblers*. It is regarded as the sweetest song-bird in Britain, or indeed in Europe, except the nightingale; it is a rather smaller bird than the nightingale; the general color is gray, with an olive tinge above and becoming white below; the upper part of the head is black, and the feathers somewhat erected, giving the bird a hooded appearance. In Britain the blackcap is only a bird of passage, though it extends its migrations as far north as Lapland. In the South of Europe it is found both in summer and winter. See *Britannica*, Vol. XXIV, p. 553.

**BLACK CHALK**, various kinds of clay-slate, containing a considerable proportion of carbon. It is used for drawing, and is also ground down to form a black paint. It is found as a rock of slaty texture and bluish-black color in the island of Islay and in Caernarvonshire; also in Spain.

**BLACK DEATH**. See *PLAGUE*, *Britannica*, Vol. XIX, p. 164.

**BLACK DRAUGHT**, a popular purgative medicine, consisting of an infusion of senna with sulphate of magnesia.

**BLACK EARTH** (*Tchernozem* of Russian geologists), the name given to a deposit which covers vast areas in southern Russia. It closely resembles the löss of Central Europe in texture and structure, and bears the same relation to the glacial accumulations of Russia that the löss of the Rhine, the Danube, etc., does to those of Central Europe. It is probably the fine-grained silt derived from the torrents that escaped from the melting snows and glaciers of the Glacial period. It varies in color from dark brown to black, and in thickness from a foot or two up to six or seven yards, occasionally reaching, it is said, even to 60 feet.

**BLACKFEET INDIANS**, a tribe of North American Indians, the most western division of the Algonquin stock. See *INDIANS, AMERICAN*, in these *Revisions and Additions*.

**BLACKFISH**, a fish of the family of the *Scombridae*, very nearly allied to the beautiful *Coryphænes*, so frequently called dolphins. It is found in the Mediterranean Sea and on the western coasts of Europe. It is 30 inches in length, weighs about 11 pounds and has a single elongated dorsal fin with short rays rising from a thin elevated ridge; the skin is tough and can be stripped off like that of an eel. The blackfish, or the *Taotoquamitis*, found along the American coast, is highly esteemed

for the table. A species of whale is also called blackfish. See *Britannica* Vol. XXIV, p. 686.

**BLACK FLUX** is prepared by heating in a covered crucible ordinary or crude cream of tartar, or the bitartrate of potash, when the tartaric acid is decomposed and charred, forming carbonic acid, which remains in combination with the potash as carbonate of potash, accompanied by much free carbon. This very intimate mixture of carbonate of potash and carbon is a fine black powder of great service in the fluxing of metallic ores, as of lead, and the separation of the metal therefrom. The black flux is likewise employed as the raw material from which, on the application of heat in iron vessels, the metal potassium can be obtained.

**BLACK FRIARS**, friars of the Dominican order. The old Dominican monastery in London, dating from 1276, stood near the north end of Blackfriars Bridge.

**BLACK FRIDAY**, any Friday marked by a great calamity. In England it has especial reference to Dec. 6, 1745, as being the day on which news was received in London that the young pretender, Charles Edward, had reached Derby; or to May 11, 1866, from a commercial panic then at its height, caused by the stoppage of Overend, Gurney & Co., London. In the United States it has reference to the financial panic caused by speculation in gold in the city of New York, Sept. 24, 1869; or to a similar panic, which began Sept. 18, 1873.

**BLACKGUARD**, a term used in the 16th century for the lowest menials of a noble house—the scullions who cleaned pots and pans. It was also used of the bangers-on of an army, camp-followers, then a rabble, and now used of vagabonds in general.

**BLACK HAWK**, a noted chief of the Sac and Fox Indian tribes, born in 1767 at Kaskaskia, Ill., died at his camp on the Des Moines River, Oct. 3, 1838. Black Hawk and 500 warriors joined the British in the war of 1812. When the main body of the two tribes removed to the western bank of the Mississippi, Black Hawk and his followers refused to go, although their lands had been given to the whites by treaty. After considerable trouble the Indians began to massacre the settlers, and a United States force was sent out to conquer them. On Aug. 2, 1832, Black Hawk was obliged to surrender.

**BLACK HILLS**, a group of mountains in South Dakota and Wyoming Territory. Laramie Peak, the highest in the range, rises 8,000 feet above sea level. This region being fertile, well wooded and watered, is adapted to dairying, but the mountains are most noted for their gold, limestone, lead and tin.

**BLACKHEATH**, an open common in the county of Kent, five miles southeast of London. It commands a fine view of great extent, and being a healthy tract many villas have been built on its margin. It is a favorite holiday resort for Londoners. It is one of the few places where the ancient Scottish game of golf is practiced. Here the Danes encamped in 1011, and the Londoners welcomed Henry V from Agincourt.

**BLACK HOLE**, a name given to a dungeon or dark cell in a prison, but especially associated with an apartment known as the "Black Hole of Calcutta," where, in 1756, a party of English were confined in the most cruel manner. The garrison of the fort connected with the English factory at Calcutta having been captured by the Nabob Suraja Dowlah, this barbarian caused the prisoners, 146 in number, to be confined in a cell 20 feet square, which had only two small windows, and these were obstructed by a veranda. The crush of the sufferers was dreadful, and after a night of agony from pressure, heat, thirst, and want of air,

there were in the morning only 23 survivors. See *Britannica*, Vol. IV, p. 656; Vol. XII, p. 801.

**BLACKIE**, JOHN STRAIT, a Scottish writer, born in Glasgow in 1800. He was educated at Aberdeen and Edinburgh, and in 1829 went to the Continent, where he continued his studies at Göttingen and Berlin, and afterwards at Rome. In 1831 he published a good metrical translation of Goethe's *Faust*, and in the same year passed as advocate at the Edinburgh bar. But he was more interested in literary pursuits than in the practice of his profession, and soon became known by his articles on German subjects contributed to the magazines of the time. In 1841 he was appointed to the chair of Humanity in Marischal College, Aberdeen, which he held until 1852, when he was elected to the Greek chair in the University of Edinburgh. After he became professor he took an active part in promoting educational reform, and in the movement that led in 1859 to the remodeling of the Scottish Universities. He always figured as a patriotic champion of Scottish nationality and its characteristic features. During the years of 1874-76 he advocated throughout the country with great enthusiasm the foundation of a Celtic chair in Edinburgh University, and was successful in raising a large sum for its endowment. He resigned his chair in 1882. He published a fine verse translation of Æschylus in 1850, another of the *Iliad* in ballad meter in 1866, as well as several volumes of verse. His prose works embrace moral and religious philosophy, the method of history, the land laws and a short life of Burns (1888). His principal philological papers were collected in *Hæra Hellenica* (1874). In the same year he published *Self-Culture*.

**BLACKING**, the material employed for producing a black, glazed, shining surface on leather. The main ingredient in various kinds of blacking is bone-black, which is mixed with oil, raw sugar or molasses, and a little sulphuric acid.

**BLACK ISLE** is a common name for the peninsula, in Easter Ross, lying between the Beaulie and Moray Firths and Cromarty Firth. See Ross, *Britannica*, Vol. XX, p. 854.

**BLACK JACK**, a name given by miners to blende. It was also in former times the name applied to a kind of drinking flagon.

**BLACK LEAD**, the popular name of graphite, or plumbago, a mineral consisting chiefly of carbon. See CARBON, *Britannica*, Vol. V, pp. 86, 87.

**BLACK LETTER**, a name now commonly applied to the Gothic or Old English letter, which was introduced into England about the middle of the 14th century. See TYPOGRAPHY, *Gothic*, *Britannica*, Vol. XXIII, p. 694.

**BLACK LIST**, a name applied to printed lists connected with insolvency, bankruptcy, and other matters affecting the credit of firms and individuals, and which are circulated for the private guidance of the mercantile community, with a view of affording protection against bad debts, frauds, etc. The term is also frequently used of any list of persons who are deemed objectionable by the makers or users of the list.

**BLACKMAIL**, a rent or tribute formerly exacted by freebooting chiefs from the people in the Border counties of England and Scotland, and along the Highland border. It was a kind of compromise with robbers, and bought immunity from the attacks not only of those to whom it was paid, but also of others. It continued to be exacted along the Highland border until about the middle of the 18th century. The term is now applied to extortion of any kind by intimidation. It usually implies involuntary payment of money through fear of threatened injury to reputation.

**BLACK MONDAY**, Easter Monday, April 14, 1360, so called from the extraordinary darkness and the fatally bitter cold. Stow, in his *Annals* says: "The 14 day of April and the morrow after Easter day, King Edward (III) with his host lay before the city of Paris, which day was full darke of mist and haile and so bitter cold that many men dyed on their horses with cold; wherefore unto this day it hath bene called the *Blacke Munday*."

**BLACKMORE**, RICHARD DODDRIDGE, an English novelist, born at Longworth, Berkshire, in 1825. Educated at Blundell's School (Tiverton), and Exeter College, Oxford, he subsequently studied law, was called to the bar in 1852, and practiced for a time as a conveyancer. His first publications were *Poems by Melander* (1854), *Epullia* (1855), *The Bugle of the Black Sea* (1855), followed by *The Fate of Franklin* (1860), and a translation of the first and second books of Virgil's *Georgics* (1862). Other volumes of verse have followed these, as well as a complete translation of the *Georgics* in 1871. His first novels were: *Clara Vaughn* (1864) and *Cradock Nowell* (1866), but his first distinct success was *Lorna Doone, a Romance of Exmoor* (1869), which reached a 22d edition in 1884, and has remained the favorite of his works. His other novels are: *The Maid of Sker* (1872) perhaps his second best story; *Alice Lorraine* (1875), *Cripps the Carrier* (1876), *Erema* (1877), *Mary Auerley* (1880), *Christowell, a Dartmoor Tale* (1882), *Tommy Upmore* (1884), and *Springhaven* (1887).

**BLACK MOUNTAINS**, a group in Yancey county, N. C., a short distance west of the Blue Ridge, so called from the balsamic firs which grow on the crests of the mountains. Black Dome, or Mitchell's High Peak, is 6,707 feet, the highest peak east of the Rockies, and is named for Dr. Mitchell, of North Carolina, who died while exploring the region, and who is here buried.

**BLACK OAK**, a handsome large tree of the United States, constituting the genus *Quercus tinctoria*, or, according to some botanists, a variety of *Quercus coccinea*. It yields a thick bark much used for tanning and from which the yellow dye known as quercitron is obtained.

**BLACK PRINCE**, the popular title conferred upon Edward (1330-76), eldest son of Edward III. It is said, but not proven, that the name was given from the color of the armor worn by him. See *Britannica*, Vol. VII, p. 656; Vol. VIII, p. 319.

**BLACK QUARTER**, an infectious disease of cattle. See MURRAIN, *Britannica*, Vol. XVII, p. 58.

**BLACK RIVER**, or BIG BLACK RIVER, a stream 350 miles long which rises in Iron county, Mo., flows southwestward into the White River at Jacksonport in Arkansas, and is navigable, when the water is high, for about 100 miles, by small river steamboats.

**BLACK RIVER**, of New York, about 125 miles long, rises in Herkimer county, flows in a northwesterly direction and empties into Lake Ontario near Watertown. The Black River Canal, between Lyon's Falls and Rome, allows boats to pass from the river into Erie canal.

**BLACK RIVER FALLS**, a town of Wisconsin, county-seat of Jackson county, situated on Black River, about fifty miles north of La Crosse. The river furnishes a valuable water-power; and there are many flour mills, lumber mills, and other manufacturing.

**BLACK ROD**, GENTLEMAN USHER OF THE, in England, an officer of the House of Lords, appointed by letters-patent. He is chief gentleman-usher to the sovereign, and usher of the Garter, at the chapter-meetings, of which he keeps the door. He has charge of all arrangements for keeping order in

the House; takes into custody any peer guilty of breach of privilege; and (himself, or by his deputy the yeoman-usher) summons the House of Commons to the peers when the royal assent is given to bills, or when royal speeches are read. The appointment of messengers, door-keepers, etc., rests with Black Rod. His title is derived from the black rod which he carries. The name is also given to similar functionaries in the legislatures of the Dominion of Canada and other British colonies.

**BLACKSBURG**, a village of Virginia, about seventy-five miles west of Lynchburg. It is the seat of the Virginia Agricultural and Mechanical College.

**BLACK SNAKE**, a species of snake common in the United States from Louisiana to Connecticut; is of an almost uniform leaden color, is one of the largest serpents in North America, and is remarkable for its agility. It moves along the ground with a swiftness equal to that of a horse, glides over bushes, and climbs trees. It feeds on small quadrupeds, birds, frogs, etc.; frequently plunders poultry yards of eggs, and enters dairies to drink milk and cream, of which it is very fond, but compensates for these depredations by killing rats and mice. It has no poison fangs, but is not slow to bite.

**BLACKSTONE RIVER**, of Massachusetts, rises in Worcester county and empties into Providence River after having followed a southeasterly course. It measures about 75 miles, and furnishes water-power to several manufacturing villages.

**BLACKWALL**, a town of Middlesex, England, at the junction of the Lee with the Thames, four miles southeast of London; has foundries, ship-building yards, and the East and West India Docks. A railroad connects Blackwall with London, and, to avoid the dangers and delay of the "pool," many passengers proceed by this railway to embark in steamers at Blackwall instead of going on board at London Bridge.

**BLACK WALNUT**, the *Juglans nigra* of the United States. It is a handsome tree, which produces an edible nut, and is much prized for its valuable timber.

**BLACK WATCH**, the name given to the first of the Scottish Highland regiments which had its origin in a commission granted to John, second Earl of Athole, in 1668, to raise and keep a sufficient guard for securing peace in the Highlands. The term *black* arose from the dark color of their tartan uniform, which distinguished them from the regular troops, called the *Saighdean Dearg*, or "red soldiers." Originally three companies, in 1729 the number was increased to six, and these formed into the 42d Regiment under the command of the Earl of Crawford, in 1739. In 1743 the regiment joined the troops in Flanders and first went into action at Fontenoy, since which it has been one of the most distinguished corps in the British army. In 1872 the officers of the corps erected a monument in Dunkeld Cathedral in memory of those who had fallen in battle from the creation of the regiment till the close of the Indian mutiny in 1859; and a memorial cairn, raised by public subscription, was unveiled Nov. 13, 1887, in the field near Aberfeldy, where the regiment first assembled in 1739.

**BLACKWATER**, a name of five Irish rivers, one of which deserves notice—the Blackwater of Cork, which runs across Cork county in a carboniferous limestone basin. High mountains bound it on the south, and its chief feeders come from the north. It is 100 miles in length, the seventh in size of the Irish rivers. The scenery along its banks is extremely beautiful and picturesque, with ruins, mansions, and woods. It abounds in salmon.

**BLACKWELL**, ANTOINETTE LOUISA BROWN, born at Henrietta, New York, May 20, 1825, graduated at Oberlin in 1847, completed a theological course in 1850, and afterwards preached and delivered lectures on literature, temperance, slavery and woman suffrage. She has been a Congregational minister but is now connected with the Unitarian denomination and preaches occasionally. She is the mother of six children and lives in Elizabeth, N. J. She is the author of several books.

**BLACKWELL**, ELIZABETH, born in Bristol, England, in 1821. Her family emigrated to America, and, after settling in Cincinnati, Ohio, the father died, leaving his wife and nine children in great poverty. Elizabeth contributed toward the family support by teaching school. She resolved to become a physician and prosecuted her studies under many difficulties. The medical colleges of New York, Philadelphia and Boston refused to receive her, but she was at last admitted to the Geneva school in New York, from which she graduated with honor in 1849, being the first woman in America to obtain the degree of M. D. She went to Paris, where she studied midwifery. After this she was admitted to the hospital of St. Bartholomew, in London, where she studied and practiced medicine. In 1851, on her return to America, she settled in New York, and began the practice of medicine. She met with some opposition from the members of the profession, but was able to overcome it. In 1854, with the aid of her sister, Dr. Emily Blackwell, she started an infirmary for women and children. A few years later the sisters established a woman's medical college in connection with the infirmary. Dr. Elizabeth, in 1869, went to London, where she practiced medicine for several years, lectured, and assisted in forming a woman's medical college. She has written health tracts and books on hygiene.

**BLACKWELL**, LUCY STONE. See **STONE**, LUCY.

**BLACKWELL'S ISLAND**, a part of New York city; it lies in the East River, and has an area of 120 acres. On this island are charity and fever hospitals, a penitentiary, alms and workhouses, and a light-house.

**BLACKWOOD**, WILLIAM (1776-1834), a distinguished publisher, born at Edinburgh in 1776, at which place he settled as a bookseller in 1804. In 1817 he became a publisher on his own account and issued the first number of "Blackwood's Magazine." The literary ability displayed in this periodical was so much in advance of the monthly magazines then existing that from the first it was a great success, and it secured for itself a wonderful reputation. He was himself chief manager of the magazine, and conducted the whole of the correspondence connected with it until his death, in 1834. Under his sons, the Messrs. Blackwood, who succeeded him in the business, "Maga" has not only sustained but increased its reputation.

**BLACKWOOD RIVER**, in West Australia, enters the Hardy Inlet six miles northeast of Augusta. It flows through the counties of Durham and Nelson first to the west then to the south, traversing a district of wood and pasturage. It is navigable for boats to a distance of 20 miles.

**BLADDER GREEN**, and **SAP GREEN** are colors derived from the buckthorn, a genus of *Rhamnaceæ*, and in use by dyers and painters.

**BLADDER-NUT**, a genus of plants, *Staphylea*, the type of a small natural order, *Staphyleaceæ*. They are mostly trees or shrubs of elegant appearance, and the two species, *S. trifolia* and *S. pinnata*, are much used for ornamental planting. Inflated membranous capsules inclose the seeds and give the popular name to the trees. See *Britannica*, Vol. II, p. 320.

**BLADDER-SEED** (*Physospermum carabianum*), an umbelliferous weed noted for its inflated fruit.

**BLADDER-SENNA** (*Colutea arborescens*), a leguminous tree of Southern Europe, frequently cultivated. It owes its name partly to the dry inflated pod, partly to its popular use as a purgative.

**BLADDER-WORM**, the asexual stage of a tape worm or cestode. The stage owes its name to the bladder-like form resulting from the encysted embryo. See TAPEWORMS, *Britannica*, Vol. XXIII, pp. 52, 53.

**BLADDERWORT**, a genus of plants of the natural order *Lentibulaceae*, containing numerous species. Their bright blossoms, with those of the water lilies, etc., adorn the surface of lakes, ditches, and marshes in almost all parts of the world; they are particularly abundant within the tropics. The roots, stems, and even leaves are furnished with numerous little bladders, which are filled with water, till it is necessary that the plant should rise for the expansion of the flowers, when they become filled with air; and this again gives place to water after flowering is over, so that the seeds are ripened at the bottom. The bladders of some species have an orifice closed by a very thin elastic valve opening inwards; aquatic insects sometimes enter them and are imprisoned.

**BLADENSBURG**, a village of Prince George's county, Maryland, situated on the eastern branch of the Potomac, about six miles northeast of Washington. It was the scene of a battle fought Aug. 24, 1814, which resulted in the defeat of the Americans, and the capture and destruction of the city of Washington by the British.

**BLADEN SPRINGS**, a village of Choctaw county, Alabama, situated near the Tombigbee River, about eighty-five miles north of Mobile. It is noted for its copious medicinal springs. These are six in number, saline-chalybeate, and are highly valued for their curative effects in cases of dyspepsia, chronic rheumatism, and kidney and bowel complaints.

**BLAES**, a Scottish collier's name for the shale of the coal-measure, originating apparently from the "blao" or bluish color sometimes noticed in the shale. The term is occasionally used by geologists.

**BLAEU**, WILLIAM JANSZON, Dutch mathematician, map-drawer and publisher, born at Alkmaar, Holland, in 1571, died in 1638. His terrestrial and celestial globes excelled in beauty and accuracy everything that had preceded them. For description of his work, see *Globe*, *Britannica*, Vol. X, p. 683. His son, Jan, commenced business on his own account at Amsterdam in 1637, but afterwards entered into company with his brother Cornelius (died 1659). He edited the well-known *Atlas-Major* in eleven volumes. This is a remarkable work, with many curious plates; and the maps are extremely valuable from the light they throw on local history. He further published a series of topographical plates and views of towns. Jan left three sons, two of whom carried on the business with success until about 1700. Some of their classical publications, especially Cicero's *Orations* (1699), are highly prized.

**BLAGOVIESHTSCHENSK**, a town of the Amur province of Russian Asia, at the confluence of the Amur and Seja rivers. Till 1882 it was the capital of the province. Population, 7,975.

**BLAINE**, JAMES GILLESPIE, an American statesman, born of Scotch-Irish parentage at West Brownsville, Pa., Jan. 31, 1830. As a boy at school he excelled in literature and mathematics, and at the early age of thirteen entered Washington College in his native county, graduating in 1847. Sub-

sequently he became a teacher in the military institute at Blue Lick Springs, Ky., where he married Miss Harriet Stanhope, a teacher in a neighboring seminary. Soon after his marriage he removed to Pennsylvania, and after studying law for a short time became a teacher in the Institution for the Blind at Philadelphia. In 1851 he removed to Augusta, Me., entering the journalistic ranks, first as editor of the "Kennebec Journal," and later as editor of the "Portland Advertiser." In 1858 he was elected to the State legislature, and served two terms, officiating as speaker during the last two years. During the same year (1858), he was made chairman of the Republican State Committee, which office he held for a score of years. In 1862 the Republicans elected him to the House of Representatives, and for 20 years he served in one or the other of the two Houses of Congress. During the war he favored all judicious and practical resolutions for its vigorous prosecution, and at its close he bore an active part in the reconstruction measures of the country. The 14th Constitutional Amendment was called the "Blaine Amendment," as it was formulated and earnestly advocated by him. He was largely instrumental in the negotiation of a treaty with England, in which the doctrine of perpetual allegiance was abandoned, and Great Britain accepted the American principle of equal rights and protection for adopted as well as for native citizens. From 1869 to 1875 Mr. Blaine was speaker of the House of Representatives, and his record in this capacity is generally conceded to have been a brilliant one. As presiding officer he was distinguished for his knowledge of parliamentary law, his impartiality in administration, and his physical endurance. His course in connection with the general amnesty bill, which provoked stormy discussion in 1876, strengthened his influence in the Republican party.

In 1876 Mr. Blaine was elected to the United States Senate, and at once became a most prominent and efficient member of that body. In the Republican national convention of that year he was a prominent candidate for nomination to the presidency of the United States, and lacked only 28 votes out of a total of 754 of receiving the nomination. At the Republican national convention in 1880 his friends again presented his name for nomination, and on the first ballot the vote stood: Grant 304, Blaine 281, Sherman 93, Edmunds 34, Washburn 30, Windom 10, Garfield 1. On the election of Mr. Garfield, Mr. Blaine accepted the appointment of Secretary of State, filling the office with rare ability and success, until the death of the president, when he retired from active public work, and began to write his famous historical work, entitled *Twenty Years of Congress*. In 1884 Mr. Blaine received the Republican nomination for President, but after a vigorous contest, failing to secure the electoral vote of the State of New York by the narrow margin of 1,017 votes out of a total of over 1,200,000, he was defeated in the general election. He spent the ensuing four years at work on his book and in foreign travel.

At the time of the nominating convention in 1888, Mr. Blaine was in Europe, and by formal letter declined to permit his friends to present his name as a candidate for the presidency. He returned, however, in time to aid efficiently in the canvass for Mr. Harrison, and on the election of the latter again accepted the appointment as Secretary of State. Among the important services since rendered in this office he took a leading part in settling the Samoan difficulties in the treaty between Germany, England, and the United States, and successfully invited and most efficiently presided over the Pan-American Congress held in Washington. At this

writing (1891), he is actively conducting on the part of the United States the discussion with England on the Bering Sea Seal-fishery question.

BLAIR, FRANCIS PRESTON, born in Abingdon, Va., April 12, 1791, died at Silver Spring, Md., Oct. 18, 1876. He early entered political life, and in 1829 was requested by the President to establish a Democratic newspaper in Washington which should be the organ of the party. In response Mr. Blair started the "Globe," and conducted it till 1845. In 1854 he assisted in organizing the Republican party; in 1860 was a member of the Chicago convention which nominated Mr. Lincoln, and after his election had considerable influence in the administration. He went South in 1864, and through personal influence tried to effect a peace with Jefferson Davis and other Southern leaders. The "peace conference," of Feb. 3, 1865, was a result of his labors. After Lincoln's death he opposed reconstruction measures and gave his support to the Democratic party.

BLAIR, FRANCIS PRESTON, son of Francis P. Blair, born at Lexington, Ky., Feb. 19, 1821, died at St. Louis, Mo., July 8, 1875. He was a Princeton graduate and began the practice of law in St. Louis in 1843. He served in the Mexican war, was editor of the "Missouri Democrat" and from 1852 to 1856 was in the Missouri Legislature. He joined the new Republican party in 1856 and was sent to Congress. In 1862 he was reelected. In 1861 he commanded an unauthorized force which guarded the St. Louis arsenal and took the State forces under General Frost, thus saving Missouri and Kentucky from the Confederates. He fought in the civil war, and was raised to the rank of major-general. He was at Lookout Mountain, Missionary Ridge and marched with Sherman to the sea. After the war he left the Republican party, being dissatisfied with its policy, was elected to his State legislature and in the same month was elected by the Democrats to the United States Senate.

BLAIR, HENRY WILLIAM, born at Campton, N. H., Dec. 6, 1834. His parents died before he reached the age of 13, and his early educational advantages were very limited on this account, and also because of his own ill-health. He studied law and in 1860 was elected prosecuting attorney of Grafton county. He enlisted in the civil war, but at the siege of Port Hudson was so severely wounded that he was unable to engage in any further military service. He was from 1866 to 1869 in the New Hampshire legislature, and since 1875 has served in Congress. He is a reformer and introduced the important "Blair Common-School Bill." He gives his support to all such social questions as temperance and woman suffrage.

BLAIR, JAMES, educator, born in Scotland in 1656, died in Williamsburg, Va., Aug. 1, 1743. He was a clergyman of the Episcopal church and spent most of his life in the colony of Virginia. He established the William and Mary College, having gathered funds for it and secured the charter from the king. He was appointed its first president.

BLAIR, JOHN INSLEY, capitalist, born in Warren county, N. J., Aug. 22, 1802. He has been an active business man, assisting in developing coal mines in Pennsylvania, building the railroad between Owego and Ithaca, N. Y., building the Delaware, Lackawanna and Western Railroad, and also assisting in laying roads in Iowa, Wisconsin, Kansas, Nebraska, Missouri and Texas. He was one of the original directors of the Union Pacific Railroad. He is a Republican, a member of the Presbyterian church, and a liberal benefactor of educational and religious objects, having given over \$500,000 for benevolent purposes.

BLAIR, MONTGOMERY, born in Franklin county Ky., May 10, 1813, died at Silver Spring, Md., July 27, 1883. He served in the Seminole war, held several judicial positions in Missouri and Maryland, and being appointed by Lincoln to the Cabinet as Postmaster-General, he instituted various improvements in his department—notably money orders and postal railroad cars. He is said to have been the only one of the Cabinet who opposed the surrender of Ft. Sumter. After 1867 he lent his influence to the Democratic party.

BLAIR-ATHOL, a village in the county of Perth, Scotland, situated at the confluence of the Tilt and Garry. Blair Castle, the seat of the duke of Athol, is situated here. The larch-trees surrounding it are remarkable alike for their enormous size and for the fact of their being among the first planted in Scotland. See *Britannica*, Vol. XIV, p. 311.

BLAIR, a city of Nebraska, county-seat of Washington county, and an important railroad center. It is situated about three miles west of the Missouri River and thirty miles above Omaha. It has a large local trade and various important industries. It contains a number of elevators, mills, and wagon-factories.

BLAIR-GOWRIE, a village of Perthshire, very beautifully situated on the east side of a range of hills, on the right bank of the Erich, 16 miles north-east of Perth. It consists chiefly of one winding street. It has flax-spinning and weaving factories, driven by the Erich, employing 700 to 800 hands. Pure white marble is found in the vicinity. Population, 4,833.

BLAIRSVILLE, a village of Georgia, county-seat of Union county. It is noted for the marble and gold found in its vicinity.

BLAIRSVILLE, an important shipping center of Pennsylvania, situated on the Conemaugh River, about 55 miles east of Pittsburgh. Coal, lumber, grain, and pork are here shipped in large quantities.

BLAKE, EDWARD, son of William Hume Blake, born in Adelaide, Middlesex county, Ontario, Can., Oct. 13, 1833. He graduated with honors from the University College of Toronto in 1857, and two years later was called to the bar. He was simultaneously a candidate for election to the House of Commons of the Dominion and the Legislative Assembly of Ontario. To the latter body he was elected, and soon became (1867) leader of the opposition. In 1871 he became premier of the Ontario legislature, holding office for one session and then resigning. Under the Mackenzie administration Mr. Blake held successively two important cabinet positions.

BLAKE, LILLIE DEVEREUX, born at Raleigh, N. C., Aug. 12, 1835. She received her education at Miss Apthorp's school in New Haven, Conn., and afterwards took the Yale course with tutors at home. She is a prominent advocate of woman suffrage, and has frequently lectured on this subject. She takes an active part in political campaigns, and is a writer of several sketches and stories. The law giving school suffrage to the women of New York was largely due to her efforts. She was the first to ask that women be admitted to Columbia College.

BLAKE WILLIAM PHIPPS, born in New York city, June 1, 1826. He was a scientific student at Yale, and in 1853 went on a U. S. Pacific railroad expedition as geologist and mineralogist. He has edited the "Mining Magazine" (1859-60), and has been connected with explorations in Alaska, China, and Japan. In 1864 he was called to the chair of mineralogy and geology in the California College.

BLANC, ANTHONY, born in Surry, France, Oct. 11, 1792, died at New Orleans, June 20, 1860. He was a Roman Catholic archbishop. He left his native country in 1817, a year after his ordination to the priesthood, and came to the United States; was created bishop of New Orleans in 1835, and archbishop in 1850. He founded a theological seminary, introduced several religious orders into his diocese, visited Rome, founded colleges, academies for young ladies, free schools, convents and orphan asylums.

BLANC, AUGUSTE, a French art critic, brother of Jean Joseph Louis, born at Castres in 1813, died in 1882. His contributions to various French periodicals, on matters connected with art, were numerous. He was the editor and principal writer of the very complete and extensive *History of the Painters of all the Schools*. His *Works of Rembrandt* has passed through many editions. He was director of Fine Arts in 1848 and in 1871.

BLANC, JEAN JOSEPH LOUIS (1811-82), French Socialist and historian, born Oct. 29, 1811, at Madrid, where his father was inspector-general of finance under King Joseph. After finishing his school education he went to study in Paris. For two years he was a private tutor at Arras, and in 1831 returned to Paris, where he contributed to various political papers, and where in 1839 he founded the *Revue du Progrès*, in which he first brought out his chief work on Socialism, the *Organisation du Travail*, which in 1840 appeared in a separate form. The book asserts that in the existing order of society the spread of education among the masses would be dangerous—would, in fact, be impossible. It denounces the principle of competitive industry, and proposes the establishment of social workshops, composed of workmen of good character, and subsidized by the state. The book obtained for its author a wide, enthusiastic popularity among French workmen. Next, in 1841-44, Blanc published an historical work, entitled *Histoire de Dix Ans* (1830-40), which produced a deadly effect on the Orleans dynasty. It owed its success partly to the exposure it made of the immorality of the crown and its advisers, partly to that passionate ardor which changed the tranquillity of history into the vehemence of a pamphlet. This was followed by the first volume of a *Histoire de la Révolution Française*. On the breaking out of the revolution of February, 1848, his popularity with the working classes led to his appointment as a member of the Provisional Government, and he was placed at the head of the great commission for discussing the problem of labor, which had its sittings in the palace of the Luxembourg. He was accused of a share in the disturbances of the summer of 1848, and made his escape to London, where he spent many years. During his exile he devoted himself to political and historical literature. He completed his *Histoire de la Révolution Française*, and carried on a large correspondence for the French journals. On the fall of the Empire Blanc returned to France, and was elected to the National Assembly in 1871. After 1876 he was member of the chamber of deputies. He died at Cannes, Dec. 6, 1882.

BLANC, LE, a thriving town of France, in the department of the Indre, situated on the Creuse. Above Le Blanc the river expands so as to form a lake, but at the town it contracts, and breaks into cascades with sufficient fall to turn the machinery of several manufactories. It has linen-yarn and cloth-mills, potteries, tanneries, vinegar-works, forges, etc. It is very ancient, having been frequented by the Romans. Population, 6,000.

BLANCH, or BLEXEN-HOLMSE, one of the ancient feudal tenures in the law of Scotland relat-

ing to land, the duty payable to the superior or lord being in general a trifling sum, as a penny Scots, or merely illusory, as a pepper-corn, 'it asked only.' Anciently many estates in Scotland were held, both by the crown and other superiors by this tenure. It is now seldom adopted in the constitution of an original right of property.

BLANCHARD, THOMAS, born at Sutton, Mass., June 24, 1788, died at Boston, April 16, 1864. He was an inventor, and some of his inventions were a new method of making tacks by machinery, a machine for turning and finishing gun-barrels, and an improved form of steamboat to be used for ascending rivers which have a rapid current. He also invented a steam wagon (before any railroad had been built), a method for bending heavy timber, and a machine for cutting and folding envelopes.

BLANCHING, a process resorted to by gardeners to avoid certain secretions which in ordinary circumstances take place in the leaves of plants, and to render them more wholesome for food. Blanching is accomplished in various ways, as by drawing up earth to the plants when the lower part of the leaf or leaf-stalks alone is to be blanched; tying the leaves together, by which the inner ones are blanched, as is commonly done in lettuce, etc. Blanching, although so simple and easy, is of great importance in the art of gardening, and the usefulness of many plants very much depends upon it. In cabbage and some other plants, the leaves form themselves into compact heads, and there is a natural blanching or etiolation.

BLANC-MANGE (Old French, *blanc manger*, "white food"), a dish formerly made of fowl, meat, eggs, etc.; now a name of different preparations composed of dissolved isinglass, arrow-root, corn-starch, etc., with milk and flavoring extracts.

BLANCO, CAPE, a remarkable headland on the west coast of Africa, the extremity of a rocky ridge, (called Jebel-el-Bied), which projects from the Sahara in a westerly direction, and then bending southward forms a commodious harbor, called the Great Bay. Southward to the mouth of the Rio Grande the shores are of a sandy character, with a current tending southwest, and prevalent northeast trade-winds. On account of the deficiency of good harbors, the prevalence of west winds, and other causes, the casualties to shipping are very numerous. The natives of the Canary Islands carry on a pretty lucrative fishery in the bay in boats of from 100 to 150 tons burden. Cape Blanco, which is composed of mixed calcareous and siliceous sandstone, was first discovered by the Portuguese in 1481.

BLAND, a beverage which is a common drink among the inhabitants of the Shetland Islands during the summer months. It has been described as being perfectly good and transparent when a year old, its flavor then bearing a strong resemblance to that of lemon juice.

BLANDFORD-FORUM, a town in Dorsetshire, England, on the right bank of the Stour, sixteen miles northeast of Dorchester. It lies on a fine tract of pasture-land, famed for its multitude of cows. It is built of brick, and is neat and regular. It has manufactories of shirt buttons, and was formerly famed for its manufactures of band-strings, and point-lace. Population, 4,110.

BLANDRATA, Giorgio, founder of Unitarianism in Poland and Transylvania, born in Saluzzo, Italy. He established himself as a physician at Padua, but, on account of his heretical opinions, he was compelled to fly to Geneva in 1556. He went to Poland in 1558, hoping to find a greater freedom for thought and speech. In 1563 he

became the favorite physician of John Sigismund, prince of Transylvania. Here he spread his doctrine, and formed a considerable party. He was murdered in 1590 by his nephew, whom he had threatened to disinherit for his attachment to the Roman Catholic Church.

BLANKENBERGHE, a village on the coast of West Flanders, nine miles north of Bruges by rail. It has a harbor and a light-house, and the place is a popular summer resort. Population, 3,328.

BLANKENBURG, a town in the duchy of Brunswick, situated on the Harz mountains. It is walled, has a gymnasium and several charitable and educational institutions. Mining is the chief industry, iron, marble and dye-earths being abundant in the surrounding districts. Population, 3,600. On the lofty summit of Regenstein, half a mile distant, are the remains of a large castle, hewn out of the rock by Henry the Fowler in 919. Louis XVIII resided at Blakenburg, as Comte de Lille, from 1796 to 1798.

BLANKETEERS, the name applied to a body of Manchester operatives, who on March 16, 1817, met in St. Peter's Field, intending to march thence to London with a petition for parliamentary reform. Each man of the company had a rug or blanket strapped on his shoulders, so that he might bivouac on the road if necessary.

BLANK VERSE, a verse without rhyme and depending on meter alone. The classical productions of the Greek and Roman poets are composed on this principle. When the passion for imitating classical models set in, rhyme came to be looked upon as an invention of Gothic barbarism, and attempts were made in most countries to shake it off. The Italian and Spanish writers used blank verse as early as the beginning of the sixteenth century. The first blank verse in English is a translation of the second and fourth books of Virgil's *Æneid*, by the Earl of Surrey, who was executed in 1547. Its adaptation to the drama was at once felt, and it soon became and has continued dominant in that department; but in other kinds of poetry it was not till the appearance of *Paradise Lost* (1667) that it could be said to have taken root, and even then the want of rhymes was felt, as the poet expected it would be. Many poets have since followed Milton's example. Some would restrict the name to lines of ten syllables, not considering it applicable to such metres as Southey's *Thalaba* and Longfellow's *Hiawatha*. In Italian and Spanish it never became popular, still less in French. The German language seems to admit every variety of blank metre.

BLANQUI, JEROME ADOLPHE, one of the first French economists, born at Nice in 1798, died at Paris in 1851. He was educated at the Lyceum of Nice, which city his family quitted in 1814, and he went to Paris to complete his studies. In 1825 he was appointed Professor of History and of Industrial Economy in the Commercial School at Paris. In 1838 he became a member of the Academy of Moral and Political Science. The Academy sent him to Corsica to study the condition of that country, and afterwards to Algiers and Turkey. He was requested to furnish a complete account of London in its financial and other aspects. This task he executed to the satisfaction of the *sarans* who employed him. The Academy highly valued his abilities. In method he was ingenious, in style transparent, and even dry. Discussions became interesting from his lively mode of treating them. As a national economist he was somewhat inclined to Socialism; he was also in favor of free-trade. He wrote some excellent works on Political Economy.

BLANQUI, LOUIS AUGUSTE, brother of the preceding, born at Nice in 1805, died in 1880. He made himself conspicuous chiefly by his rabid advocacy of most extreme political opinions, which eventually led to his being condemned to ten years' imprisonment in Belleisle.

BLAPS, a genus of insects of the order *Coleoptera*, the type of a tribe called *Blapsides*. The species are numerous, of a dark color, destitute of wings, and have the elytra or wing case united. They inhabit dark and damp places, and feed chiefly on dead vegetable matter. They have the power of secreting and emitting a brownish acid, irritating fluid of a peculiar and penetrating odor, with which they appear to be furnished for the purpose of self-defense.

BLÄSER, GUSTAV, a German sculptor, born at Dusseldorf in 1813. He is best known in this country by his bust of Humboldt in Central Park, New York. Other principal works are his colossal statue of Prussia, in Berlin, and his equestrian statues of Frederick William III and Frederick William IV.

BLASPHEMY. See *Britannica*, Vol. III, p. 807. In the United States, blasphemy has been made the subject of statutory enactments by several of the individual States. These enactments, however, are little more than confirmations of the common law and the older statutory laws of England. Profanity is generally classed by these State laws with blasphemy as an indictable offense.

BLASTING. See *Britannica*, Vol. III, pp. 808-11. See also *EXPLOSIVES*, in these Revisions and Additions.

BLASTODERM, an embryological term applied to the layer or layers of cells arising from the germinal disc, or the portion of a partially segmenting egg which undergoes division. In ova where there is a large quantity of nutritive material or yolk, as in fish or bird, the whole ovum cannot divide, and only a small (germinal) disc of "formative protoplasm" does so. The cells resulting from the division of this area become afterwards disposed in the ordinary germinal layers, and are in their earlier stages, as they grow round the yolk and become in their area of origin the seat of embryonic development, called the blastoderm.

BLAVATSKY, HELENE PETROVNA, theosophist, born in Russia about 1831. Col. Peter Hahn is her father, and Gen. Nicephore V. Blavatsky, deceased, a former governor of Armenia, was her husband. She has studied the mysteries of Buddhism in a Himalayan retreat, has published *Isis Unveiled*, and has founded the Theosophical Society, of which Col. F. P. Olcott is president, and Madame Blavatsky the secretary. She died in 1891.

BLAYE, a fortified seaport of France, in the department of the Gironde, twenty miles from Bordeaux. It is defended by two forts. The port of Blaye is a very busy one, all inward bound vessels being required to anchor and deliver the manifests of their cargoes, and many outward bound lay in their provisions here. It has manufactories of linen and woolen, glass and earthenware, a considerable export trade in corn, wine, brandy, oil, fruits, soap, etc., and tribunals of jurisdiction and of commerce. It has a strong modern citadel, theater, hospital, agricultural society, etc. Population, 4,765.

BLAZON, BLAZONRY, heraldic terms originated in the custom of blowing a trumpet to announce the arrival of a knight, or his entrance into the lists at a tournament. The blast was answered by the heralds, who described aloud and explained the arms borne by the knight. It thus came to signify the art of describing the objects, their

positions, gestures, tinctures, etc., and the manner of arranging them on the shield.

BLEACHING. See *Britannica*, Vol. III, pp. 811-23.

BLEAK, a small fresh-water fish of the family of *Cyprinidae*, of the same genus with the Dace, Minnow, etc. It is six or seven inches long, the nose is pointed, and the under jaw is longer than the upper; the scales are beautifully striated, the back an olivaceous green, and the sides, cheeks, and gill-covers silvery white. The tail is forked for half its length. On the inner surface of the scales a silvery substance is found in such abundance as to be much used for making artificial pearls, the white heads so common in many ornaments. It is not only a pretty fish, but is also much prized for the table.

BLED SOE, ALBERT TAYLOR, born in Frankfort, Ky., Nov. 9, 1869, died in Alexandria, Va., Dec. 8, 1877. He graduated at West Point, served on military duty in the Indian Territory, followed the teaching profession at Kenyon and subsequently at Miami, studied theology and preached for various churches (1835-38), studied and practiced law (1838-48), taught mathematics in the University of Virginia (1854-61), entered the Confederate army, and was made chief of the war bureau. In 1866 he began the publication of the "Southern Review," the organ of the Methodist Episcopal Church in the South. He wrote for various publications and published several books.

BLEIBACH, a town of Austria, in the province of Carinthia, pleasantly situated in the valley of the Drave, near the celebrated Bleiberg (Lead Mountain). The inhabitants are chiefly engaged in mining, and in washing and smelting the ore, of which from 1,500 to 1,800 tons are annually obtained. Population, 5,600.

BLÉNDE, a name applied to a number of minerals composed chiefly of sulphur and certain metals, almost all of splendid lustre, but more exclusively to garnet or zinc blende. It is abundant in primitive and secondary rocks in many parts of the world, and is often associated with galena or lead-glance. It contains about sixty-six parts of zinc and thirty-three of sulphur. See *Britannica*, Vol. XVI, p. 392; Vol. XXIV, p. 785.

BLÉNEAU, a village in the French department of Yonne, situated twenty-nine miles southwest of Auxerre. Here Turenne gained a victory over the Prince de Condé in 1652.

BLÉNHEIM, capital of Marlborough district, New Zealand, situated on the Wairarua River, near the coast, twenty miles south of Picton by rail. Population, 3,094.

BLÉNHEIM DOG, or Marlborough Dog, a small spaniel, much resembling the King Charles breed in form and general appearance, but differing in the color, which is white, with orange or flamed-colored markings. In weight it should not

exceed five pounds. The Blenheim spaniel is the *Pygme* of Buffon. It derives its English name from Blenheim Park, in Oxfordshire, where the breed was a favorite one from the beginning of the eighteenth century.

BLÉNNY, a genus of acanthopterygious fishes, the type of a family, *Blenniidae*, of which the sea-wolf is the largest example. See *Britannica*, Vol. XXI, p. 614. The blenny is remarkable for the abundance of slimy matter which covers the skin. Many are destitute of scales. They have only one dorsal fin. Living in shoals which do not consist of great numbers, and frequenting rocky coasts, they are often found in pools left dry by the tide, or even among sea-weeds. They possess the power of using their ventral fins to aid them in moving about. Many of them retain their eggs within the oviduct until they are hatched, so that the young may be capable of seeking food for themselves. See *Britannica*, Vol. XII, p. 690.

BLÉNNORRHOEA, in pathology, a term applicable to a copious discharge from any mucous surface, but usually restricted to discharges from the genito-urinary mucous membrane.

BLÉRE, a town of France, in the department of Indre-et-Loire, situated on the left bank of the Clère, which is crossed by a bridge, said to owe its origin to Henry II. of England. In its vicinity is the castle of Chenonceaux, the residence purchased by Henry II. of France, for the celebrated Diana of Poitiers. The castle escaped the fury of the Revolution, and is still in a good state of preservation. Among the curiosities shown to the visitor is the mirror used by Mary Stuart (Queen of Scots) on her marriage with the Dauphin. Population, 3,561.

BLETCHINGLEY, a town of Surrey, 20 miles south of London. From 2,000 to 3,000 tons of Fuller's earth are raised annually near Bletchingley. In cutting the railway tunnel the fossil bones of the iguana, an extinct reptile, were found here; also many Roman coins have been found in the vicinity. Population about 2,000, chiefly agriculturists.

BLETS, decayed spots in apples, pears and other fruits. This decaying is often called *bletting*. It takes place chiefly by the decomposition of the protein compounds which the fruits contain, and the fermentation of the sugar; carbonic acid is formed, and by the microscope there may be discovered the fibers of a fungus pervading the bletted part.

BLIGH ISLANDS, that portion of the Feejee archipelago originally discovered by Tasman in 1643, and seen by Captain Bligh, of the *Bounty*, during his wonderful voyage in an open boat. The group lies in nearly 180° of longitude, and 15° 30' south latitude.

BLIGHT. See *FUNGUS*, *Britannica*, Vol. IX, pp. 827-36. See also *MILDEW*, Vol. XVI, pp. 293-94.

BLIND, BOOKS FOR THE. For general article on the BLIND, see *Britannica*, Vol. III, pp. 826-33. The first printed book for the blind was brought out in 1784 by M. Valentine Haüy, of Paris, the founder of the *Institut des Jeunes Aveugles*, the institution for blind children. The book was printed in raised type, the italic letter or written form of Roman letter being used. Haüy cast fonts of types, which were approved by the French Academy of Sciences, and exhibited them to the royal family at Versailles, the new art producing a great sensation.

Mr. James Gall, of Edinburgh, saw specimens of Parisian type in 1826, and resolved to print a Bible for the blind. Being a printer and publisher, he

endeavored to improve the type. His first "book" was brought out in 1827 in a triangular modification of the common alphabet, of which the following is a specimen:

BEKOLD the LAMB OF GOD

Later, Gall brought out other volumes in serrated letters, of which the following is a specimen:

Bekold the Lamb of God

The following is a specimen of the type used in 1834 by Dr. Samuel G. Howe, of Boston, and this was the style of letter used later by the American

lower rows, as in "d," add the suffix in the upper row. The following is the complete alphabet of capitals, as given by Mr. Wait in his "New York" system:

|       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|
| A     | B     | C     | D     | E     | F     |
| • • • | • • • | • • • | • • • | • • • | • • • |
|       | H     | I     | J     | K     | L     |
| • • • | • • • | • • • | • • • | • • • | • • • |
| M     | N     | O     | P     | Q     | R     |
| • • • | • • • | • • • | • • • | • • • | • • • |
| S     | T     | U     | V     | W     | X     |
| • • • | • • • | • • • | • • • | • • • | • • • |
|       | Y     | Z     |       |       |       |
|       | • • • | • • • |       |       |       |

Mr. Wait's system furnishes a list of *word* and *part-word* signs, and also signs for *numerals* and *punctuation marks*, as follows:

## WORD AND PART-WORD SIGNS.

|       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|
| the   | and   | of    | that  | ing   | ch    | ou    |
| • • • | • • • | • • • | • • • | • • • | • • • | • • • |

Apo-trophe, • • • Asterisk, • • •

Hyphen, • • • Quotation, • • •

Interrogation, • • • Dash, • • •

Parenthesis, • • •

Writing for the blind is done by means of a style which, being pressed vertically on prepared paper laid over "dot grooves" in a tablet, thus forming on the under surface of the paper the desired raised signs. In order to secure neatness, exactness, and despatch in writing a piece of apparatus was invented by Mr. Wait called a "guide," and partially shown in the accompanying cut. It consists of two metallic tablets fastened together with hinges at one end. The upper one, fully illustrated in the cut, is substantially a frame with three rows of rectangular openings, each sufficiently wide to include two rows of dot signs, or one full line of sign letters. The under tablet, not shown in the cut, contains six parallel rows of dot grooves so arranged that all the grooves, when the upper frame is shut down, will be directly under the corners of the rectangular open spaces. The paper being placed between the tablets and the latter closed, the writer, with the style in hand, presses the prepared paper into the grooves so as to make the raised letters beneath.

n o i t u t i t s n i

The writing is executed from *right to left*; so that the "raised" letters, which at first are on the under side, may read correctly from *left to right*. Thus in the cut the word "Institution" appears as written backward; but when completed, and the paper turned for the reader, it appears thus:

I n s t i t u t i o n

This New York system of writing and reading for the blind is rapidly winning its way in many sections of the United States, and has also been successfully introduced into several other countries. Its principal publishing house is in Louisville, Ky., from which numerous publications for the blind have issued—books for schools (primary and graded, including those for academic classes); books for home miscellaneous reading, and books for students in music. The writer of these paragraphs has now on his table a volume entitled *A Practical System of Tangible Musical Notation and Point Writing and*

*Reading for the Use of the Blind*, by William B. Wait, and also a copy of the current series of *International Sunday-School Lessons for the Blind*, sent out monthly by the publishing house in Louisville, for the supply of the blind pupils in Sunday Schools.

Experienced teachers report that nearly all pupils, older or younger, learn to read the point system with remarkable facility. A single illustration is here given: A gentleman in middle life, blind from early childhood, while making a recent call at the New York Institution for the Blind, expressed with a sigh his regret that he had not been able to learn to read with any satisfactory facility. On learning that he had not tried the point system, the superintendent asked leave to give him a brief lesson. This was done, and in fifteen minutes the blind gentleman (40 years of age) had not only learned the alphabet but how to use it, and with joyous gratitude received a book for his own instructive reading on the journey which he was making to a distant town.

**BLIND, KARL**, an eminent German politician, born at Mannheim in 1820. He was prominent as an agitator in connection with the revolutionary movements of 1848 and 1849, and in 1852 he fled to England. He was pardoned by the government, and in 1867 he returned to Germany. He is known in this country as a contributor to magazines and reviews, and as a zealous opposer, for many years, of the policy of Bismarck.

**BLINDAGE**, in military language, a screen made of trees or earth and timber used to protect from the enemy's fire men at work in a trench.

**BLIND-STORY**, in mediæval church architecture the triforium, a term properly restricted to examples having no exterior windows, as opposed to the clerestory of a church, which supplied the light for the interior.

**BLIND-WORM**, or **SLOW-WORM** (*Anguis fragilis*), a limbless lizard in the skink family. See **LIZARD**, *Britannica*, Vol. XIV, p. 735.

**BLISS, PHILIP PAUL**, singing evangelist, born in Clearfield county, Pa., July 9, 1838; killed in the railroad disaster at Ashtabula, Ohio, Dec. 29, 1876. He had but little education, but his fondness for music led him to gain what knowledge he could of this art by attending conventions and the Academy of Music at Geneseo, N. Y. After the war, to which he was drafted in 1864, he held musical conventions and composed numerous songs. He became acquainted with D. L. Moody and was persuaded to devote his life to evangelical work. His labors were in constant demand throughout the United States and Canada. He was a man of considerable personal magnetism, was a ready speaker and possessed a sweet sympathetic voice in singing. His singing was not scientific, but exerted a powerful influence on a miscellaneous audience. He published several collections of songs. Among his most famous songs are *Hold the Fort, Pull for the Shore*, and *Down Life's Dark Vale We Wander*.

**BLIZZARD**, a fierce storm of bitter frosty wind, with fine blinding snow, in which, especially in the Western States of the American Union, man and beast often perish. In one which visited Dakota and the States of Montana, Minnesota, Nebraska, Kansas and Texas in January, 1888, the mercury fell within twenty-four hours from 74° above zero to 28° below it in some places, and in Dakota went down to 40° below zero. In fine clear weather, with little or no warning, the sky darkened and the air was filled with snow, or ice-dust, as fine as flour, driven before a wind so furious and roaring that men's voices were inaudible at a distance of six feet. Men in the fields and children on their way from school died ere they could reach shelter; some of them having been not frozen, but suffocated from the impossibility of breathing the blizzard. Some 235 persons lost their lives. This was the worst storm since 1864; the Colorado River in Texas was frozen with ice a foot thick, for the first time in the memory of man. Really disastrous blizzards are rare, those of 1836, of December, 1863, January, 1866, January, 1873, being, till that of 1888, the severest on record. The word is a popular formation, originating in the United States, and seemingly akin to *blast*, *bluster*. The term was in colloquial use in the West early in the century, but first became usual throughout the United States during the severe winter of 1880-81.

**BLOCK, MAURICE**, statistician, born at Berlin, of Jewish family, Feb. 18, 1816, and studied at Bonn and Giessen. He settled at Paris, where for a time (1852-62) he held a post in the statistical bureau. He has published many works on the statistics of France and Europe, including the *Annuaire de l'Économie Politique et de Statistique*.

**BLOCK-HOUSE**, an edifice constructed of hewn timber sufficiently thick to be bullet-proof, and provided with loopholes for musketry. A block-house may be of one or more stories and of any size and shape. When of more than one story, the upper is made to project over the lower to enable the occupants to fire through loop-holes in the floor. In localities where timber is plentiful, and an artillery attack not to be feared, it forms a useful defensive work, and under these conditions it is often used in a rough country. When a block-house stands alone it constitutes an independent fort, and forms a barrack for its garrison.

**BLOCK ISLAND**, formerly called Manisees, situated in the Atlantic about nine miles south of Rhode Island, to which it belongs. It is about eight miles in length, has a light-house at its north end, and contains New Shoreham, a summer resort.

**BLOCKSBERG**, the name given to various mountains and hills in Germany, but preëminently to the Brocken, the highest of the Harz mountains. According to the popular belief, it is the favorite haunt of the witches, where they celebrate *Wal-purgisnacht* on the 1st of May. Almost all mountains thus haunted are known to have been famous places of sacrifice in the ages of paganism.

**BLOCK-SHIP**, a ship of war too old or too slow in sailing to render efficient service in action out at sea, but useful as a defense in great ports and naval arsenals. Now as war steamers have come more into use, some of the old sailing men-of-war are nearly valueless except as block-ships. There are at present a great number of English block-ships.

**BLOCK TIN** is an inferior variety of tin. When the metal is reduced from its ores it is first poured into moulds, and the ingots thus procured are heated to incipient fusion in a reverberatory furnace. The pure tin first fuses, and is withdrawn; and the less pure tin, which is left behind, being melted at a higher temperature, is poured into moulds and is known as block tin.

**BLOEMFONTEIN**, the capital of Orange Free State, South Africa, situated on the Modder, 200 miles northwest of Durban. It is connected by telegraph with the Cape and Natal.

**BLOEMMAERT, PHILIP**, a prominent Flemish author, born in Ghent about 1809, died there Aug. 14, 1871. In 1834 he published a volume of verse, characterized by much simplicity and earnestness, but so inartistic in form that it met with little success. He rendered better service to literature and to the patriotic cause by the publication (1836-41) of several old Flemish poems of the 12th, 13th and 14th centuries. His most important work is a *History of the Belgians* (1849), in which he attempts to show that the political destiny of the Low Countries has ever been identical with that of Germany, and that it is with the latter country and not with France that Belgium should seek to ally herself.

**BLONDEL**, a celebrated French minstrel of the 12th century, and the favorite of Richard the Lion-heart, king of England. A few of Blondel's poems are preserved in the Library of the Arsenal of Paris.

**BLONDIN, EMILE GRAVELET**, born in France about 1830. He is a famous tight-rope walker. He crossed the Niagara River below the falls on a rope 1,300 feet long, which was stretched 150 feet above the water, and has performed other similar feats.

**BLOOD, AVENGER OF**. In the early ages of society it was almost universally looked upon as the duty of the next of kin to avenge the death of a murdered relative; but among some primitive peoples, for example, the modern Bedouins, as among the ancient Anglo-Saxons, the right is an-

milled by compensation. The Mosaic law did not set aside this universal institution of primitive society, but placed it under regulations, prohibiting the commutation of the penalty of death for money, and appointing cities of refuge for the involuntary manslayer. The nearest relative, whose duty it was to hunt down the murderer, was called *Göel*, the "redeemer" or "avenger."

**BLOOD-BIRD**, or **SOLDIER-BIRD** (*Myzomela sanguinolenta*), a beautiful little species of honey-sucker. The head, breast and back of the male are of a beautiful scarlet color. It inhabits the thickest of New South Wales and also of Bengal. See *Britannica*, Vol. XII, p. 139.

HONEY-EATER.

**BLOOD-EATING**. The eating of blood was prohibited under the Old Testament dispensation, obviously for reasons connected with the use of animals for sacrifice.

**BLOOD-FLOWER** (*Hemeranthus*), a genus of bulbous-rooted plants of the natural order *Amoryllidæ*, mostly natives of South America. The beautiful red flowers form a fine cluster. The fruit is a berry, usually with three seeds; the leaves are almost linear in some and round or erect in others. The species of blood-flower generally possess poisonous properties. The inspissated juice is used by the natives of South America for poisoning their arrows.

**BLOOD-MONEY**, a reward for bringing about the death of another, as by giving evidence leading to a conviction in a capital charge. The name is also applied to the compensation formerly, and still in some countries, paid to the next of kin for the slaughter of a relative.

**BLOOD OF OUR SAVIOUR**, an order of knighthood in Mantua, instituted by Duke Vincent Gonzaga in 1608. It consisted of 20 knights. The collar had threads of gold laid on fire, and interwoven with the words *Domine probasti*. To the collar were pendent two angels, supporting three drops of blood, and circumscribed with the motto, *Nihil ista trist recepta*. The name originated in the belief that in St. Andrew's Church, in Mantua, certain drops of our Saviour's blood are kept as a relic.

**BLOOD-WORM**, a name given to the abundant aquatic larva of a goat-like dipterous insect known as *Chironomus plumosus*. It has a worm-like appearance, a blood-red color, and is found in stagnant water.

**BLOOM**, an appearance on paintings resembling in some measure the bloom on fruit, such as peaches, plums, etc., produced, in all probability, by the presence of moisture in the varnish, or on the surface of the painting when the varnish is laid on. The bloom often destroys the transparency, and is consequently injurious to the general effect of the picture.

**BLOOMER**, AMELIA JENKS, born in Homer, N. Y., May 27, 1818. She was the wife of Dexter C. Bloomer, a lawyer of Seneca Falls, N. Y. She has been a writer on enfranchisement of women, and lectured on this subject and on temperance. She published a paper, "The Lily," in 1849, which advocated her views, and in 1853, she continued its publication in Mt. Vernon, Ohio, whither she and her husband had removed. They went to live at Council Bluffs, Iowa, and she sold the paper to Mary B. Birdsall. She adopted and advocated the

Bloomer costume (consisting of a skirt reaching to the knees, and Turkish drawers), which was originated by Gerrit Smith's daughter, Mrs. Elizabeth Smith Miller. She formerly took an active part in the woman suffrage movement in Iowa and Nebraska, but has entirely withdrawn from public life of late years.

**BLOOMER COSTUME**, a dress or costume for women which arose out of an agitation for the reform of female attire. In 1849 Mrs. Bloomer named the costume to which she has given her name, and lectured in New York and elsewhere on its advantages. The Bloomer dress consisted of a jacket with close sleeves, a skirt falling a little below the knee, and a pair of loose trousers buttoned at the ankle. Though a few ladies followed the example of Mrs. Bloomer, the dress was never popular. Dress reform societies and private persons have from time to time advocated changes in the costume of women less radical than Mrs. Bloomer's, and the "divided skirt" has still its supporters.

**BLOOMFIELD**, a city of Iowa, county-seat of prairie county, beautifully situated on an elevated site about 85 miles west of Burlington. It is enjoyed center of a fertile agricultural district, contains excellent educational facilities, and contains important manufactures of furniture, plows and wagons.

**BLOOMFIELD**, a manufacturing town of New Jersey, situated on the Morris Canal, about five miles northwest of Newark. It contains a cabinet-factory, an iron foundry and manufactures of paper and woolen goods.

**BLOOMINGTON**, a city of Illinois, capital of McLean county, situated nearly in the geographical center of the State and surrounded by one of the great agricultural regions in the world. Four every-day lines of railway furnish an outlet in every direction. The city is located on the highest land in the State, and its systems of sewerage, gas and water mains are very extensive. The streets are paved with trees, and well lighted with gas and electricity. Electric street cars radiate from a central point to all parts of the city. The furnish daily is from subterranean sources, which strongly impregnated with iron, and high claims are made for its healthfulness.

Bloomington carries on a large wholesale trade, and its manufacturing industries are numerous. The Chicago manufacturing industries are numerous here, and at Alton Railroad shops are located here, and employ over 2,000 men. The city is the means of education are ample, there being numerous public and private schools, and a large public library. The Illinois Wesleyan University was founded here in 1857. The Major Female College and the Roman Catholic Academy are also located in the city, while at Normal, two miles distant, is the State Normal University, organized in 1857, with an endowment of \$200,000. The State Soldiers' Home is also located at Normal. The population of the city was, in 1880, 17,180; in 1890, 22,242.

**BLOOMINGTOWN**, a city of Indiana, county-seat of Monroe county, situated about 55 miles southwest of Indianapolis. It is the seat of the Indiana State University. It contains extensive manufactures of woolen goods, staves and leather. There are also extensive quarries of hard wood, stone, and in the vicinity of limestone.

**BLOOMSBURG**, a flourishing railroad town of Pennsylvania, situated on the northwest of Scranton, situated on Fishing Creek. It contains 10 churches, three banks, iron foundries; it is the

seat of a State normal school, and the county-seat of Columbia county.

**BLOUSE**, a name borrowed from the French for a loose, sack-like over-garment. In England it is worn by wagoners and farm-laborers, and is called smock-frock. In the south of Scotland it is sometimes worn by butchers, and is then blue, as in Germany and France. In Germany it is frequently tightened to the body by a belt, and sometimes made of coarse woolen. France is preëminent in the country of blouses. There they are worn universally, not only by the country people, but also by the laboring classes in towns, not excepting Paris; and so characteristic is this garment that the French populace are often called the "blouse." The white blouse is Sunday dress with the work of class in France. In America it is a coat made of any material, as for instance the undress uniform of the United States army.

**BLOW-FLY**, a two-winged insect, of the order *Diptera*, and of the large family *Muscidae*. Its body is hairy, the face silky and yellow, the thorax gray with three black stripes, the abdomen white with glittering yellow spots. The eyes are placed separate in both sexes. The eggs are often deposited within the body of the parent, and its larva live found feeding upon meat, sometimes upon worms, and too often upon sheep.

**BLOW-PIPE AND ARROW**, a kind of weapon, much used by the Indians of South America long in war and for killing game. It consists of a straight tube, in which a small poisoned dart is placed, and forcibly expelled by the breath. The tube or blow-pipe is eight to 12 feet long, and of reed, or the stem of a small palm. In the hands of a practiced Indian it is a deadly weapon, especially when directed against birds in the tops of tall trees. As the weapon makes no noise, the hunter often empties his quiver before he gets his game.

**BLUEBEARD**, the name given to the French or well-known tale of fiction, which is of the Chevalier type. According to this romance the hero gets his Kaoul has a blue beard, from which the Chevalier designation. The historic original of Raoul. Raoul appears to be Gilles de Laval. He fought valiantly who was marshal of France in 1420, and invaded by France, and died in the defense of his country when dressed in the English; but his cruelty and wickedness seem to have eclipsed even his bravery, as tradition has bequeathed chiefly for his crimes, which are painted in the blackest and most fearful colors. Laval was burned alive in a field near Nantes in 1440.

**BLUE BIRD** (*SIALIA*, or *SYLVIA*), a favorite American bird, displaying great confidence and familiarity in approaching the habitation of man. The male robin. The and in its general manner resembling, beautiful sky-blue upper parts of the blue-bird are of a reddish chestnut color, the throat and breast are a soft agreeable blue and the belly white. Its song is a soft, sweet warble. It lays five or six pale blue eggs, and has two or three broods in the season. It is several different.

**BLUEBELL**, the popular name given to the bell-shaped plants. In England the name is given to the common wild hyacinth, *Scilla nuttalliana rotundifolia*, bluebells are flowers of *Campanula*. The term is commonly called bellflower elsewhere plants having also occasionally applied to other blue bell-shaped flowers.

**BLUE-BOOKS**, the name pointed by order of the reports and other papers printed by the British Parliament, because the practice of printing them up in blue covers. The first printed proceedings and to some extent published in the year 1681, of the House of Commons, began.

when disputes ran high on the question of excluding the Duke of York from the succession to the throne. It was stated that false accounts of the transactions were circulated, and it was decided as a remedy that the proceedings of the House be printed. The documents printed by the House of Commons accumulated gradually in bulk and variety until now the blue-books of a session, when collected and bound up, fill many thick folio volumes. The corresponding official books are yellow in France, white in Germany and Portugal, green in Italy, and red in Spain. In the United States the term is applied to a book containing the names and salaries of all the persons in the employ of the Government.

**BLUE-BOTTLE FLY** (*Musca vomitoria*), an insect of the same genus with the common house-fly. The head is black, with rust-colored cheeks, the thorax grayish, the abdomen blue, with a whitish shimmer, and with three black bands. The expanse of wings is nearly one inch, and it flies with a loud buzz. It is abundant throughout Britain and Europe. *M. erythrocephala* is also called blue-bottle.

**BLUE-COAT SCHOOL**, the name usually given to Christ's Hospital—a school in London founded by Edward VI—where the boys wear the ancient costume, of which a blue coat or gown forms a part.

**BLUE-EYE** (*Entomyza cyanotis*), a beautiful little bird of New South Wales. A species of honey-sucker, it seeks its food among the blossoms and small leafy branches of the eucalypti. Numbers are often seen hanging in clusters at the extreme ends of the branches, bending them down with their weight.

**BLUEFISH** (*Pomatomus saltatrix*), a fish of the family *Pomatomidae*, also called *Blue-snapper* and *Skipjack*. It is of compressed subfusiform shape, having two dorsal fins, the first of which is small, and two deeply-hidden spines in front of the anal fin. The upper parts are of a bluish color, the lower parts whitish. It sometimes attains a length of three feet, though it is usually much smaller. It is very swift, strong and voracious, preying on other fishes, of which it destroys many more than it really needs for food. Though found in many seas, it is best known along the Atlantic coast of the United States. Its flesh is much esteemed for the table. See *Britannica*, Vol. IX, p. 267.

**BLUE-GOWNS**, a name commonly given to a privileged class of mendicants in Scotland, whose proper designation was the king's headsmen—the persons employed to pray for the king having gradually degenerated into a class of authorized paupers. Each headsmen on the king's birthday received a gown of blue cloth, with a loaf of bread, a bottle of ale, and a leathern purse containing a penny for every year of the king's life. The most important part of the privilege was a pewter badge, attached to the breast of the gown, with the bearer's name and an inscription, *Pass and Repass*. This conferred the privilege of begging, and bespoke the kindly consideration of all to whom the headsmen appealed for alms or a night's lodging. The practice of appointing headsmen was discontinued in 1833; at that time there were 60 on the roll.

**BLUE GRASS**, the name of several species of *Poa*, a permanent grass found in Europe and North America. The blue grass of Kentucky, *P. pratensis*, is highly valued for pasturage and hay. It is also called June grass. The blue grass of England is *P. compressa*.

**BLUE-JAY** (*Cyanocitta cristata*), a common North American bird of the crow family. It is about 12 inches long, with a fine crest; the color is purplish-blue above, black on the neck and purplish-gray

below, the tail and wings blue spotted with black and white. It is a mischievous bird, but devours large numbers of injurious caterpillars. The common blue-jay has a wide distribution, and there are several other North American species. The long-tailed blue-jays belong to a rarer genus (*Xanthura*), found in Central and in South America. See Britannica, Vol. XIII, p. 611.

BLUE LAWS, once commonly believed to have been made by the colonial legislature of New Haven, were supposed to have prescribed unwarrantable rules for the dress, the private life, and the religious conduct of the colonists. It is certain, however, that no legal code of this description ever existed. The term itself, which is of uncertain origin, probably represented, in the minds of the people of various parts of colonial New England, the undue interference of the judges in the private affairs of citizens. It is said that Samuel Peters, D.D., in his *General History of Connecticut*, published in England in 1781, originated the story of the so-called blue laws of the New Haven colony.

BLUE LICK SPRINGS, a village and watering place of Kentucky, situated on Licking River, about 50 miles northeast of Lexington. It is noted for the medicinal virtues of its saline mineral springs.

BLUE MOUNTAINS, the name of a branch of the dividing range, New South Wales, which runs very nearly parallel with the coast, about 80 miles inland. It was not till 1813 that a practicable passage was found over them into the Bathurst plains. The highest point of the Blue mountains, Mount Beemarang, is 4,100 feet high, and some parts of the road which crosses them are 3,400 feet above the sea.

BLUE PILL, the most simple form in which mercury can be administered internally. It consists merely of two parts of mercury rubbed up with three parts of conserve of roses, till globules of mercury can no longer be detected. To this is added powdered hecree-root, so that a pill of five grains contains one grain of mercury. When taking blue pills all sudden changes of temperature should be avoided; and neither they nor any other form of mercury should be given without good cause, and without the greatest caution.

BLUE RAPIDS, a city of Kansas, situated on the Big Blue River, at the mouth of the Little Blue, about a hundred miles west of Atchison. A developed water-power of nearly two thousand horsepower drives extensive manufactories of flour, woolen goods, oil, and paper; and in the vicinity are valuable beds of water-lime and gypsum.

BLUE RIBBON, a term applied to any great prize—as the "Derby" stakes—from the blue ribbon worn by knights of the garter. *Blue Ribbon Army* was the name adopted, from the badge, by the association of total abstainers known as the Gospel Temperance Union.

BLUE RIDGE, the most easterly range of the Appalachians, U. S. It forms the continuation of the chain called South Mountain in Pennsylvania and Maryland. It is known as the Blue Ridge till it crosses the James River; thence to North Carolina as Allegheny Mountain; and in North Carolina again as Blue Ridge.

BLUE STOCKING, a name given to learned and literary ladies. The name is derived from a literary society formed in London about 1780, which included both men and women. A gentleman named Stillingleet, who was in the habit of wearing blue stockings, was a distinguished member of the society. The name has also been adopted in Germany and France.

BLUE SULPHUR SPRINGS, village and health resort of West Virginia, situated in Greenbrier

county. It is celebrated for the curative properties of its saline chalybeate waters.

BLUE-THROAT, or *Sylvia sylvia*, a handsome bird, somewhat larger than the robin. The upper part of its neck is of a brilliant blue, with a pure white spot in the center; below the blue is a black bar, then a line of white, and then a broad band of bright chestnut. In Lorraine and Alsace great numbers are caught for the table, and esteemed a delicacy. It has a very sweet song, and because it imitates to an unusual degree the notes of other birds the Laplanders gave it a name signifying the bird of a hundred tongues.

BLUE-WING, the blue-winged teal of North America, *Querquedula discors*, a small duck with blue wing-coverts. No member of the duck tribe is in higher esteem for the table.

BLUFFTON, a village of Indiana, county-seat of Wells county, situated on the south bank of the Wabash, about 25 miles south of Fort Wayne. It contains important manufactories of flour, woolen goods, barrels, barrel staves and heads, lumber, corn-planters and other machines, and a number of planing-mills and foundries. Bluffton enjoys excellent educational facilities, and is extensively engaged in trade in lumber, stock and grain.

BLUM, ROBERT, a German journalist and political agitator, born at Cologne in 1830, shot at Vienna, Nov. 9, 1849, for assisting in the uprising of the people in October. He was a man of strong character and his execution caused much indignation among the democrats in Germany.

BLUNDERBUSS, a kind of short musket with a very wide bore, sufficient to take in several shot or bullets at once. It has a limited range, but is very destructive at close quarters. As a military weapon it is chiefly of service in defending passages, door-ways, etc. Some of the English and German troopers of the 17th century were armed with the blunderbuss.

BLUNTSCHLI, JOHANN KASPAR (1808-81), Swiss jurist, born March 7, 1808, at Zurich, where in 1833 he became professor in the newly-founded University. He took an active part in the political struggles of his country, and in 1839 joined the Conservatives, of whom he was for a time an active leader. He was a counselor of state and became a member of the government and of the federal directory, and afterwards worked for the formation of a moderate Liberal-Conservative party in Switzerland. In 1848 he went to Munich as professor of civil and international law. There he published his *Allgemeines Staatsrecht* (5th ed., 1876), on which his reputation as a juriconsult chiefly rests; *Deutsches Privatrecht* (3d ed., 1864); and, in conjunction with Arndts and Pözl, *Kritische Ueberschau der Deutschen Gesetzgebung und Rechtswissenschaft* (6 vols., 1853-58). In 1861 he removed to Heidelberg University, and became a privy counselor of Baden, actively forwarding all liberal measures in the state. Liberty in ecclesiastical matters he had equally at heart; he acted several times as president of the *Protestantenverein*, and it was after delivering a closing speech at the general synod of Baden that he died suddenly at Karlsruhe, Oct. 21, 1881. He was the author of valuable histories of Zurich and of the Swiss Confederation, and of a number of works on law, being especially an authority on international law.

BOARDMAN, GEORGE DANA, born in Livermore, Me., Feb. 8, 1801, died in Burmah, Feb. 11, 1831. He was a clergyman's son, was a graduate of Waterville College, Me., and Andover Seminary, became a Baptist missionary and labored from 1825 to 1831 in Burmah. He overtaxed his strength and died from

consumption. His widow, Sarah Hall, married Dr. Adoniram Judson.

**BOARDMAN, GEORGE DANA**, son of the foregoing, born in Burmah, Aug. 8, 1828, graduated at Brown and then at the Newton Theological Institution. He became pastor of a Baptist church at Barnwell, S. C. His views on slavery led him to come North, where he became pastor of the Second Baptist church in Rochester, N. Y., and afterwards pastor of the First Church in Philadelphia. He has published books, sermons and addresses.

**BOARDMAN, HENRY AUGUSTUS**, born at Troy, N. Y., Jan. 9, 1808, died in Philadelphia, Pa., June 15, 1880. He graduated at Yale with highest honors, and in 1830 completed the course at Princeton Theological Seminary. He became pastor of the Tenth Presbyterian church in Philadelphia, and held the office from 1833 to 1876, when he was made pastor emeritus. He was the author of a large number of books.

**BOBCAYGEON**, an important lumbering town of Ontario, situated on an island which divides Sturgeon Lake from Pigeon Lake, about eighteen miles north of Lindsay. A canal passing through the village connects the lakes, and steamers ply regularly between Bobcaygeon and Lindsay.

**BOBOLINK**. See *Britannica*, Vol. XVIII, p. 53.

**BOB-WHITE**. See under *QUAIL*, *Britannica*, Vol. XX, pp. 146, 147.

**BOCCARDO, GIROLAMO**, born at Genoa, Italy, in 1829. He is one of the most voluminous and versatile writers of his age and nation. His writings include important works on political economy, geography, statistics, and history. See *POLITICAL ECONOMY*, *Britannica*, Vol. XIX, p. 387.

**BODIE**, a village of California, situated at an altitude of 8,320 feet, on a spur of the Sierra Nevada mountains, about a hundred miles south of Carson City. It was named from William Bodey, who discovered gold here in 1859. It is one of the most important gold-mining towns of the West.

**BODLE**, an ancient Scotch copper coin first issued under Charles II, and worth at that time two pennies Scotch, or one-sixth of an English penny; said to have been so called from the name of a mint-master of the name of Bothwell.

**BODMER, KARL**, an artist, born in Zurich, Switzerland, in 1805. He resides in Paris and Germany, where he paints landscapes and animal life. He spent two years in America, 1833-35, in the company of Prince Maximilian of Wied, and made sketches of Indians and forest scenes, which he has since utilized, and which have become exceedingly valuable; no artist of equal skill having up to that period visited the country west of the Mississippi.

**BODY-CAVITY**, in zoology, the general or common cavity of the body; the space inclosed by the body-walls of an animal. Special cavities, or those of particular organs, acquire special names.

**BODY-COLOR**, a term applied to such pigments as have body enough to be opaque, as distinguished from those which are transparent. As a general rule, pigments have more body the nearer they approach to white; consequently, the light parts of pictures in oil are in body color to give them brightness and strength, while the dark parts are transparent to give them depth. In water-color painting, works are said to be executed in body-colors when, instead of proceeding by transparent tints and washes, the pigments are mixed with white and thus rendered opaque.

**BODY'S ISLAND**, a long, narrow strip of sand, off North Carolina, with a light-house (156 feet), the highest in the United States.

**BOECKH, AUGUST**, a German antiquarian, born at Karlsruhe in 1785, died in 1867. He became professor of oratory and ancient literature at Berlin in 1810. He was one of the founders of the modern school of Greek historians, and his works are a vast storehouse of information concerning the industrial, social and domestic life of the ancient Greeks.

**BOEHLER, PETER**, a Moravian bishop, born at Frankfort-on-the-Main in 1712, died in London in 1775. He was the founder of Nazareth, a Moravian village of Pennsylvania. He is also well known in Methodist history for the decisive impulse given by him to the career of John Wesley.

**BOEHM, THEOBALD** (1802-81), a Bavarian musician, known as the inventor of important improvements in musical instruments, especially the flute. The Boehm flute is recognized as the best model for orchestral use, being more easily fingered and more even and accurate in tone than the common flute.

**BEHMERIA**, a genus of the natural order *Urticaceae*, of which the most important species, *B. nivea*, a shrubby plant of China and the East Indies, affords the valuable rhea-fiber or grass-cloth fiber. It has been successfully cultivated in the United States. The puyha fiber of the Himalayas is derived from *B. puyha*, now referred to the genus *Maoutia*.

**BOERNE**, a village and health resort of Texas, county-seat of Kendall county. It is pleasantly situated on the Rio Cibolo, about 30 miles northwest of San Antonio. The climate is genial, and the surrounding country is fertile and very picturesque.

**BOGARDUS, JAMES**, an American inventor, born in Catskill, N. Y., March 14, 1800, died in New York city, April 13, 1874. He was apprenticed to a watchmaker, and early showed the bent of his mind by improvements in the construction of eighth-day clocks, and by the invention of a delicate engraving machine. The dry gas-meter is his invention, as is also the transfer machine to produce bank-note plates from separate dies; and in 1839 his plan for manufacturing postage stamps was accepted by the British government. He subsequently introduced improvements in the manufacture of India-rubber goods, tools, and machinery, and invented a pyrometer, a deep-sea sounding machine, and a dynamometer. In 1847 he erected a factory in New York entirely of cast-iron, five stories high, which was the first of the kind ever built, and his success led him to engage in the erection of similar structures in other places.

**BOGERMANN, JOHANN** (1576-1633), the president of the famous Synod of Dort, born in 1576 at the Frisian village of Oplewert. After studying at Heidelberg and Geneva, he became pastor at Leeuwarden, and soon distinguished himself by the active part he took in the religious controversies of his time, especially that against Arminius. In 1618 he was elected president of the Synod of Dort, but his name is now remembered for the translation of the Bible into the vernacular, mainly by him, which soon became the standard Dutch version. He died in 1633, at Franeker, where he was primarily professor of divinity.

**BOGGS, CHARLES STUART**, a rear-admiral of the United States navy, born in New Brunswick, N. J., in 1811, died in 1888. He is distinguished as the commander of the *Varuna* during the passage of Forts Jackson and St. Philip and the taking of New Orleans in 1862.

**BOGLIPOOR**, or **BLAGULPORE**, a populous trading city in Bengal, India, situated on the right bank of the Ganges and distant by rail 265 miles from Calcutta. The city has an English seminary, silk

manufactories, several mosques and two unique circular towers of unknown origin.

BOGENHAUSEN, the site of the Royal Observatory of Munich. It is a village situated on the Isar, about two miles from that city.

BOGOS, a tribe of negroes who inhabit the highlands north of Abyssinia. They are estimated to number about 10,000. They are nominal Christians and are tributary to Abyssinia.

BOHTLINGK, OTTO, Sanskrit scholar, born of German ancestry at St. Petersburg. From 1835 to 1842 he studied oriental languages, especially Sanskrit, at Berlin and Bonn, and, after 26 years in his native city, settled in 1868 at Jena. Among his valuable works are the first European edition of the Indian grammarian Panini (1839), a Sanskrit chrestomathy (1845; 2d ed. 1877), and a great Sanskrit dictionary (7 vols., 1855-75).

BOIS DE BOULOGNE, a celebrated park, situated on the right bank of the Seine, about three miles west of Paris. It is the favorite rendezvous of the *élite* of that city and of its devotees of fashion and splendor. It suffered serious mutilation by fire and the axe during the siege of Paris in 1870.

BOISE CITY, the principal commercial city of Idaho, capital of the State, and county-seat of Ada county, beautifully situated on the Boise River, at the head of the fertile valley of the Snake River, about 50 miles above the confluence of those streams. It is the trade center of an important mining region, and of a rich agricultural and grazing country. It contains a United States assay office, and gold is the chief article of export. There is also a penitentiary, and several manufactories, principally for flour and lumber. The altitude of Boise City is nearly 3,000 feet, and its climate is mild. The town was settled in 1863. It was incorporated as a city in 1865. In the latter year it became the capital of Idaho, which was admitted as a State in 1890.

BOISE-DUVAL, JEAN, an eminent French physician and naturalist, born at Ticheville in 1801. He has published many valuable works on botany and entomology, and was noted for his valuable professional services during the cholera epidemic of 1835.

BOISSY D'ANGLAS, FRANÇOIS ANTOINE, COUNT, French statesman, born at St. Jean Chambre, in Ardèche, in 1756, died in Paris, Oct. 20, 1826. He was for some time major-domo to the Count of Provence (Louis XVIII), and a member of the States-general. During the Reign of Terror, fear of the "Mountain" kept him quiet; but, yielding to the solicitations of Tallien and Barrère, he joined the conspiracy against Robespierre. Two months after the execution of the tyrant he was elected secretary of the Convention, and shortly afterward a member of the Committee of Public Safety, in which capacity he displayed remarkable talent and discretion. He was subsequently president of the Council of Five Hundred; was called into the Senate by Napoleon, and was made a peer by Louis XVIII.

BOIVIN, MARIE (1773-1811), French midwife. She became a nun, but after the destruction of the nunnery at the Revolution, she devoted herself to midwifery. So distinguished was she as superintendent of the Maternity at Paris, that the king of Prussia conferred an order on her, and Marburg University the degree of M. D.

BOJADOR, CAPE, a headland on the west coast of Africa, in 26° 7' north latitude, 14° 29' west longitude. The Portuguese doubled this cape in 1482.

BOJANO, an ancient Italian town with a cathedral, situated on the Biferno, 13 miles southwest of Campobasso. Population, 3,506.

BOKER, GEORGE HENRY, author and diplomatist, born in Philadelphia Oct. 6, 1823, died there Jan. 2, 1890. After graduating at Princeton, he studied law and traveled in Europe; on his return wrote poems and plays, several of the latter being brought out successfully. Under Grant he served as minister to Turkey and also to Russia, and, returning in 1878, was elected president of the Union League, which, in 1862, he had helped to form. This position he occupied until his death.

BOKHARA, a Russian vassal state adjoining Turkestan and Afghanistan. Area, about 92,000 square miles; population, about 2,500,000; capital, Bokhara, with a population of 70,000.

The reigning sovereign is the Ameer Sayid Abdul Ahad, fourth son of the late Ameer, by a slave girl; born about 1860; educated in Russia; succeeded his father in 1885.

The modern state of Bokhara was founded by the Usbeks in the fifteenth century, after the power of the Golden Horde had been crushed by Tamurlane. The dynasty of Manguts, to which the present ruler belongs, dates from the end of the last century. In 1873 a treaty was signed, in virtue of which no foreigner was to be admitted to Bokhara without a Russian passport, and the state became practically a Russian dependency.

*Ameers of Bokhara*.—Sayid Ameer Hyder, 1799-1826; Mir Hussein, 1826; Mir Omar, 1826-27; Mir Nasrulla, 1827-60; Muzaffar-ed-Din, 1860-85.

Karshi has a population of 25,000, and Hissar 10,000. The religion is Mohammedan.

The Ameer has 25,000 troops, of which 4,000 are quartered in the city. A proportion of the troops are armed with Russian rifles and have been taught the Russian drill.

Bokhara produces corn, fruit, silk, tobacco, and hemp; and breeds goats, sheep, horses, and camels. The yearly produce of cotton is said to be about 32,000 tons; of silk 967 tons. Gold, salt, alum, and sulphur are the chief minerals found in the country. The exports of raw silk to India in one year are estimated at 34 tons. The exports of cotton in 1888 were 122,000 bales. By the treaty of 1873 all merchandise belonging to Russian traders, whether imported or exported, pays a duty of 2½ per cent. *ad valorem*. No other tax or import duty can be levied on Russian goods, which are also exempt from all transit duty. The Ameer has forbidden the import of spirituous liquors, except for the use of the Russian embassy.

The Russian Trans-Caspian Railway now runs through Bokhara from Charjui, on the Oxus, to a station within a few miles of the capital, and thence to Samarkand; the distance from Charjui to the Russian frontier station of Katti Kurghan being about 186 miles.

There is a telegraph line from Samarkand to Bokhara, the capital.

Russian paper roubles are current everywhere.

BOLAS (Spanish, "balls"), missiles used by the natives and *gauchos* of southern South America, and consisting of two heavy balls, generally of stone covered with leather, connected by a plaited thong 6 to 8 feet long. One bola is held in the right hand, while the other is swung rapidly round the head, at the full extent of the thong, and both are discharged at the animal to be captured, so as to wind round its feet and bring it to the ground. In another form of bolas there are three balls, differing in size, connected at the common center by three short thongs or ropes.

BOLERO, a Spanish national dance, invented in 1780 by the dancer Sebastian Zerezo. It is danced in moderately quick three-quarter time by two persons to the accompaniment of the castanets and
